

Solubility

1.	The solubility of a gas in water depends on	[MP PET 2002]
----	---	---------------

(a) Nature of the gas

(b) Temperature

(c) Pressure of the gas

(d) All of the above

2. Which of the following is not correct for D_2O

[Orissa JEE 2002]

(a) Boiling point is higher than $\,H_2O\,$

(b) D_2O reacts slowly than H_2O

(c) Viscosity is higher than H_2O at 25°

(d) Solubility of NaCl in it is more than H_2O

3. The statement "The mass of a gas dissolved in a given mass of a solvent at any temperature is proportional to the pressure of the gas above the solvent" is [AMU 2002]

(a) Dalton's Law of Partial Pressures

(b) Law of Mass Action

(c) Henry's Law

(d) None of these

4. Which is correct about Henry's law

[KCET 2002]

(a) The gas in contact with the liquid should behave as an ideal gas

(b) There should not be any chemical interaction between the gas and liquid $\,$

 $(c) \quad \text{The pressure applied should be high} \\$

(d) All of these

5. The statement "If 0.003 moles of a gas are dissolved in 900 g of water under a pressure of 1 atmosphere, 0.006 *moles* will be dissolved under a pressure of 2 atmospheres", illustrates[JIPMER 1999]

(a) Dalton's law of partial pressure

(b) Graham's law

(c) Raoult's law

(d) Henry's law

6.

The solution of sugar in water contains [BHU 1973]

(a) Free atoms(c) Free molecules

(b) Free ions

(d) Free atom and molecules

Method of expressing concentration of solution

1. $25\,ml$ of $3.0\,M\,HNO_3$ are mixed with $75\,ml$ of $4.0\,M\,HNO_3$. If the volumes are additive, the molarity of the final mixture would be [DPMT 1986; MH CET 2001]

(a) 3.25 M

(b) 4.0 M

(c) 3.75 M

(d) 3.50M

2. The amount of anhydrous Na_2CO_3 present in 250 ml of 0.25 M solution is [DPMT 2001]

(a) 6.225 g

(b) 66.25 g

(c) 6.0 g

(d) 6.625 g

3. Dilute one litre 1 molar H_2SO_4 solution by 5 litre water, the normality of that solution is [DPMT 1983]

(a) 0.2N

(b) 5 N

(c) 10 N

(d) 0.33 N

4. If 5.85 gms of NaCl are dissolved in 90 gms of water, the mole fraction of NaCl is

[CMC Vellore 1991; MP PMT 1994; AFMC 1998]

(a) 0.1

(b) 0.2

(c) 0.3

(d) 0.01

(e) 0.0190

5. The molarity of 0.006 mole of NaCl in 100ml solution is

[Bihar MEE 1996] (a) Normality (b) Molarity (a) 0.6 (b) 0.06 Mole fraction (d) Mass percentage (c) 0.006 (d) 0.066 (e) Molality (e) None of these The normality of 2.3 M H_2SO_4 solution is 20. [KCET 2000] $9.8\,g\,$ of $\,H_2SO_4\,$ is present in 2 $\it litres\,$ of a solution. The molarity 6. (a) 2.3 N (b) 4.6 N of the solution is [EAMCET 1991; MP PMT 2002] (c) 0.46 N (d) 0.23 N (a) 0.1M(b) 0.05M 21. The molarity of a solution made by mixing 50ml of conc. H_2SO_4 (c) 0.2*M* (d) 0.01*M* (36N) with 50 ml of water is [MP PMT 2001] 7. What will be the molarity of a solution containing 5g of sodium (a) 36 M (b) 18 M hydroxide in 250ml solution (c) 9 M (d) 6 M [MP PET 1999; BHU 1999; KCET 1999; 171 g of cane sugar $(C_{12}H_{22}O_{11})$ is dissolved in 1 litre of water. AllMS 2000: Pb. CET 2000 The molarity of the solution is [MP PMT 2001] (a) 0.5 (b) 1.0 (a) 2.0 M (b) 1.0 M (c) 2.0 (d) 0.1 (c) 0.5 M (d) 0.25 M 8. The normality of 0.3M phosphorus acid (H_3PO_3) is The volumes of 4 N HCl and 10 N HCl required to make 1 litre 23. [IIT 1999; AIIMS 2000] (b) 0.9 of 6 N HCl are (c) 0.3 (d) 0.6 (a) 0.75 litre of 10 N HCl and 0.25 litre of 4 N HCl Which of the following has maximum number of molecules 9. (b) 0.25 litre of 4 N HCl and 0.75 litre of 10 N HCl [CBSE PMT 2002] 0.67 litre of 4 N HCl and 0.33 litre of 10 N HCl (a) 16 gm of O_2 (b) 16 gm of NO_2 0.80 litre of 4 N HCl and 0.20 litre of 10 N HCl (c) $7 gm \text{ of } N_2$ (d) 2 gm of H_2 (e) 0.50 litre of 4 N HCl and 0.50 litre of 10 N HCl Molarity is expressed as [JIPMER 1991; CBSE PMT 1991] 10. Which statement is true for solution of 0.020 M H_2SO_A (a) Gram/litre (b) Moles/litre [DPMT 2001] (c) Litre/mole (d) Moles/1000 gms (a) 2 *litre* of the solution contains 0.020 *mole* of SO_4^{2-} 20ml of HCl solution requires 19.85ml of 0.01M NaOH 11. solution for complete neutralization. The molarity of HCl solution (b) 2 litre of the solution contains 0.080 mole of H_3O^+ [MP PMT 1999] (c) 1 *litre* of the solution contains 0.020 *mole* H_3O^+ (a) 0.0099 (b) 0.099 (c) 0.99 (d) 9.9 (d) None of these 10 litre solution of urea contains 240g urea. The active mass of urea 12. How much of NaOH is required to neutralise 1500 cm^3 of 0.1 N25. will be HCl (At. wt. of Na =23) (a) 0.04 (b) 0.02 (a) 4 g (b) 6 g (d) 60 g (d) 0.2 (c) 40 g (c) 0.4 If 5.85 g of NaCl (molecular weight 58.5) is dissolved in water and 13. 5 ml of N HCl, 20 ml of N/2 H_2SO_4 and 30 ml of N/3 HNO are the solution is made up to 0.5 litre, the molarity of the solution will be[AMU 1999; Pb PMT, 2000; AFMC 2001] mixed together and volume made to one litre. The normally of the (b) 0.4 (a) 0.2 resulting solution is [Kerala CET (Med.) 2003] (c) 1.0 (d) 0.1 A mixture has 18g water and 414g ethanol. The mole fraction of 5MP PMT 20001 water in mixture is (assume ideal behaviour of the mixture) (b) 0.4 (c) 0.7 (d) 0.9 2() [CBSE PMT 2002] The number of molecules in 4.25 g of ammonia is approximately (a) 0.5×10^{23} (b) 1.5×10^{23} (d) 2.5×10^{23} 3.5×10^{23} The amount of $K_2Cr_2O_7$ (eq. wt. 49.04) required to prepare 100 27. 16. The largest number of molecules is in [Kurukshetra CEE 1998] ml of its 0.05 N solution is [JIPMER 2002] (a) 25g of CO_2 (b) 46g of C_2H_5OH (a) 2.9424 g (b) 0.4904 g (c) 1.4712 g (d) 0.2452 g (c) 36g of H_2O (d) 54g of N_2O_5 With increase of temperature, which of these changes 17. If 1 M and 2.5 litre NaOH solution is mixed with another 0.5 M and If 1 *M* and 2.5 *litre NaOH* solution is lined with shorter 2.5 and 3 *litre NaOH* solution, then molarity of the resultant solution will be [CBSE PMT 2002]
(a) AIEEE 2002 Molality (a) 1.0 M (b) 0.73 M Weight fraction of solute (c) 0.80 M (d) 0.50 M (c) Fraction of solute present in water When a solute is present in trace quantities the following expression [Kerala CET (Med.) 2002] is used 25ml of a solution of barium hydroxide on titration with a 0.1molar 29. (b) Milligram percent (a) Gram per million solution of hydrochloric acid gave a litre value of 35 ml. The (c) Microgram percent (d) Nano gram percent molarity of barium hydroxide solution was (e) Parts per million [AIEEE 2003] When the concentration is expressed as the number of moles of a 19. (a) 0.07 (b) 0.14 solute per litre of solution it known as (c) 0.28 (d) 0.35 [Kerala CET (Med.) 2002]

- (d) None of these

Lowering of vapour pressure

1. Vapour pressure of CCl_4 at $25^{\circ}C$ is 143mm of $Hg\,0.5\,gm$ of a non-volatile solute (mol. wt. = 65) is dissolved in $100ml\,CCl_4$. Find the vapour pressure of the solution (Density of

 $CCl_4 = 1.58 \, g / cm^2)$

[CBSE PMT 1998]

- (a) 141.43 mm
- (b) 94.39 mm
- (c) 199.34 mm
- (d) 143.99 mm
- **2.** For a solution of volatile liquids the partial vapour pressure of each component in solution is directly proportional to
 - (a) Molarity
- (b) Mole fraction
- (c) Molality
- $(d) \quad Normality \\$
- 3. "The relative lowering of the vapour pressure is equal to the mole fraction of the solute." This law is called

[MP PET 1997, 2001]

- (a) Henry's law
- (b) Raoult's law
- (c) Ostwald's law
- (d) Arrhenius's law
- **4.** The relative lowering of vapour pressure produced by dissolving 71.5 g of a substance in 1000 g of water is 0.00713. The molecular weight of the substance will be

[DPMT 2001]

- (a) 18.0
- (b) 342

- (c) 60
- (d) 180
- 5. When mercuric iodide is added to the aqueous solution of potassium iodide, the [IIT 1987]
 - (a) Freezing point is raised
 - (b) Freezing point is lowered
 - (c) Freezing point does not change
 - (d) Boiling point does not change
- **6.** Vapour pressure of a solution is

[EAMCET 1988; MP PET 1994]

- (a) Directly proportional to the mole fraction of the solvent
- (b) Inversely proportional to the mole fraction of the solute
- (c) Inversely proportional to the mole fraction of the solvent
- (d) Directly proportional to the mole fraction of the solute
- When a substance is dissolved in a solvent the vapour pressure of the solvent is decreased. This results in

NCERT 1981

- (a) An increase in the b.p. of the solution
- (b) A decrease in the b.p. of the solvent
- (c) The solution having a higher freezing point than the solvent
- (d) The solution having a lower osmotic pressure than the solvent
- **8.** If P^o and P are the vapour pressure of a solvent and its solution respectively and N_1 and N_2 are the mole fractions of the solvent and solute respectively, then correct relation is
 - (a) $P = P^{\circ} N_1$
- (b) $P = P^{\circ} N_{\gamma}$
- (c) $P^o = P N_2$
- (d) $P = P^{o} (N_1 / N_2)$
- 9. An aqueous solution of methanol in water has vapour pressure
 - (a) Equal to that of water
 - (b) Equal to that of methanol
 - (c) More than that of water
 - (d) Less than that of water
- The pressure under which liquid and vapour can coexist at equilibrium is called the
 - (a) Limiting vapour pressure
 - (b) Real vapour pressure
 - (c) Normal vapour pressure
 - (d) Saturated vapour pressure
- 11. Which solution will show the maximum vapour pressure at 300 K
 - (a) 1 M $C_{12}H_{22}O_{11}$
- (b) 1 M CH₃COOH
- (c) 1 *M NaCl*₂
- (d) 1 M NaCl
- 12. The relative lowering of the vapour pressure is equal to the ratio between the number of

[EAMCET 1991; CBSE PMT 1991]

- (a) Solute moleules and solvent molecules
- (b) Solute molecules and the total molecules in the solution
- (c) Solvent molecules and the total molecules in the solution
- $(d) \quad \text{Solvent molecules and the total number of ions of the solute} \\$
- 13. $5cm^3$ of acetone is added to $100cm^3$ of water, the vapour pressure of water over the solution
 - (a) It will be equal to the vapour pressure of pure water
 - (b) It will be less than the vapour pressure of pure water
 - (c) It will be greater than the vapour pressure of pure water
 - (d) It will be very large
 - At 300 K, when a solute is added to a solvent its vapour pressure over the mercury reduces from 50 mm to 45 mm. The value of mole fraction of solute will be
 - (a) 0.005
- (b) 0.010
- (c) 0.100
- (d) 0.900
- A solution has a 1:4 mole ratio of pentane to hexane. The vapour pressure of the pure hydrocarbons at 20°C are 440 mmHg for pentane and 120 mmHg for hexane. The mole fraction of pentane in the vapour phase would be

[CBSE PMT 2005]

- (a) 0.549
- (b) 0.200
- (c) 0.786
- (d) 0.478
- 16. Benzene and toluene form nearly ideal solutions. At 20°C, the vapour pressure of benzene is 75 torr and that of toluene is 22 torr. The parial vapour pressure of benzene at 20°C for a solution containing 78g of benzene and 46g of toluene in torr is [AIEEE 2005]
 - (a) 50

(b) 25

(c) 37.5 (d) 53.5 The vapour pressure lowering caused by the addition of 100 g of 17. sucrose(molecular mass = 342) to 1000 g of water if the vapour pressure of pure water at 25° C is 23.8 mm Hg [RPET 1999] (a) 1.25 mm Hg (b) 0.125 mm Hg (c) 1.15 mm Hg (d) 00.12 mm Hg Which of the following is incorrect [] & K 2005] 18. (a) Relative lowering of vapour pressure is independent (b) The vapour pressure is a colligative property (c) Vapour pressure of a solution is lower than the vapour pressure of the solvent The relative lowering of vapour pressure is directly propertional to the original pressure 19. Among the following substances the lowest vapour pressure is exerted by (a) Water (b) Mercury (c) Kerosene (d) Rectified spirit

20. According to Raoult's law the relative lowering of vapour pressure of a solution of volatile substance is equal to

[CBSE PMT 1995; BHU 2001]

- (a) Mole fraction of the solvent
- (b) Mole fraction of the solute
- (c) Weight percentage of a solute
- (d) Weight percentage of a solvent
- When a substance is dissolved in a solvent, the vapour pressure of 21 the solvent is decreased. This results in

[MP PMT 1983; NCERT 1981]

- (a) An increase in the boiling point of the solution
- (b) A decrease in the boiling point of solvent
- (c) The solution having a higher freezing point than the solvent
- (d) The solution having a lower osmotic pressure than the solvent
- 22. The vapour pressure of a liquid depends on
 - (a) Temperature but not on volume
 - (b) Volume but not on temperature
 - (c) Temperature and volume
 - Neither on temperature nor on volume
- Which one of the statements given below concerning properties of 23. solutions, describes a colligative effect [AIIMS 2003]
 - Boiling point of pure water decreases by the addition of ethanol
 - (b) Vapour pressure of pure water decreases by the addition of nitric acid
 - Vapour pressure of pure benzene decreases by the addition of
 - Boiling point of pure benzene increases by the addition of toluene
- The atmospheric pressure is sum of the 24.

[Kerala CET (Med.) 2002]

- (a) Pressure of the biomolecules
- (b) Vapour pressure of atmospheric constituents
- (c) Vapour pressure of chemicals and vapour pressure of volatiles
- (d) Pressure created on to atmospheric molecules
- The vapour pressure of pure liquid A is 0.80 atm. On mixing a non-25. volatile B to A, its vapour pressure becomes 0.6 atm. The mole [MP PET 2003] fraction of B in the solution is
- (c) 0.50
- (d) 0.75
- 26. Lowering of vapour pressure is highest for
- [BHU 1997]

- (b) 0.1M glucose
- (c) $0.1 M MgSO_4$ (d) $0.1 M BaCl_2$
- An aqueous solution of glucose was prepared by dissolving 18 g of 27. glucose in 90 g of water. The relative lowering in vapour pressure is [KCET 2002]
 - (a) 0.02
- (b) 1

- (c) 20 (d) 180
- "Relative lowering in vapour pressure of solution containing nonvolatile solute is directly proportional to mole fraction of solute". Above statement is [AFMC 2004]
 - (a) Henry law
- (b) Dulong and Petit law
- (c) Raoult's law
- (d) Le-Chatelier's principle
- An ideal solution was obtained by mixing methanol and ethanol. If the partial vapour pressure of methanol and ethanol are 2.619kPa and 4.556kPa respectively, the composition of the vapour (in terms of mole fraction) will be

[Pb. PMT 1998]

- (a) 0.635 methanol, 0.365 ethanol
- 0.365 methanol, 0.635 ethanol
- 0.574 methanol, 0.326 ethanol
- 0.173 methanol, 0.827 ethanol
- The vapour pressure of two liquids P and Q are 80 and 600 torr, 30. respectively. The total vapour pressure of solution obtained by mixing 3 mole of P and 2 mole of Q would be

[CBSE PMT 2005]

- (a) 140 torr
- (b) 20 torr
- (c) 68 torr
- (d) 72 torr
- The vapour pressure of benzene at a certain temperature is 31. $640\,mm$ of Hg . A non-volatile and non-electrolyte solid weighing 2.175g is added to 39.08g of benzene. The vapour pressure of the solution is 600mm of Hg. What is the molecular weight of solid substance

[CBSE PMT 1999; AFMC 1999]

- (a) 49.50
- (b) 59.6
- (c) 69.5
- (d) 79.8
- Which one of the following is the expression of Raoult's law 32.

(a)
$$\frac{}{p} - \frac{}{n+N}$$

(b)
$$\frac{p_s - p}{p} = \frac{N}{N + n}$$

(a)
$$\frac{p-p_s}{p} = \frac{n}{n+N}$$
 (b)
$$\frac{p_s-p}{p} = \frac{N}{N+n}$$
 (c)
$$\frac{p-p_s}{p_s} = \frac{N}{N-n}$$
 (d)
$$\frac{p_s-p}{p_s} = \frac{N-n}{N}$$

(d)
$$\frac{p_s - p}{p_s} = \frac{N - n}{N}$$

p = vapour pressure of pure solvent

 p_s = vapour pressure of the solution

n = number of moles of the solute

N = number of moles of the solvent

- 33. Which has maximum vapour pressure [DPMT 2001]
 - (a) HI
- (b) HBr
- (c) HCl
- (d) *HF*
- When a non-volatile solute is dissolved in a solvent, the relative lowering of vapour pressure is equal to

[BHU 1979; IIT 1983]

- (a) Mole fraction of solute
- (b) Mole fraction of solvent
- Concentration of the solute in grams per litre
- (d) Concentration of the solute in grams 100 ml
- 60 gm of Urea (Mol. wt 60) was dissolved in 9.9 moles, of water. If the vapour pressure of pure water is P_o , the vapour pressure of solution is
 - (a) 0.10 P_a
- (b) 1.10 P_o
- (c) 0.90 P_o
- (d) 0.99 P_o
- The vapour pressure of water at $20^{\circ} C$ is 17.54 mm. When 20g of 36. a non-ionic, substance is dissolved in 100g of water, the vapour

pressure is lowered by 0.30 mm. What is the molecular weight of Which of the following liquid pairs shows a positive deviation from [UPSEAT 2001] the substances Raoult's law (a) 210.2 (b) 206.88 [MP PET 1993; UPSEAT 2001; AIEEE 2004] (c) 215.2 (d) 200.8 (a) Water-nitric acid (b) Benzene-methanol In an experiment, 1 g of a non-volatile solute was dissolved in 100 g(c) Water-hydrochloric acid (d) Acetone-chloroform of acetone (mol. mass = 58) at 298 K. The vapour pressure of the Which one of the following is non-ideal solution solution was found to be 192.5 mm Hg. The molecular weight of the (a) Benzene + toluene solute is (vapour pressure of acetone = 195 mm Hg) [CPMT 2001; CBSE PMT 2001; Pb CET 2002] n -hexane + n -heptane (a) 25.24 (b) 35.24 Ethyl bromide + ethyl iodide (c) 45.24 (d) 55.24 $CCl_{4} + CHCl_{3}$ How many grams of CH_3OH should be added to water to A non ideal solution was prepared by mixing 30 ml chloroform and 3. prepare 150ml solution of 2MCH₃OH [CRSE PMT 1004] 50 ml acetone. The volume of mixture will be [Pb. CET 2003] (a) > 80 ml(b) < 80 ml(a) 9.6 (c) = 80 ml(d) \geq 80 ml 9.6×10^{3} (d) 2.4×10^3 Which pair from the following will not form an ideal solution The vapour pressure of a solvent decreased by 10mm of mercury, when a non-volatile solute was added to the solvent. The mole (b) $H_2O + C_4H_9OH$ (a) $CCl_4 + SiCl_4$ fraction of the solute in the solution is 0.2. What should be the mole fraction of the solvent, if decrease in the vapour pressure is to be (c) $C_2H_5Br+C_2H_5I$ (d) $C_6H_{14} + C_7H_{16}$ 20mm of mercury [MP PMT 1996] An ideal solution is that which 5. [CBSE PMT 1998] (a) Shows positive deviation from Raoult's law (a) 0.8 (b) 0.6 (b) Shows negative deviation from Raoult's law (d) 0.2 (c) 0.4 (c) Has no connection with Raoult's law For a dilute solution, Raoult's law states that (d) Obeys Raoult's law [CPMT 1987; BHU 1979; IIT 1985; MP PMT 2004; Which one of the following mixtures can be separated into pure MNR 1988; AMU 2002] components by fractional distillation [CPMT 1987] The lowering of vapour pressure is equal to mole fraction of (a) (a) Benzene – toluene (b) Water - ethyl alcohol (c) Water - nitric acid (d) Water – hydrochloric acid The relative lowering of vapour pressure is equal to mole (b) [DPMT 1983; MP PET 1997] fraction of solute All form ideal solutions except The relative lowering of vapour pressure is proportional to the C_2H_5Br and C_2H_5I (b) C_6H_5Cl and C_6H_5Br amount of solute in solution (c) C_6H_6 and $C_6H_5CH_3$ (d) C_2H_5I and C_2H_5OH The vapour pressure of the solution is equal to the mole fraction of solvent Which property is shown by an ideal solution 8. The vapour pressure of a solvent A is 0.80 atm When a non-volatile [MP PET 2002] substance B is added to this solvent its vapour pressure drops to 0.6 (a) It [MR:RATR2000; 91]aw (b) $\Delta H_{mix} = 0$ atm. What is mole fraction of B in solution (a) 0.25 (c) $\Delta V_{mix} = 0$ (d) All of these (c) 0.75 (d) 0.90 When two liquid A and B are mixed then their boiling points Determination of correct molecular mass from Raoult's law is becomes greater than both of them. What is the nature of this applicable to solution (a) An electrolyte in solution (a) Ideal solution (b) A non-electrolyte in a dilute solution Positive deviation with non ideal solution (c) A non-electrolyte in a concentrated solution Negative deviation with non ideal solution (d) An electrolyte in a liquid solvent Normal solution If two substances A and B have $P_A^0: P_B^0 = 1:2$ and have mole In mixture A and B components show -ve deviation as AIEEE 2002 fraction in solution 1 : 2 then mole fraction of A in vapours [DPMT 2005] $\Delta \bar{V}_{\rm mix} > 0$ (a) 0.33 (b) 0.25 (c) 0.52 (d) 0.2 (b) $\Delta H_{\text{mix}} < 0$ A dry air is passed through the solution, containing the 10 gm of (c) A-B interaction is weaker than A-A and B-B interaction solute and 90 gm of water and then it pass through pure water. (d) A-B interaction is strong than A-A and B-B interaction There is the depression in weight of solution wt by 2.5 gm and in In which case Raoult's law is not applicable weight of pure solvent by 0.05 gm. Calculate the molecular weight

Ideal and Non-ideal solution

(e) 51

[MP PMT 1993]

- (b) $CH_3COOH + C_5H_5N$
- (c) $CHCl_3 + (C_2H_5)_2 O$
- (d) $H_2O + HNO_3$
- A mixture of liquid showing positive deviation in Raoult's law is 14.
 - (a) $(CH_3)_2 CO + C_2 H_5 OH$ (b) $(CH_3)_2 CO + CHCl_3$
 - (c) $(C_2H_5)_2O + CHCl_3$
- (d) $(CH_3)_2 CO + C_6 H_5 NH_2$
- All form ideal solution except 15.
- [UPSEAT 2001]
- (a) C_2H_5Br and C_2H_5I
- (b) C_2H_5Cl and C_6H_5Br
- (c) C_6H_6 and $C_6H_5CH_3$ (d) C_2H_5I and C_2H_5OH
- Formation of a solution from two components can be considered as 16.
 - (i) Pure solvent \rightarrow separated solvent molecules ΔH
 - (ii) Pure solute \rightarrow separated solute molecules ΔH
 - (iii) Separated solvent and solute molecules \rightarrow solution ΔH Solution so formed will be ideal if
 - (a) $\Delta H_{\text{soln}} = \Delta H_3 \Delta H_1 \Delta H_2$
 - (b) $\Delta H_{\text{soln}} = \Delta H_1 + \Delta H_2 + \Delta H_3$
 - (c) $\Delta H_{\text{soln}} = \Delta H_1 + \Delta H_2 \Delta H_3$
 - (d) $\Delta H_{\text{soln}} = \Delta H_1 \Delta H_2 \Delta H_3$
- Identify the mixture that shows positive deviation from Raoult's law [Kerala CET (Engs.) 2002]enthalpy of mixing is zero 17.

 - (a) $CHCl_3 + (CH_3)_2CO$ (b) $(CH_3)_2CO + C_6H_5NH_2$
 - (c) $CHCl_3 + C_6H_6$
- (d) $(CH_3)_2 CO + CS_2$
- (e) $C_6H_5N + CH_3COOH$
- When acetone is added to chloroform, then hydrogen bond is 18. formed between them. These liquids show
 - (a) Positive deviation from Raoult's law
 - (b) Negative deviation from Raoult's law
 - (c) No deviation from Raoult's law
 - Volume is slightly increased
- Which of the following is true when components forming an ideal 19. solution are mixed
 - (a) $\Delta H_m = \Delta V_m = 0$
- (b) $\Delta H_m > \Delta V_m$
- (c) $\Delta H_m < \Delta V_m$
- (d) $\Delta H_m = \Delta V_m = 1$
- 20. The liquid pair benzene-toluene shows [MP PET 1995]
 - (a) Irregular deviation from Raoult's law
 - (b) Negative deviation from Raoult's law
 - (c) Positive deviation from Raoult's law
 - (d) Practically no deviation from Raoult's law
- The solution which shows negative or positive deviation by Raoult's law, is called
 - (a) Ideal solution
- (b) Real solution
- (c) Non-ideal solution
- (d) Colloidal solution
- Which of the following does not show positive deviation from 22. Raoult's law [MP PMT 2000]
 - (a) Benzene-Chloroform
 - (b) Benzene-Acetone
 - (c) Benzene-Ethanol
 - Benzene-Carbon tetrachloride
- Which of the following mixture shows positive deviation by ideal 23. behaviour
 - (a) $CHCl_3 + (CH_3)_2 CO$
- (b) $C_6H_6 + C_6H_5CH_3$
- (c) $H_2O + HCl$
- (d) $CCl_4 + CHCl_3$
- Which property is not found in ideal solution 24.
 - (a) $P_A \neq P_A^o \times X_A$
- (b) $\Delta H_{mix} \neq 0$
- (c) $\Delta V_{mix} \neq 0$
- (d) All of these
- Which of the following is not correct for ideal solution 25.

- (a) $\Delta S_{mix} = 0$
- (b) $\Delta H_{mix} = 0$
- (c) It obeys Raoult's law
- (d) $\Delta V_{mix} = 0$
- Which of the following does not show negative deviation from 26. Raoult's law [MP PMT 2001]
 - (a) Acetone-Chloroform
- (b) Acetone-Benzene
- (c) Chloroform-Ether
- (d) Chloroform-Benzene
- A mixture of benzene and toluene forms (a) An ideal solution
 - (b) Non-ideal solution

- (c) Suspension

28.

- (d) Emulsion
- Which of the following is an ideal solution
- (a)
- Water + ethanol [**CBSE PMT 2003**] Chloroform + carbon tetrachloride
- Benzene + toluene (c)
- Water + hydrochloric acid (d)
- 29. When ethanol mixes in cyclohexane; cyclohexane intermolecular forces between ethanol molecule. In this, liquid pair
 - (a) Positive deviation by Raoult's law
 - Negative deviation by Raoult's law (b)
 - No deviation by Raoult's law (c)
 - Decrease in volume
 - Liquids A and B form an ideal solution [AIEEE 2003]
 - - (b) The entropy of mixing is zero
 - The free energy of mixing is zero (c)
 - The free energy as well as the entropy of mixing are each zero

Azeotropic mixture

- azeotropic $(b.p.100^{\circ} C)$ The mixture of water $HCl(b,p.85^{\circ}C)$ boils at $108.5^{\circ}C$. When this mixture is distilled it is possible to obtain [IIT 1981]
 - (a) Pure HCl
 - (b) Pure water
 - Pure water as well as pure HCl
 - (d) Neither HCl nor H_2O in their pure states
- An azeotropic solution of two liquids has boiling point lower than [NCERT 1978; IIT 1981] either when it
 - (a) Shows a negative deviation from Raoult's law
 - Shows no deviation from Raoult's law
 - Shows positive deviation from Raoult's law
 - (d) Is saturated
- A liquid mixture boils without changing constituent is called 3.

[DPMT 1982; CPMT 1987]

- (a) Stable structure complex
- (b) Binary liquid mixture
- Zeotropic liquid mixture
- (d) Azeotropic liquid mixture
- Azeotropic mixture are

- [CPMT 1982]
- (a) Constant temperature boiling mixtures
- (b) Those which boils at different temperatures
- Mixture of two solids
- (d) None of the above
- A mixture of two completely miscible non-ideal liquids which distil as such without change in its composition at a constant temperature as though it were a pure liquid. This mixture is known as
 - (a) Binary liquid mixture
- (b) Azeotropic mixture

- (c) Eutectic mixture
- (d) Ideal mixture

Osmosis and Osmotic pressure of the solution

- If 3 gm of glucose (mol. wt. 180) is dissolved in 60 gm of water at 15° C. Then the osmotic pressure of this solution will be
 - (a) 0.34 atm
- (b) 0.65 atm
- (c) 6.57 atm
- (d) 5.57 atm
- The concentration in gms per litre of a solution of cane sugar (M = 342) which is isotonic with a solution containing 6 gms of urea (M = 60) per *litre* is

[Orissa PMT 1989]

- (a) 3.42
- (b) 34.2
- (c) 5.7

- (d) 19
- Osmotic pressure is 0.0821 atm at temperature of $300 \, K$. Find 3. concentration in mole/litre [Roorkee 1990]
 - (a) 0.033
- (b) 0.066
- (c) 0.33×10^{-2}
- (d) 3
- Osmotic pressure of a solution containing 0.1 mole of solute per litre at 273K is (in atm)

 - (a) $\frac{0.1}{1} \times 0.08205 \times 273$ (b) $0.1 \times 1 \times 0.08205 \times 273$
 - (c) $\frac{1}{0.1} \times 0.08205 \times 273$ (d) $\frac{0.1}{1} \times \frac{273}{0.08205}$
- A solution contains non-volatile solute of molecular mass M_p . 5. Which of the following can be used to calculate molecular mass of the solute in terms of osmotic pressure (\emph{m} = Mass of solute, \emph{V} = Volume of solution and π = Osmotic pressure)
 - (a) $Mp = \left(\frac{m}{\pi}\right) VRT$ (b) $Mp = \left(\frac{m}{V}\right) \frac{RT}{\pi}$

 - (c) $Mp = \left(\frac{m}{V}\right) \frac{\pi}{RT}$ (d) $Mp = \left(\frac{m}{V}\right) \pi RT$
- 6. The osmotic pressure of a 5% (wt/vol) solution of cane sugar at $150^{\circ}C$ is [AMU 1999]
 - (a) 2.45 atm
- (b) 5.078 atm
- (c) 3.4 atm
- (d) 4 atm
- The relationship between osmotic pressure at 273 K when 10g7. glucose (P_1) , 10g urea (P_2) and 10g sucrose (P_3) are dissolved in 250ml of water is [CBSE PMT 1996]
 - (a) $P_1 > P_2 > P_3$ (c) $P_2 > P_1 > P_3$
- (b) $P_3 > P_1 > P_2$
- (d) $P_2 > P_3 > P_1$
- 8. In osmosis

- [DPMT 1985]
- Solvent molecules move from higher concentration to lower
 - Solvent molecules move from lower to higher concentration
- (c) Solute molecules move from higher to lower concentration
- (d) Solute molecules move from lower to higher concentration
- Semipermeable membrane is that which permits the passage of [BHU 1979; CPMT 1977] 844.96; MP.PMT 1994]

 - (a) Solute molecules only
 - (b) Solvent molecules only
 - Solute and solvent molecules both
 - Neither solute nor solvent molecules

- Two solutions A and B are separated by semi- permeable membrane. 10. If liquid flows form A to B then [MH CET 2000]
 - (a) A is less concentrated than B
 - (b) A is more concentrated than B
 - (c) Both have same concentration
 - (d) Normportings86]
 - A 5% solution of canesugar (mol. wt. =342) is isotonic with 1% solution of a substance X . The molecular weight of X is
 - (a) 34.2
- (b) 171.2
- (c) 68.4
- (d) 136.8
- Which of the following colligative properties can provide molar mass of proteins (or polymers or colloids) with greater precision[Kerala PMT 2004]
 - (a) Relative lowering of vapour pressure
 - Elevation of boiling point
 - Depression in freezing point
 - Osmotic pressure
 - Rast's method
- The average osmotic pressure of human blood is 7.8 bar at $37^{\circ} C$. What is the concentration of an aqueous NaCl solution that could be used in the blood stream [AIIMS 2004]
 - (a) $0.16 \ mol/L$
- (b) $0.32 \ mol / L$
- (c) $0.60 \ mol/L$
- (d) $0.45 \ mol/L$
- A solution of sucrose(molar mass = 342 g/mol) is prepared by dissolving 68.4 g of it per litre of the solution, what is its osmotic pressure ($R = 0.082 \ lit. \ atm. \ k^{-1} \ mol^{-1}$) at 273k

[UPSEAT 2001]

- (a) 6.02 atm
- (c) 4.04 atm

15.

- (d) 5.32 atm
- Blood has been found to be isotonic with
- [CPMT 1994]

- (a) No GBSE PMT 2001 tion
- (b) Saturated NaCl solution
- (c) Saturated KCl solution
- (d) Saturated solution of a 1:1 mixture of NaCl and KCl
- If 20 g of a solute was dissolved in 500 ml of water and osmotic 16. pressure of the solution was found to be 600 mm of Hg at $15^{\circ}C$, then molecular weight of the solute is

[BHU 2004]

- (a) 1000
- (b) 1200
- (c) 1400
- (d) 1800
- The osmotic pressure of 0.4% urea solution is 1.66 atm and. that of 17. a solution of suger of 3.42 % is 2.46 atm. When both the solution are mixed then the osmotic pressure of the resultant solution will be $[MP\ PMT\ I]$
 - (a) 1.64 atm
- (b) 2.46 atm
- (c) 2.06 atm
- (d) 0.82 atm
- 18. Blood is isotonic with (a) 0.16 *M* NaCl
- (b) Conc. NaCl
- (c) 50 % NaCl
- (d) 30 % NaCl
- Which inorganic precipitate acts as semipermeable membrane or 19. The chemical composition of semipermeable membrane is[CPMT 1984, 90; MP P
 - (a) Calcium sulphate
- (b) Barium oxalate
- (c) Nickel phosphate
- (d) Copper ferrocyanide
- The osmotic pressure of 1m solution at $27^{\circ}C$ is
- [CPMT 1999]

[DCE 2000]

- (c) 1.21 atm
- (b) 24.6 atm (d) 12.1 atm
- Osmotic pressure of a solution can be measured quickly accurately by [JIPMER 1991; CPMT 1983]
 - (a) Berkeley and Hartley's method

- (b) Morse's method
- (c) Pfeffer's method
- De Vries method
- The solution in which the blood cells retain their normal form are 22 [CBSE PMT 1991] with regard to the blood
 - (a) Isotonic
- (b) Isomotic
- (c) Hypertonic
- (d) Equinormal
- The osmotic pressure of a solution is given by the relation 23.

[CPMT 1983, 84, 87, 93, 94]

(a)
$$P = \frac{RT}{C}$$

(b)
$$P = \frac{CT}{R}$$

(c)
$$P = \frac{RC}{T}$$

(d)
$$\frac{P}{C} = RT$$

- The osmotic pressure of a solution is directly proportional to 24.
 - (a) The molecular concentration of solute
 - The absolute temperature at a given concentration
 - The lowering of vapour pressure (c)
 - All of the above
- 25. What would happen if a thin slice of sugar beet is placed in a concentrated solution of NaCl [CMC Vellore 1986]
 - (a) Sugar beet will lose water from its cells
 - (b) Sugar beet will absorb water from solution
 - Sugar beet will neither absorb nor lose water
 - (d) Sugar beet will dissolve in solution
- 26. The osmotic pressure of a dilute solution is given by

[MP PMT 1987]

- (b) $\pi V = nRT$
- (c) $\Delta P = P_o N_2$ (d) $\frac{\Delta P}{P_o} = \frac{P_o P}{P_o}$
- Which statement is wrong regarding osmotic pressure (P), volume 27. (V) and temperature (T)
 - (a) $P \propto \frac{1}{V}$ if T is constant
 - (b) $P \propto T$ if V is constant
 - (c) $P \propto V$ if T is constant
 - PV is constant if T is constant
- 28. Isotonic solutions have
- [DPMT 1984; MP PMT 1986]
- (a) Equal temperature (c) Equal volume
- (b) Equal osmotic pressure (d) Equal amount of solute
- Which of the following associated with isotonic solutions is not 29. [AMU 2002] correct
 - (a) They will have the same osmotic pressure
 - They have the same weight concentrations
 - Osmosis does not take place when the two solutions are separated by a semipermeable membrane
 - They will have the same vapour pressure
- Isotonic solution have the same 30.

[EAMCET 1979; JIPMER 1991, 2002; AFMC 1995; MP PMT 2002]

- (a) Density
- (b) Molar concentration
- (c) Normality
- (d) None of these
- 31. A 0.6% solution of urea (molecular weight = 60) would be isotonic with [NCERT 1982; DCE 2002]
 - 0.1M glucose
- (b) 0.1*M KCl*
- (c) 0.6% glucose solution
- (d) 0.6% KCl solution
- The value of osmotic pressure of a 0.2 M aqueous solution at 293K32. [AMU 2002]

- (a) 8.4 atm
- (b) 0.48atm
- (c) 4.8 atm
- (d) 4.0 atm
- Diffusion of solvent through a semi permeable membrane is called 33.
 - (a) Diffusion
- (b) Osmosis
- (c) Active absorption
- (d) Plasmolysis
- 34. Solutions having the same osmotic pressure under a given set of conditions are known as [BHU 1979; EAMCET 1979;

CPMT 1990; MP PMT 1999; AFMC 1999, 2001]

- (a) Hypertonic
- (b) Hypotonic
- (c) Normal
- (d) Isotonic
- 35. At low concentrations, the statement that equimolal solutions under a given set of experimental conditions have equal osmotic pressure is [EAMCET 1979: BHU 1979] true for
 - (a) All solutions
 - (b) Solutions of non-electrolytes only
 - Solutions of electrolytes only (c)
 - (d) None of these
- Which one of the following would lose weight on exposure to 36. atmosphere [NCERT 1975]
 - (a) Concentrated H_2SO_4
 - (b) Solid NaOH
 - A saturated solution of CO_2
 - (d) Anhydrous sodium carbonate
- 37. The molecular weight of NaCl determined by osmotic pressure method will be
 - Same as theoritical value
 - Higher than theoritical value
 - Lower than theoritical value
 - (d) None of these
- 38. The osmotic pressure of solution increases, if

[CPMT 1985, 87, 91]

- Temperature is decreased
- Solution concentration is increased
- Number of solute molecules is increased
- (d) Volume is increased
- 39. At the same temperature, following solution will be isotonic

[MP PMT 1985]

[CPMT 2004]

- 3.24 gm of sucrose per litre of water and 0.18 gm glucose per litre of water
- 3.42 gm of sucrose per litre and 0.18 gm glucose in 0.1 litre (b)
- 3.24 gm of sucrose per litre of water and 0.585 gm of sodium chloride per litre of water
- 3.42 gm of sucrose per litre of water and 1.17 gm of sodium chloride per litre of water
- The osmotic pressure of a decinormal solution of $BaCl_2$ in water 40. is
 - (a) Inversely proportional to its celsius temperature
 - Inversely proportional to its absolute temperature
 - Directly proportional to its celsius temperature
 - Directly proportional to its absolute temperature
- Blood cells will remain as such in 41. (a) Hypertonic solution
- (b) Hypotonic solution
- (c) Isotonic solution
- (d) None of these
- The osmotic pressure of a dilute solution is directly proportional to 42. [MP PMT 1987]
 - (a) Diffusion rate of the solute
 - lonic concentration
 - Elevation of B.P.

- (d) Flow of solvent from a concentrated to a dilute solution
- **43.** The osmotic pressure in atmospheres of 10% solution of canesugar at 69° C is

(a) 724

(b) 824

(c) 8.21

- (d) 7.21
- **44.** Which of the following molecules would diffuse through a cell membrane [NCERT 1978]
 - (a) Fructose
- (b) Glycogen
- (c) Haemoglobin
- (d) Catalase
- **45.** Two solutions of KNO_3 and CH_3COOH are prepared separately. Molarity of both is $0.1\,M$ and osmotic pressures are P_1 and P_2 respectively. The correct relationship between the osmotic pressures is [CPMT 1983, 84; Pb CET 2004]
 - (a) $P_2 > P_1$
- (b) $P_1 = P_2$
- (c) $P_1 > P_2$
- (d) $\frac{P_1}{P_1 + P_2} = \frac{P_2}{P_1 + P_2}$
- **46.** The osmotic pressure of a dilute solution of a non-volatile solute is
 - (a) Directly proportional to its temperature on the centigrade scale
 - (b) Inversely proportional to its temperature on the Kelvin scale
 - (c) Directly proportional to its temperature on the Kelvin scale
 - (d) Inversely proportional to its temperature on the centigrade scale
- **47.** Osmotic pressure of a urea solution at $10^{\circ}C$ is $500 \ mm$. Osmotic pressure of the solution become 105.3 mm. When it is diluted and temperature raised to $25^{\circ}C$. The extent of dilution is
 - (a) 6 Times
- (b) 5 Times
- (c) 7 Times
- (d) 4 Times
- **48.** If a 0.1M solution of glucose (mol. wt. 180) and $0.1\,\mathrm{molar}$ solution of urea (mol. wt. 60) are placed on the two sides of a semipermeable membrane to equal heights, then it will be correct to say [CBSE PMT 1992]
 - (a) There will be no net movement across the membrane
 - (b) Glucose will flow across the membrane into urea solution
 - (c) Urea will flow across the membrane into glucose solution
 - (d) Water will flow from urea solution into glucose solution
- 49. At constant temperature, the osmotic pressure of a solution
 - [CPMT 1986]
 - (a) Directly proportional to the concentration
 - (b) Inversely proportional to the concentration
 - (c) Directly proportional to the square of the concentration
 - (d) Directly proportional to the square root of the concentration
- 50. The solution containing $4.0\,gm$ of a polyvinyl chloride polymer in 1 litre of dioxane was found to have an osmotic pressure 6.0×10^{-4} atmosphere at $300\,K$, the value of R used is 0.082 litre atmosphere $mole^{-1}k^{-1}$. The molecular mass of the polymer was found to be [NCERT 1978]
 - (a) 3.0×10^2
- (b) 1.6×10^5
- (c) 5.6×10^4
- (d) 6.4×10^2
- **51.** Solvent molecules pass through the semipermeable membrane is called

[CPMT 1983; MP PMT 1987; RPET 2000; DCE 2004]

- (a) Electrolysis
- (b) Electrophoresis
- (c) Cataphoresis
- (d) Osmosis

52. If molecular weight of compound is increased then sensitivity is decreased in which of the following methods

[DCE 2001]

- (a) Elevation in boiling point(b) Viscosity
- (c) Osmosis
- (d) Dialysis
- **53.** If solubility of NaCl at $20^{\circ}C$ is 35 gm per 100 gm of water. Then on adding 50 gm of NaCl to the same volume at same temperature the salt remains undissolved is
 - (a) 15 *gm*
- (b) 20 gm
- (c) 50 gm
- (d) 35 gm
- **54.** Which of the following associated with isotonic solution is not correct
 - (a) They will have the same osmotic pressure
 - b) They have the same weight concentration
 - (c) Osmosis does not take place when the two solutions are separated by a semipermeable membrane
 - (d) They will have the same vapour pressure
- **55.** If osmotic pressure of a solution is 2atm at 273K, then at 546K [PPMERSHAPP] pressure is
 - (a) 0.5 atm
- (b) 1 atm
- (c) 2 atm
- (d) 4 atm
- **56.** In osmosis reaction, the volume of solution
 - (a) Decreases slowly
- (b) Increases slowly
- (c) Suddenly increases
- (d) No change
- **57.** As a result of osmosis the volume of solution

[JIPMER 2000]

- (a) Increases 2004]
- (c) Decreases
- (c) Remains constant
- (d) Increases or decreases
- 58. A solution of urea contain 8.6 gm/litre (mol. wt. 60.0). It is isotonic with a 5% solution of a non-volatile solute. The molecular weight of the solute will be [MP PMT 1986]
 - (a) 348.9
- (b) 34.89
- (c) 3489
- (d) 861.2
- 59. One mole each of urea, glucose and sodium chloride were dissolved in one litre of water Equal osmotic pressure will be produced by solutions of [MH CET 1999]
 - (a) Glucose and sodium chloride
 - (b) Urea and glucose
 - (c) Sodium chloride and urea
 - (d) None of these
- **60.** Which of the following aqueous solutions produce the same osmotic pressure [Roorkee 1999]
 - (a) 0.1 M NaCl solution
 - (b) 0.1 M glucose solution
 - (c) 0.6 g urea in 100 ml solution
 - (d) 1.0 g of a non-electrolyte solute (X) in 50 ml solution (Molar mass of X = 200)
- 61. Which of the following aqueous solutions are isotonic (R = 0.082 atm $K^{-1}mol^{-1})$ [Roorkee Qualifying 1998]
 - (a) 0.01*M* glucose
 - (b) $0.01 M NaNO_3$
 - (c) 500ml solution containing 0.3g urea
 - (d) 0.04 N HCl

Elevation of boiling boint of the solvent

1. The latent heat of vapourisation of water is $9700\,Cal\,/mole$ and if the *b.p.* is $100^o\,C$, ebullioscopic constant of water is

- (d) 2.86t6

Colligative properties of electrolyte

If O.P. of 1 M of the following in water can be measured, which one will show the maximum O.P.

[NCERT 1975; CPMT 1977; JIPMER 2001]

- (a) $AgNO_3$
- (b) $MgCl_2$
- (c) $(NH_4)_3 PO_4$
- (d) Na_2SO_4
- Which of the following solution in water possesses the lowest vapour pressure [BHU 1996]
 - (a) 0.1(M) NaCl
- (b) $0.1(N)BaCl_2$
- (c) 0.1(M)KCl
- (d) None of these
- Which of the following solutions in water will have the lowest vapour pressure [Roorkee 2000]
 - (a) 0.1 M, NaCl
- (b) 0.1 M, Sucrose
- (c) 0.1 M, BaCl₂
- (d) 0.1 M Na_3PO_4
- The vapour pressure will be lowest for
 - [CPMT 2004] (b) 0.1 M KCl solution
 - (a) 0.1 M sugar solution (c) 0.1 M $Cu(NO_3)_2$ solution
- (d) 0.1 M $AgNO_3$ solution
- Osmotic pressure of 0.1 M solution of NaCl and Na_2SO_4 will [AFMC 1978] he
 - (a) Same
 - Osmotic pressure of NaCl solution will be more than Na_2SO_4 solution
 - (c) Osmotic pressure of Na_2SO_4 solution will be more than
 - (d) Osmotic pressure of $NaSO_4$ will be less than that of NaCl
- Which of the following solutions has highest osmotic pressure
 - (a) 1 M NaCl
- (b) 1 M urea
- (c) 1 M sucrose

7.

- (d) 1 M glucose
- Which one has the highest osmotic pressure

[CBSE PMT 1991; DPMT 1991; MP PET 1994]

- (a) M/10HCl
- (b) M/10 urea
- (c) $M/10 BaCl_2$
- (d) M/10 glucose
- In equimolar solution of glucose, NaCl and $BaCl_2$, the order of osmotic pressure is as follow

[CPMT 1988, 93; MP PMT/PET 1988; MP PET 1997, 2003]

- (a) Glucose $> NaCl > BaCl_2$
- (b) $NaCl > BaCl_2 > Glucose$
- (c) $BaCl_2 > NaCl > Glucose$
- (d) Glucose $> BaCl_2 > NaCl$

The osmotic pressure of which solution is maximum (consider that deci-molar solution of each 90% dissociated)

[MP PMT 2003]

- (a) Aluminium sulphate
- Barium chloride
- Sodium sulphate
- A mixture of equal volumes of (b) and (c)
- At $25^{\circ}C$, the highest osmotic pressure is exhibited by 0.1M[CBSE PMT 1994; AllMS 2000]
- $CaCl_2$
- (b) KCl
- (c) Glucose
- (d) Urea

- Which of the following will have the highest boiling point at 1 atm 11. pressure [MP PET/PMT 1998] (a) 0.1 *M NaCl* (b) 0.1M sucrose (c) $0.1MBaCl_2$ (d) 0.1M glucose 12. Which one of the following would produce maximum elevation in boiling point 23. [MP PMT 1985; CPMT 1990; NCERT 1982] (a) 0.1 M glucose (b) 0.2 M sucrose (c) 0.1 M barium chloride (d) 0.1 M magnesium sulphate Which of the following solutions will have the highest boiling point[DPMT 299; CPW high] of the following will produce the maximum depression in 13. (a) 1% glucose (b) 1% sucrose (c) 1% NaCl (d) 1% CaCl₂ Which one of the following aqueous solutions will exhibit highest boiling point [AIEEE 2004] (b) $0.01 \, M \, KNO_3$ (a) 0.015 M urea 0.01 M Na₂SO₄(d) 0.015 M glucose 25. Which of the following aqueous solutions containing 10 gm of solute 15. in each case has highest B.P. NaCl solution (b) KCl solution (c) Sugar solution (d) Glucose solution 26. 16. 0.01 molar solutions of glucose, phenol and potassium chloride were prepared in water. The boiling points of Glucose solution = Phenol solution = Potassium chloride solution Potassium chloride solution > Glucose solution > Phenol solution 27. Phenol solution > Potassium chloride solution > Glucose solution Potassium chloride solution > Phenol solution > Glucose (c) KI Which one has the highest boiling point [CBSE PMT 1990] 17. 28. (a) $0.1N Na_2SO_4$ (b) $0.1NMgSO_4$ (c) $0.1MAl_2(SO_4)_3$ (d) $0.1MBaSO_4$ Which of the following solutions boils at the highest temperature 18. (b) 0.1 M NaCl (a) 0.1 M glucose (c) 0.1 *M BaCl*₂ (d) 0.1 M Urea 0.01M solution each of urea, common salt and Na_2SO_4 are 19. taken, the ratio of depression of freezing point is [Roorkee 1990] (a) 1:1:1 (b) 1:2:1 (c) 1:2:3 (d) 2:2:3 20. Which has the minimum freezing point [CPMT 1991] (a) One molal NaCl solution (b) One molal KCl solution (c) One molal CaCl₂ solution (d) One molal urea solution Which of the following has lowest freezing point 21. [NCERT 1981] 0.1 M aqueous solution of glucose 0.1 M aqueous solution of NaCl 0.1M aqueous solution of $ZnSO_4$ 0.1M aqueous solution of urea 22. The freezing points of equimolar solutions of glucose, KNO_3 and AlCl₃ are in the order of 3. [AMU 2000]
 - (a) $AlCl_3 < KNO_3 < Glucose$
 - (b) Glucose $< KNO_3 < AlCl_3$
 - Glucose $< AlCl_3 < KNO_3$
 - $AlCl_3 < Glucose < KNO_3$
 - Which of the following will have the highest F.P. at one atmosphere [BHU 1982; MP PMT 1987, MP PET/PMT 1988]
 - (a) 0.1M NaCl solution
- (b) 0.1M sugar solution
- (c) $0.1MBaCl_2$ solution
- (d) $0.1M FeCl_3$ solution

ing point of its aqueous solution

[MP PMT 1996]

- (a) 0.1M glucose
- (b) 0.1M sodium chloride
- 0.1M barium chloride
- 0.1M magnesium sulphate
- Which of the following has the lowest freezing point

[UPSEAT 2004]

- (a) 0.1 m sucrose
- (b) 0.1 m urea
- (c) 0.1 *m* ethanol
- (d) 0.1 m glucose
- Which of the following has minimum freezing point

[Pb. PMT 1999]

- (a) $0.1M K_2 C r_2 O_7$
- (b) 0.1 M $NH_{\perp}Cl$
- (c) 0.1 M $BaSO_4$
- (d) 0.1 $M Al_2(SO_4)_3$
- Which of the following 0.10m aqueous solution will have the [CBSE PMT 1997] lowest freezing point
 - (a) $Al_2(SO_4)_3$
- (b) $C_5 H_{10} O_5$

- (d) $C_{12}H_{22}O_{11}$
- For 0.1 ${\it M}\,$ solution, the colligative property will follow the order
 - $NaCl > Na_2SO_4 > Na_3PO_4$
 - $N_{4}N_{4}SO_{4} < Na_{3}PO_{4}$
 - $NaCl > Na_2SO_4 \approx Na_3PO_4$
 - $NaCl < Na_2SO_4 = Na_3PO_4$
- Which of the following will have the lowest vapour pressure
 - 0.1M KCl solution
 - 0.1M urea solution
 - $0.1M Na_2SO_4$ solution
 - (d) $0.1MK_4Fe(CN)_6$ solution

Abnormal molecular mass

- The Van't Hoff factor will be highest for
 - (a) Sodium chloride
- (b) Magnesium chloride
- (c) Sodium phosphate
- (d) Urea
- Which of the following salt has the same value of Van't Hoff factor *i* as that of $K_3[Fe(CN)_6]$

[CBSE PMT 1994; AIIMS 1998]

- (a) $Al_2(SO_4)_3$
- (b) NaCl
- (c) Na_2SO_4
- (d) $Al(NO_3)_3$
- When benzoic acid dissolve in benzene, the observed molecular mass

- (a) 244
- (b) 61
- (c) 366
- (d) 122
- The ratio of the value of any colligative property for KCl solution to that for sugar solution is nearly [MP PMT 1985]
 - (a) 1

(b) 0.5

(c) 2.0

- (d) 3
- Van't Hoff factor of $Ca(NO_3)_2$ is

(b) 2

(c) 3

- (d) 4
- Dry air was passed successively through a solution of 5~gm of a 6. solute in 80gm of water and then through pure water. The loss in weight of solution was $2.50\,gm$ and that of pure solvent 0.04~gm. What is the molecular weight of the solute

[MP PMT 1986]

[CPMT 1997]

- (a) 70.31
- (b) 7.143
- (c) 714.3
- (d) 80
- The Van't Hoff factor calculated from association data is 7. always...than calculated from dissociation data

[IIPMER 2000]

- (a) Less
- (b) More
- (c) Same
- (d) More or less
- 8. If α is the degree of dissociation of Na_2SO_4 , the Vant Hoffs factor (i) used for calculating the molecular mass is

[AIEEE 2005]

- (a) $1+\alpha$
- (c) $1+2\alpha$
- (d) $1-2\alpha$
- Van't Hoff factor i 9.
 - Normal molecular mass Observed molecular mass
 - Observed molecular mass Normal molecular mass
 - (c) Less than one in case of dissociation
 - (d) More than one in case of association
- Which of the following compounds corresponds Van't Hoff factor 10. 'i' to be equal to 2 for dilute solution [NCERT 1978]
 - (a) K_2SO_4
- (b) $NaHSO_A$
- (c) Sugar
- (d) $MgSO_4$
- The Van't Hoff factor i for a 0.2 molal aqueous solution of urea is 11.
 - (a) 0.2
- (b) 0.1

- (c) 1.2
- (d) 1.0
- One mole of a solute A is dissolved in a given volume of a solvent. 12. The association of the solute take place according to $nA \rightleftharpoons (A)_n$. The Van't Hoff factor i is expressed as

[MP PMT 1997]

- (a) i = 1 x
- (c) $i = \frac{1 x + \frac{x}{n}}{1}$
- Acetic acid dissolved in benzene shows a molecular weight of 13.
 - (a) 60
- (b) 120
- (c) 180
- (d) 240

The observed osmotic pressure of a solution of benzoic acid in 14. benzene is less than its expected value because

[CET Pune 1998]

- (a) Benzene is a non-polar solvent
- Benzoic acid molecules are associated in benzene
- Benzoic acid molecules are dissociated in benzene
- Benzoic acid is an organic compound
- The experimental molecular weight of an electrolyte will always be 15. less than its calculated value because the value of Van't Hoff factor "i" is [MP PMT 1993]
 - (a) Less than 1
- (b) Greater than 1
- (c) Equivalent to one
- (d) Zero
- The molecular mass of acetic acid dissolved in water is 60 and when dissolved in benzene it is 120. This difference in behaviour of CH3COOH is because [AMU 2000]
 - (a) Water prevents association of acetic acid
 - (b) Acetic acid does not fully dissolve in water
 - (c) Acetic acid fully dissolves in benzene
 - (d) Acetic acid does not ionize in benzene
- The correct relationship between the boiling points of very dilute 17. solutions of $AlCl_3(t_1)$ and $CaCl_2(t_2)$, having the same molar concentration is [CPMT 1983]
 - (a) $t_1 = t_2$
- (b) $t_1 > t_2$
- (c) $t_2 > t_1$
- (d) $t_2 \ge t_1$
- The Van't Hoff factor for sodium phosphate would be

(b) 2

(c) 3

- (d) 4
- The molecular weight of benzoic acid in benzene as determined by 19. depression in freezing point method corresponds to
 - (a) Ionization of benzoic acid
 - Dimerization of benzoic acid
 - Trimerization of benzoic acid
 - Solvation of benzoic acid

TCritical Thinking

- On adding solute to a solvent having vapour pressure 0.80 atm, vapour pressure reduces to 0.60 atm. Mole fraction of solute is
 - (a) 0.25
- (b) 0.75

Objective Questions

- (c) 0.50
- (d) 0.33
- A solution containing 30 gms of non-volatile solute in exactly 90 gm water has a vapour pressure of 21.85 mm Hg at 25° C. Further 18 gms of water is then added to the solution. The resulting solution has a vapour pressure of 22.15 mm Hg at $25^{\circ} C$. Calculate the molecular weight of the solute [UPSEAT 2001]
 - (a) 74.2
- (b) 75.6
- (c) 67.83
- (d) 78.7
- Vapour pressure of a solution of 5g of non-electrolyte in 100gof water at a particular temperature is $2985 \, N/m^2$. The vapour

[MPPET 1993, 02] the solute is $3000N/m^2$. The molecular weight of the solute is

(a) 60

- (b) 120
- (c) 180
- (d) 380

4. Azeotropic mixture of *HCl* and water has

[AFMC 1997; JIPMER 2002]

- (a) 84% HCl
- (b) 22.2% HCl
- (c) 63% HCl
- (d) 20.2% HCl
- 5. The osmotic pressure at 17^{o} C of an aqueous solution containing 1.75 g of sucrose per 150 ml solution is

BHU 2001]

- (a) 0.8 atm
- (b) 0.08 atm
- (c) 8.1 atm
- (d) 9.1 atm
- **6.** A 1.2 of solution of *NaCl* is isotonic with 7.2 of solution of glucose. Calculate the van't Hoff's factor of *NaCl* solution

[UPSEAT 2001]

- (a) 2.36
- (b) 1.50
- (c) 1.95
- (d) 1.00
- 7. $0.6 \, g$ of a solute is dissolved in $0.1 \, litre$ of a solvent which develops an osmotic pressure of 1.23 $\, atm$ at $\, 27^{\,o} \, C$. The molecular mass of the substance is [BHU 1990]
 - (a) $149.5 \, g \, mole^{-1}$
- (b) $120 \, g \, mole^{-1}$
- (c) $430 g mole^{-1}$
- (d) None of these
- **8.** The boiling point of a solution of 0.1050 gm of a substance in 15.84 gram of ether was found to be 100^{o} C higher than that of pure ether. What is the molecular weight of the substance [Molecular elevation constant of ether per 100 g = 21.6]
 - (a) 144.50
- (b) 143.18
- (c) 140.28
- (d) 146.66
- 9. Boiling point of chloroform was raised by 0.323 K, when 0.5143 g of anthracene was dissolved in 35 g of chloroform. Molecular mass of anthracene is

 $(K_b \text{ for } CHCl_3 = 3.9 \text{ kg mol})$

[Pb PMT 2000]

- (a) 79.42 g/mol
- (b) 132.32 g/mol
- (c) 177.42 g/mol
- (d) 242.32 g/mol
- 10. The boiling point of water $(100^{o}\,C)$ becomes $100.52^{o}\,C$, if 3 grams of a nonvolatile solute is dissolved in 200ml of water. The molecular weight of solute is

 $(K_b \text{ for water is } 0.6 K - m)$

[AIIMS 1998]

- $(a) \quad 12.2\,g\,mol^{-1}$
- (b) 15.4 g mol
- (c) $17.3 \, g \, mol^{-1}$
- (d) 20.4 g mol
- Normal boiling point of water is 373 K (at 760mm). Vapour pressure of water at 298 K is 23 mm. If the enthalpy of evaporation is 40.656 k/mole, the boiling point of water at 23 mm pressure will be [CBSE PMT 1995]
 - (a) 250 K
- (b) 294 K
- (c) 51.6 K
- (d) 12.5 K
- 12. A 0.2 molal aqueous solution of a weak acid (HX) is 20% ionised. The freezing point of this solution is (Given $K_f = 1.86^{\circ} \, C/m$ for water) [IIT 1995]
 - (a) $-0.31^{\circ} C$
- (b) $-0.45^{\circ} C$
- (c) $-0.53^{\circ} C$
- (d) $-0.90^{\circ} C$
- 13. A 0.001 molal solution of $[Pt(NH_3)_4 Cl_4]$ in water had a freezing point depression of $0.0054^{o}C$. If K_f for water is 1.80, the correct formulation for the above molecule is

[Kerala CET (Med.) 2003]

- (a) $[Pt(NH_3)_4 Cl_3]Cl$
- (b) $[Pt(NH_3)_4Cl]Cl_2$
- (c) $[Pt(NH_3)_4 Cl_2]Cl_3$
- (d) $[Pt(NH_3)_4 Cl_4]$

14. An aqueous solution of a weak monobasic acid containing 0.1 g in 21.7g of water freezes at 272.813 K. If the value of K_f for water is

1.86 K/m, what is the molecular mass of the monobasic acid [AMU 2002]

- (a) 50 g/mole
- (b) 46 g/mole
- (c) 55 g/mole
- (d) 60 *g/mole*
- 5. K_f of 1,4-dioxane is 4.9 mol^{-1} for 1000 g. The depression in freezing point for a 0.001 m solution in dioxane is

[DPMT 2001]

- (a) 0.0049
- (b) 4.9 + 0.001
- (c) 4.9
- (d) 0.49
- **16.** How many litres of CO_2 at STP will be formed when 100ml of $0.1MH_2SO_4$ reacts with excess of Na_2SO_3

[EAMCET 1998]

- (a) 22.4
- (b) 2.24
- (c) 0.224
- (d) 5.6
- 17. A solution is obtained by dissolving 12 g of urea (mol.wt.60) in a litre of water. Another solution is obtained by dissolving 68.4 g of cane sugar (mol.wt. 342) in a litre of water at are the same temperature. The lowering of vapour pressure in the first solution is [CPMT 2001]
 - (a) Same as that of 2 solution
 - (b) Nearly one-fifth of the 2- solution
 - (c) Double that of 2 solution
 - (d) Nearly five times that of 2- solution

Read the assertion and reason carefully to mark the correct option out of the options given below :

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
- (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
- (c) If assertion is true but reason is false.
- (d) If the assertion and reason both are false.
- (e) If assertion is false but reason is true.

Reason

Reason

1. Assertion : One molal aqueous solution of urea contains 60g of urea in 1kg $(1000\,g)$ water.

: Solution containing one mole of solute in 1000 g solvent is called as one molal solution.

2. Assertion : If 100 cc of 0.1NHCl is mixed with 100 cc of

 $0.2 \, N \, HCl$, the normality of the final solution will be 0.30.

Reason : Normalities of similar solutions like HCl can be added.

 $\hbox{3.} \qquad \hbox{Assertion} \qquad : \qquad \hbox{If a liquid solute more volatile than the solvent is} \\ \qquad \hbox{added to the solvent, the vapour pressure of the}$

solution may increase i.e., $p_s>p^o$. In the presence of a more volatile liquid solute,

only the solute will form the vapours and solvent will not.

4. Assertion : Azeotropic mixtures are formed only by nonideal solutions and they may have boiling points either greater than both the components or less

than both the components.

Reason : The composition of the vapour phase is same as that of the liquid phase of an azeotropic mixutre.

using boiling point or freezing point method. Polymers solutions do not possess a constant Reason boiling point or freezing point. 6. Assertion The molecular weight of acetic acid determined by depression in freezing point method in benzene and water was found to be different. Water is polar and benzene is non-polar. Reason and K^+ Assertion ions are responsible for maintaining proper osmotic pressure balance in the cells of organism. Reason Solutions having the same osmotic pressure are called isotonic solutions. 8. Assertion Reverse osmosis is used in the desalination of sea When pressure more than osmotic pressure is Reason applied, pure water is squeezed out of the sea water through the membrane. Camphor is used as solvent in the determination 9. Assertion of molecular masses of naphthalene, anthracene Reason Camphor has high molal elevation constant. 10. Assertion Elevation in boiling point and depression in freezing point are colligative properties. All colligative properties are used for the Reason calculation of molecular masses. 11. Assertion An increase in surface area increases the rate of evaporation. Stronger the inter-molecular attractive forces, Reason fast is the rate of evaporation at a given temperature. [AIIMS 2002] 12. Assertion The boiling and melting points of amides are higher than corresponding acids. Reason It is due to strong intermolecular hydrogen bonding in their molecules. [AIIMS 2002] 13. Assertion The freezing point is the temperature at which solid crystallizers from solution. The freezing point depression is the difference Reason between that temperature and freezing point of pure solvent. [AllMS 2000] 14. Assertion On adding NaCl to water its vapour pressure increases. Addition of non-volatile solute increases the Reason vapour pressure. [AllMS 1996] 15. Assertion Molar heat of vaporisation of water is greater Reason Molar heat of vaporisation is the amount of heat required to vaporise one mole of liquid at constant temperature. [AIIMS 1996] 16. Assertion Ice melts faster at high altitude. At high altitude atmospheric pressure is high. [AIIMS 1 Reason Molecular mass of benzoic acid when determined 17. Assertion by colligative properties is found high. Dimerisation of benzoic acid. [AIIMS 1998] Reason

Use of pressure cooker reduces cooking time.

Isotonic solution do not show the phenomenon

Isotonic solutions have equal osmotic pressure.

At higher pressue cooking occurs faster.

 CCl_4 and H_2O are immiscible.

 CCl_4 is a polar solvent.

of osmosis.

Molecular mass of polymers cannot be calculated

5.

18.

19.

20.

Assertion

Assertion

Assertion

Reason

Reason

Reason

Assertion

Assertion Increasing pressure on pure water decreases its

freezing point.

Reason Density of water is maximum at 273 K.

[AIIMS 2003]

Answers and Solutions

Method of expressing concentration of solution

1. (c)
$$M_1V_1 + M_2V_2 = MV$$

2. (d)
$$M = \frac{w}{m \times V(l)}$$
; $0.25 = \frac{w}{106 \times 0.25}$; $w = 6.625$ gm

3. (d)
$$N_1V_1 = N_2V_2$$

 $2 \times 1 = N_2 \times 6$
 $N_2 = 0.33$

4. (e)
$$5.85 \text{ g NaCl} = \frac{5.85}{58.5} \text{mole} = 0.1 \text{ mol}$$

 $90 \text{ g } H_2O = \frac{90}{18} \text{moles} = 5 \text{ moles}$

mole fraction of NaCl = $\frac{0.1}{5 + 0.1} \approx 0.0196$.

5. (b)
$$M = \frac{n}{V(l)} = \frac{0.006}{0.1} = 0.06$$

6. (b)
$$M = \frac{W \times 1000}{mol. mass \times \text{Volume in } ml.} = \frac{9.8 \times 1000}{98 \times 2000} = 0.05 M$$

7. (a)
$$M = \frac{W}{m.wt.} \times \frac{1000}{\text{Volume in } ml.} = \frac{5 \times 1000}{40 \times 250} = 0.5M$$

8. (d) Basicity of
$$H_3PO_3$$
 is 2. Hence 0.3 M $H_3PO_3 = 0.6 N$.

9. (d) 2 gm. Hydrogen has maximum number of molecules than others

n. (a)
$$M_1V_1 = M_2V_2$$

$$0.01 \times 19.85 = M_2 \times 20$$

$$M_2 = 0.009925 \; ; \; M = 0.0099 \; .$$

12. (b) $1500 \text{ } cm^3 \text{ of } 0.1 \text{ } N \text{ } HCI \text{ have number of } gm \text{ equivalence}$ $= \frac{N_1 \times V_1}{1000} = \frac{1500 \times 0.1}{1000} = 0.15$ $\therefore 0.15 \text{ } gm. \text{ equivalent of } NaOH = 0.15 \times 40 = 6 \text{ } gm.$

13. (a)
$$M = \frac{w}{m.wt. \times \text{volume in litre}} = \frac{5.85}{58.5 \times 0.5} = 0.2M$$

14. (a) Molecular weight of
$$C_2H_5OH=24+5+16+1=46$$
 Molecular mass of $H_2O=18$ 414 g of C_2H_5OH has $\frac{414}{46}=9$ mole 18 g of H_2O has $=\frac{18}{18}=1$ mole

15. (b)
$$17 \ gm \ NH_3 = 1 \ mole.$$

Molecules of
$$NH_3 = \frac{6.02 \times 10^{23} \times 4.25}{17} = 1.5 \times 10^{23}$$

17. (b)
$$(2.5 \times 1 + 3 \times 0.5) = M_3 \times 5.5$$

or $2.5 + 1.5 = M_3 \times 5.5$ or $M_3 = \frac{4}{5.5} = 0.73 \text{ M}.$

20. (b) Normality of
$$2.3 M H_2 SO_4 = M \times \text{Valency}$$

$$= 2.3 \times 2 = 4.6$$
 Λ

21. (c)
$$N_1V_1 = N_2V_2$$
, $36 \times 50 = N_2 \times 100$
$$N_2 = \frac{36 \times 50}{100} = 18$$
; $18N \ H_2SO_4 = 9M \ H_2SO_4$.

22. (c) Molarity =
$$\frac{w}{m.wt. \times \text{volume in litre}} = \frac{171}{342 \times 1} = 0.5M$$
.

23. (c)
$$N_1V_1 + N_2V_2 = NV$$

 $4x + 10(1-x) = 6 \times 1$; $-6x = -4$; $x = 0.66$

24. (b)
$$[H_3O^+] = 2 \times 0.02 = 0.04M$$

$$\therefore$$
 2 *litre* solution contains 0.08 mole of H_3O^+ .

25. (c) : 10 *litre* of urea solution contains 240 *gm* of urea : Active mass =
$$\frac{240}{60 \times 10} = 0.4$$
.

26. (d)
$$NV = N_1V_1 + N_2V_2 + N_3V_3$$
 or, $1000N = 1 \times 5 + \frac{1}{2} \times 20 + \frac{1}{3} \times 30$ or $N = \frac{1}{40}$

27. (d)
$$W = \frac{N \times eq.wt. \times V(ml)}{1000} = \frac{0.05 \times 49.04 \times 100}{1000} = 0.2452.$$

29. (a) For
$$HCIM = N = 0.1$$

$$N_1 V_1 = N_2 V_2$$
; $25 \times N_1 = 0.1 \times 35$

$$N_1 = \frac{0.1 \times 35}{25}$$
 ; $\therefore M = \frac{0.1 \times 35}{25 \times 2} = 0.07$.

30. (c) We know that

$$Molarity = \frac{Number of moles of solute}{Volume of solution in litre}$$

$$\therefore 2.0 = \frac{0.5}{\text{Volume of solution in } litre}$$

$$=\frac{0.5}{2.0}=0.250 litre=250 ml.$$

31. (a)
$$M = \frac{w}{m \times V(l)}$$
; $0.52 = \frac{w}{36.5 \times 0.15}$; $w = 2.84 \text{ gm}$

32. (c)
$$M = \frac{n}{V(l)}$$
; $0.5 = \frac{n}{2}$; $n = 1$

33. (d)
$$N = \frac{W}{M} = \frac{828}{46} = 18, n = \frac{w}{m} = \frac{36}{18} = 2$$

$$x_{H_2O} = \frac{n}{n+N} = \frac{2}{2+18} = \frac{2}{20} = 0.1$$

34. (a)
$$N = \frac{w \times 1000}{E \times \text{volume in } ml}$$
, $E = \frac{98}{3} = 32.6$
 $N = \frac{4.9 \times 1000}{32.6 \times 500} = 0.3 N$.

39. (b) Mole fraction of solute
$$=\frac{20}{80} = 0.25$$
.

40. (c)
$$N = \frac{w \times 1000}{m.wt. \times \text{Volume in } ml} = \frac{4 \times 1000}{40 \times 100} = 1.0 N.$$

41. (c)
$$M_1V_1 + M_2V_2 = M_3V_3$$
;
 $1.5 \times 480 + 1.2 \times 520 = M \times 1000$
 $M = \frac{720 + 624}{1000} = 1.344 M$.

44. (c)
$$m = \frac{18 \times 1000}{180 \times 500} = 0.2 m$$

45. (a) Molarity =
$$\frac{\% \times 10 \times d}{GMM} = \frac{22 \times 10 \times 1.253}{342} = 0.805M$$
. Normality = $\frac{\% \times 10 \times d}{GEM} = \frac{22 \times 10 \times 1.253}{342/6} = 4.83N$ Molality = $\frac{22 \times 1000}{342(100 - 22)} = 0.825m$

46. (a)
$$100 \text{ ml.}$$
 of $0.30M = \frac{100 \times 0.3}{1000} = 0.03 \text{ mole of } NaCl$

$$100 \text{ ml of } 0.40M = \frac{100 \times 0.4}{1000} = 0.04 \text{ mole of } NaCl$$
Moles of $NaCl$ to be added $= 0.04 - 0.03 = 0.01 \text{ mole}$

47. (c)
$$N = \frac{6 \times 1000}{40 \times 100} = 1.5 N$$

It is show highest normality than others.

48. (b)
$$M = \frac{n}{V(l)} \implies 0.8 = \frac{0.1}{V(l)} \implies V = 125 \, ml$$
.

50. (c) Strength of
$$H_2SO_4 = 98 \times 19.8 \text{ g/litre}$$

$$S = eq.wt. \times N; \quad N = \frac{S}{eq.wt.} = \frac{98 \times 19.8}{49} = 39.6$$

51. (c)
$$W = 1000 \text{ gm}$$
 (H_2O) ; $n = 1$ mole
$$N = \frac{W}{M} = \frac{1000}{18} = 55.55$$
$$x_{\text{Solute}} = \frac{n}{n+N} = \frac{1}{1+55.55} = 0.018.$$

55. (b) Mole fraction of
$$H_2O = \frac{\frac{80}{18}}{\frac{80}{18} + \frac{20}{34}} = \frac{68}{77}$$
.

59. (d) Volume strength =
$$\frac{1.5 \times 100}{17} = 8.82$$
.

60. (a)
$$n = \frac{w}{m}$$
; $w = n \times m = 0.25 \times 98 = 24.5 \, gm$

61. (d) Molar concentration
$$[H_2] = \frac{Mole}{V \text{ in } litre} = \frac{20/2}{5} = 2$$
.

- **62.** (a) Amount of $AgNO_3$ added in 60 ml of solution $= 60 \times 0.03 = 1.8 \ g$
- **63.** (a) $N = \frac{w}{E \times V(l)} \Rightarrow 0.1 = \frac{w}{100 \times 0.1} \Rightarrow w = 1 gm$
- **64.** (b) $N = \frac{w}{E \times V(I)} \Rightarrow 0.1 = \frac{w}{40 \times 0.25} \Rightarrow w = 1 \ gm$
- **65.** (a) $20 \times 0.4 = 40 \times N \text{ or } N = 0.2 \text{ or } M = \frac{0.2}{2} = 0.1 M$.
- **69.** (a) $M = \frac{w \times 1000}{m.wt. \times \text{Volume in } ml.} = \frac{10.6 \times 1000}{106 \times 500} = 0.2 M$.
- 72. (c) M.eq. of HCI = M.eq. of $CaCO_3$ $N \times 50 = \frac{1}{50} \times 1000 \; ; \; N = \frac{1 \times 1000}{50 \times 50} = 0.4 \, N$
- 73. (c) molality = $\frac{18}{180}$ = 0.1 molal.
- 74. (b) Molarity of $H_2SO_4=0.5$ Normality of H_2SO_4 (N_1) = $0.5\times 2=1$ $N_1V_1=N_2V_2$ $1\times 1=N_2\times 10$ or $N_2=\frac{1}{10}=0.1N$.
- **76.** (c) The density of solution $= 1.8 \ gm/ml$ Weight of one litre of solution $= 1800 \ gm$
 - $\therefore \text{ Weight of } H_2SO_4 \text{ in the solution} = \frac{1800 \times 90}{100} = 1620 \text{gm}$
 - :. Weight of solvent = 1800 1620 = 180 gm
 - \therefore Molality = $\frac{1620}{98} \times \frac{100}{180} = 9.18$
- 77. (a) Suppose the total volume of water = x $\therefore 100cm^3 \times 0.5N = x \times 0.1N$ 100×0.5

 $\therefore x = \frac{100 \times 0.5}{0.1} = 500cm^3$ Therefore the volume of water added

= Total volume -100cm³ = 500 - 100 = 400cm³.

- **78.** (b) $M_1 V_1 = M_2 V_2$, $M_2 = \frac{0.25 \times 25}{500} = 0.0125$.
- 79. (c) % by $wt.=\frac{wt. \text{ of the solute}(g)}{wt. \text{ of the solution}g} \times 100$ $= \frac{10}{90 + 10} \times 100 = 10$
- **80.** (b) Molality = $\frac{w}{m \times W} \times 1000 = \frac{18 \times 1000}{180 \times 250} = 0.4 \text{ m}$
- **81.** (d) Molality $(m) = \frac{w \times 1000}{mW} = 14.05$.
- **82.** (b) $N_1V_1 = N_2V_2$ $10 \times 10 = 0.1(10 + V)$ $V = \frac{10 \times 10}{0.1} 10 = 1000 10 = 990 \, ml.$
- **83.** (b) Sum of mole fraction is always 1.

- **84.** (b) An increases in temperature increase the volume of the solution and thus decreases its molarity.
- **85.** (d) 10^3 parts of $CaCO_3$ has number of parts = 10 10^6 parts of $CaCO_3$ has number of parts $= \frac{10}{10^3} \times 10^6 = 10,000 \ ppm \ .$
- **86.** (d) $X = \frac{n}{n+N}$ $n = \frac{w}{m} = \frac{3.65}{36.5} = 0.1, \quad N = \frac{W}{M} = \frac{16.2}{18} = 0.9$ $X = \frac{0.1}{0.1 + 0.9} = 0.1.$
- 87. (d) 10% glucose solution means $10 g = \frac{10}{180} mole$ in 100 cc. i.e., 0.1 litre

 Hence 1 mole will be present in $\frac{0.1 \times 180}{10}$ =1.8 litre.
- **88.** (e) For methyl alcohol N = M.
- **89.** (b) Mole fraction of glucose = $\frac{n}{n+N}$ = $\frac{0.01}{0.01+5}$ = 0.00199
- 90. (b) Mole of urea $=\frac{6.02 \times 10^{20}}{6.02 \times 10^{23}} = 10^{-3}$ moles

 Conc. of solution (in molarity) $=\frac{10^{-3}}{100} \times 1000 = 0.01 M$.

- 99. (b) Mole of $HCl = \frac{1.2046 \times 10^{24}}{6.023 \times 10^{23}} = 2 \, mole$ Normality = molarity × basidity or acicity = $2 \times 1 = 2N$

100. (d)
$$10 N = \text{Deca - normal}$$
, $\frac{1}{10} N = \text{Deci-normal}$.

101. (c) Molarity =
$$\frac{w \times 1000}{ml \text{ wt.} \times \text{Volume } ml.} = \frac{7.1 \times 1000}{142 \times 100} = 0.5 M$$
.

102. (d)
$$M = \frac{4 \times 10}{40} = 1 M$$

103. (d) Mole fraction
$$X = \frac{n}{n+N} = \frac{\frac{6}{60}}{\frac{6}{60} + \frac{180}{18}} = \frac{0.1}{10.1}$$

104. (c)
$$N = \frac{w \times 1000}{Eq.wt. \times \text{Volume}} = \frac{10 \times 1000}{60 \times 100} = 1.66 N$$

106. (b)
$$N = M \times \text{bosicity}$$
; $N = 2 \times 2 = 4$

108. (b) Concentration =
$$\frac{5 \times 10^6}{10^6}$$
 = 5 *ppm*.

110. (a)
$$H_3PO_3$$
 is a dibasic acid
$$N_1V_1 \text{ (acid)} = N_2V_2 \text{ (base)}$$

$$0.1 \times 2 \times 20 = 0.1 \times 1 \times V_2$$

$$\therefore V_2 = \frac{0.1 \times 2 \times 20}{0.1 \times 1} = 40 \, \text{mHz}$$

m. (d)
$$H_3PO_4 = H^+ + H_2PO_4^-$$

 $H_2PO_4^- = H^+ + HPO_4^{2-}$
 $HPO_4^{2-} = H^+ + PO_4^{3-}$

Phosphoric acid does not give 1N strength.

113. (c)
$$(H_2SO_4)\ N_1V_1=N_2V_2$$
 (dilute acid)
$$N_2=(10\times 36)/1000=0.36\ N\ .$$

114. (c)
$$H_2O_2 \to H_2O + \frac{1}{2}O_2$$

1 M H_2O_2 solution = $2N = 34$ $gm/litre = 11.2$
So Normality = $\frac{2 \times 10}{11.2} = 1.75$

115. (b) Weight = molarity \times m.wt. \times v = $1 \times 132 \times 2 = 264$ gm.

116. (a) Mole fraction
$$=\frac{n}{n+N}=\frac{\frac{w}{m}}{\frac{w}{m}+\frac{W}{M}} = \frac{\frac{1}{2}}{\frac{1}{2}+\frac{8}{32}}=0.667$$
.

118. (c) 98% H_2SO_4 means 98g H_2SO_4 in 100g solution. $\frac{100}{1.84}cc=54.3cc\;;\;\;98g\;H_2SO_4=1mol$ Hence molarity $=\frac{1}{54.3}\times1000=18.4M$

120. (d)
$$3 CaCl_2 + 2 Na_3 PO_4 \rightarrow Ca_3 (PO_4)_2 + 6 NaCl$$

 \therefore Mole of $Na_3 PO_4 = 3$ mole of $CaCl_2 = 1$ mole $Ca_3 (PO_4)_2$

 \therefore 0.2 mole of $Na_3PO_4=0.3$ mole of $CaCl_2=0.1$ mole of $Ca_3(PO_4)_2$.

121. (b)
$$\frac{X}{X + \frac{1000}{78}} = 0.2$$

122. (c)
$$C = \frac{6}{60} = 0.1$$
 molar.

123. (b) Molar solution of sulphuric acid is equal to 2N because it is show dibasic nature.

124. (a)
$$N = \frac{w \times 1000}{eq.wt. \times \text{volume in ml.}}$$
 $eq.wt. = \frac{106}{2} = 53$
 $w = \frac{0.5 \times 53 \times 500}{1000} = 13.25$.

125. (c) Molar concentration =
$$\frac{5.85 \times 1000}{58.5 \times 200} = 0.5 \, Molar$$
.

126. (c)
$$M = \frac{w \times 1000}{m.wt. \times V \text{ in } ml} = \frac{75.5 \times 1000}{56 \times 540} = 2.50 \text{ } M$$

129. (a)
$$N_1V_1=N_2V_2$$

$$10\times 10=0.1 \ \times \ \text{Volume of new solution}$$

$$\text{Volume of water}=\text{1000}-\text{10}=\text{990}\ \textit{ml}.$$

130. (b)
$$W = \frac{M \times m.w \, t. \times V}{1000} = \frac{0.1 \times 98 \times 400}{1000} = 3.92 \, g$$
.

131. (a) Molarity of pure water
$$=\frac{1000}{18} = 55.6 M$$
.

132. (c)
$$M = \frac{N}{2} = \frac{0.2}{2} = 0.1 M$$

133. (c) Moles of water
$$=\frac{180}{18} = 10 \, mole$$
.

134. (c) Mole fraction of
$$CO = \frac{n_{CO_2}}{n_{CO_2} + n_{N_2}} = \frac{\frac{44}{44}}{\frac{44}{44} + \frac{14}{28}} = \frac{2}{3}$$
.

136. (c)
$$M = \frac{w}{m \times V(l)} \Rightarrow 0.1 = \frac{w \times 4}{40 \times 1} \Rightarrow w = 1 gm$$

137. (c)
$$M = \frac{w \times 1 \, litre}{m.wt. \times \text{Volume } litre} = \frac{4 \times 1}{40 \times 0.1} = 1 \, M$$
.

138. (b) Number of moles =
$$\frac{w_1}{m_1} + \frac{w_2}{m_2} = \frac{90}{18} + \frac{300}{60} = 10$$

139. (a) The number of moles of solute dissolved in 1000 gm of the solvent is called molal solution.

140. (b)
$$w = \frac{0.1 \times 100 \times 392}{1000} = 3.92 g$$

141. (d)
$$\frac{18}{180 \times 1} = \frac{1}{10} = 0.1$$
 molal.

142. (c)
$$M = \frac{n}{V(l)} \Rightarrow 3 = \frac{n}{1} \Rightarrow n = 3$$
 moles.

143. (b) The unit of molality is mole per kilogram.

144. (a) 0.2 water + 0.8 ethanol; $X_A = \text{mole fraction of water}$,

 $X_B =$ mole fraction of ethanol

$$X_A = \frac{N_1}{N_1 + N_2}$$
 , $X_B = \frac{N_2}{N_2 + N_1}$

... Mole fraction of water = 0.2 and ethanol = 0.8.

Colligative properties

- **3.** (a) Osmotic pressure is colligative property.
- **5.** (c) Vapour pressure is not colligative property.

Lowering of vapour pressure

1. (a)
$$\frac{P^0 - Ps}{P^0} = \frac{w \times M}{m \ W} = 143 - \frac{0.5 \times 154}{65 \times 158} \times 143$$
$$= 143 - 1.03 = 141.97 \ mm \ .$$

4. (d)
$$\frac{P^0 - P_s}{P^0} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}}$$
 or $0.00713 = \frac{71.5/m}{\frac{71.5}{m} + \frac{1000}{18}}$

m = 180

- (b) HgI₂ although insoluble in water but shows complex formation with KI and freezing point is decreases.
- **6.** (a) For solutions containing non-volatile solutes, the Raoult's law may be stated as at a given temperature, the vapour pressure of a solution containing non-volatile solute is directly proportional to the mole fraction of the solvent.
- **7.** (a) Vapour pressure $\propto \frac{1}{\text{Boiling point}}$

When vapour pressure decreases then b.pt. increases.

- 9. (c) Methanol has low boiling point than $H_2{\cal O}$ Lower is boiling point of solvent more is vapour pressure.
- 11. (a) Sucrose will give minimum value of ΔP . $\Delta P = P^0 P_s \label{eq:deltaP}$

 $P_s = P^0 - \Delta P$ is maximum.

- **12.** (b) The relative lowering of the vapour pressure of dilute solution is equal to the mole fraction of the solute molecule present in the solution.
- 13. (b) Acetone solution has vapour pressure less than pure water.

15. (d)
$$P_T = P_p^0 x_p + P_h^0 x_h = 440 \times \frac{1}{5} + 120 \times \frac{4}{5}$$

= 88 + 96 = 184; $P_p^0 x_p = y_p P_T$; $\frac{88}{184} = y_p$
 $y_p = 0.478$

16. (a)
$$P_{.} = P_{B}^{o} X_{B}$$
; $\therefore P_{B} = \frac{\frac{78}{78}}{\frac{78}{78} + \frac{46}{92}} \times 75$; $\therefore P_{.} = 50 \text{ torm}$

17. (b) Given molecular mass of sucrose = 342

Moles of sucrose
$$=\frac{100}{342} = 0.292$$
 mole

Moles of water $N = \frac{1000}{18} = 55.5$ moles and

Vapour pressure of pure water $P^0 = 23.8 \, mm \, Hg$ According to Raoult's law

$$\frac{\Delta P}{P^0} = \frac{n}{n+N} \Rightarrow \frac{\Delta P}{23.8} = \frac{0.292}{0.292 + 55.5}$$
$$\Delta P = \frac{23.8 \times 0.292}{55.702} = 0.125 \text{ mm Hg.}$$

- 18. (d) According to Raoult's law, the relative lowering in vapour pressure of a dilute solution is equal to mole fraction of the solute present in the solution.
- **21.** (a) When vapour pressure of solvent decreases, then the boiling point of solvent increases.
- **25.** (b) According to Raoult's Law

$$\frac{P^0 - P_s}{P^0} = x_B \quad \text{(Mole fraction of solute)}$$

$$x_B = \frac{0.8 - 0.6}{0.8} = 0.25$$
.

- **26.** (d) $\frac{P^0 P_s}{P^0} = \text{molality} \times (1 \alpha + x\alpha + y\alpha)$ the value of $P^0 P_s$ is maximum for $BaCl_2$.
- 27. (a) $\frac{P^0 Ps}{P^0} = \frac{18 \times 18}{180 \times 90} = 0.02$.
- **30.** (d) $P_T = P_P^0 X_P + P_Q^0 X_Q$; $P_T = 80 \times \frac{3}{5} + 60 \times \frac{2}{5}$ $P_T = 48 + 24 = 72 \ torr$.
- 31. (c) $\frac{P^0 P_s}{P^0} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}} \quad \because \frac{W}{M} > \frac{w}{m} \quad \Rightarrow \frac{640 600}{640}$ $= \frac{w}{m} \times \frac{M}{W} \Rightarrow \frac{40}{640} = \frac{2.175 \times 78}{m \times 39.08} \quad ; m = \frac{2.175 \times 78}{39.08} \times \frac{640}{40}$ m = 69.45
- **33.** (c) The lower is boiling point more is vapour pressure; boiling point order, HCl < HBr < HI < HF
- 35. (c) $\frac{P^0 P_s}{P^0} = \frac{n}{N} \Rightarrow \frac{P^0 P_s}{P^0} = \frac{1}{9.9} \Rightarrow 9.9P^0 9.9P_s = P^0$ $8.9P^0 = 9.9P_s \Rightarrow P_s = \frac{8.9}{9.9}P^0 \approx 0.90P^0$
- 38. (a) 1000 ml of CH_3OH requires methanol = 32 g. 150 ml of 2 M CH_3OH requires methanol $= \frac{32}{1000} \times 150 \times 2 = 9.6 g .$
- **39.** (b) $\therefore P^0 P_s = P^0 \times \text{mole fraction solute}$ $10 = P^0 \times 0.2$; $20 = P^0 \times n \implies n = 0.4$ $\therefore N = 0.6$.
- **40.** (b) According to the Raoult's law for the non-volatile solute the relative lowering of vapour pressure of a solution containing a non-volatile is equal to the mole fraction of the solute.
- **43.** (d) Relationship between mole fraction of a component in the vapour phase and total vapour pressure of an ideal solution.

$$y_A = \frac{P_A}{P_{total}} = \frac{x_A . P_A^0}{x_A . P_A^0 + x_B . P_B^0}$$
$$= \frac{1 \times 1}{1 \times 1 + 2 \times 2} = \frac{1}{1 + 4} = \frac{1}{5} = 0.2$$

44. (c) Lowering in weight of solution \propto solution pressure

Lowering in weight of solvent $\propto P^0 - P_s$

(: $p^0 = \text{vapour pressure of pure solvent}$)

$$\frac{p^0 - p_s}{p_s} = \frac{\text{Loweringin weight of solvent}}{\text{Loweringin weight of solution}}$$

$$\frac{p^0 - p_s}{p_s} = \frac{w \times M}{m \times W}$$

$$\frac{0.05}{2.5} = \frac{10 \times 18}{90 \times m} \implies m = \frac{2 \times 2.5}{0.05} = \frac{2 \times 250}{5} = 100$$

Ideal and Non-ideal solution

(b) In solution showing positive type of deviation the partial pressure of each component of solution is greater than the vapour pressure as expected according to Raoult's law.

In solution of methanol & benzene methanol molecules are held together due to hydrogen bonding as shown below.

$$CH_3$$
 CH_3 CH_3 $-CH_3$ $-CH_3$

On adding benzene, the benzene molecules get in between the molecule of methanol thus breaking the hydrogen bonds. As the resulting solution has weak intermolecular attraction, the escaping tendency of alcohol & benzene molecule from the solution increases. Consequently the vapour pressure of the solution is greater than the vapour pressure as expected from Raoult's law.

3. (b) Chloroform & acetone form a non-ideal solution, in which A.....B type interaction are more than A.....A & B.....B type interaction due to H -bonding. Hence, the solution shows, negative deviation from Raoult's Law *i.e.*,

$$\Delta V_{mix} = -ve$$
; $\Delta H_{mix} = -ve$

 \therefore total volume of solution = less than (30 + 50 ml) or < 80 ml

- **4.** (b) H_2O and C_4H_9OH do not form ideal solution because there is hydrogen bonding between H_2O and C_4H_9OH .
- **6.** (a) Aromatic compound generally separated by fractional distillation. *e.g.* Benzene + Toluene.
- 7. (d) C_2H_5I and C_2H_5OH do not form ideal solution.
- 19. (a) For the ideal solution $\Delta H_{\rm mix}$ and $\Delta V_{\rm mix}=0$.
- **25.** (a) For the ideal solution ΔS_{mix} is not equal to zero.

Azeotropic mixture

- (d) Azeotropic mixture is constant boiling mixture, it is not possible to separate the components of azeotropic mixture by boiling.
- (d) Azeotropic mixture is a mixture of two liquids which boils at on particular temperature like a pure liquid and distils over in the same composition.

Osmosis and Osmotic pressure of the solution

- 1. (c) $\pi = CRT = \frac{3 \times 1000}{180 \times 60} \times 0.0821 \times 288 = 6.56 \text{ atm}$.
- 2. (b) Isotonic solution = $\frac{w_1}{m_1 V_1} = \frac{w_2}{m_2 V_2}$

$$= \frac{w_1}{342 \times 1} = \frac{6}{60 \times 1} = \frac{342 \times 6}{60} = 34.2.$$

- 3. (c) $\pi = CRT$, $C = \frac{\pi}{RT} = \frac{0.0821}{0.821 \times 300} = 0.33 \times 10^{-2}$.
- 4. (a) $\pi = \frac{w}{m} \times RT = \frac{0.1}{1} \times 0.0821 \times 273$
- **5.** (b) $\pi = \frac{n}{V}RT \Rightarrow M_P = \left(\frac{m}{V}\right)\frac{RT}{\pi}$
- **6.** (b) $C = \frac{5}{342} \times \frac{1}{100} \times 1000 = \frac{50}{342} \text{ mol/l}$ $\pi = \frac{50}{342} \times 0.082 \times 423 = 5.07 \text{ atm}$
- 7. (c) $P = \frac{w}{mv}R.T$ since wvT are constant thus $P \propto \frac{1}{m}$

$$P_2 > P_1 > P_3$$
.

- **8.** (b) In the osmosis solvent molecule move from lower concentration to higher concentration.
- **10.** (a) Osmosis occur from dilute solution to concentrate solution. Therefore solution *A* is less concentrated than *B*.
- 11. (c) Molar concentration of cane sugar $=\frac{5}{342} \times \frac{1000}{100} = \frac{50}{342}$

Molar concentration of
$$X = \frac{1}{m} \times \frac{1000}{100} = \frac{10}{m}$$

$$\frac{10}{m} = \frac{50}{342}$$
 or $m = 68.4$.

- 12. (d) Osmotic pressure method is especially suitable for the determination of molecular masses of macromolecules such as protein & polymer because for these substances the value of other colligative properties such as elevation in boiling point or depression in freezing point are too small to be measured on the other hand osmotic pressure of such substances are measurable.
- 13. (b) $\pi = CRT$; $C = \frac{\pi}{RT} = \frac{7.8}{.082 \times 310} = 0.31 mol/litre$
- 14. (b) $\pi = CRT$ $\pi = \frac{w \times R \times T}{mV} = \frac{68.4 \times 0.0821 \times 273}{342} = 4.92 \text{ atm}$
- 16. (b) $\pi = \frac{n}{V}RT = \frac{m/MRT}{V}$ $\frac{600}{760} = \frac{20 \times 0.0821 \times 288 \times 1000}{500 \times M}; M = 1200$
- 17. (c) $\pi = \frac{1.66 + 2.46}{2} = 2.06 atm$
- **19.** (d) Copper ferrocyanide *ppt.* acts as a semipermeable membrane.
- **20.** (b) Osmotic pressure = CRT where C = 1 m $\pi = CRT = 1 \times 0.0821 \times 300 = 24.6 atm$
- **23.** (d) P = CRT or $\frac{P}{C} = RT$
- **24.** (d) $\pi = CRT$ or $\pi = \left(\frac{P^0 P_s}{P^0}\right) \times \frac{dRT}{M}$
- **31.** (a) Isotonic solutions are those which have same concentration.
- **32.** (c) $\pi = CRT = 0.2 \times 0.0821 \times 293 = 4.81$ atm.
- **35.** (b) Equal osmotic pressure only applicable of non-electrolytes solution at low concentration.
- **38.** (c) As soon as the solute molecules increases the osmotic pressure of solution increase.
- **41.** (c) Living cells shrinks in hypertonic solution (plasmolysis) while bursts in hypotonic solution (endosmosis). There is no. effect when living cells are kept in isotonic solution.
- **43.** (c) $\pi V = nRT$ $\pi = \frac{w}{m} \frac{RT}{V} = \frac{10}{342} \times \frac{0.821 \times (273 + 69)}{0.1} = 8.21 \text{ atm.}$
- **45.** (c) KNO_3 dissociates completely while CH_3COOH dissociates to a small extent. Hence, $P_1 > P_2$.
- **47.** (b) $\pi V = nRT$ $\frac{500V_1}{105.3V_2} = \frac{nR \times 283}{nR \times 298} \; ; \; \frac{V_1}{V_2} = \frac{1}{5} \; \text{so} \; V_2 = 5V_1$

- **48.** (a) There is no net movement of the solvent through the semipermeable membrane between two solution of equal concentration.
- **50.** (b) $\pi V = \frac{w}{m}RT$ $\therefore 6 \times 10^{-4} \times 1 = \frac{4}{m} \times 0.0821 \times 300 \; ; \; m = 1.64 \times 10^{5} \, .$
- **52.** (d) According to the dialysis process molecular weight increases but sensitivity decreases.
- **55.** (d) $\pi \propto T$; if T is doubled π is also doubled.
- **56.** (b) Osmosis reaction are takes place in increases the volume.
- **58.** (a) For two non-electrolytic solution if isotonic, $C_1 = C_2$ $\therefore \frac{8.6}{60 \times 1} = \frac{5 \times 1000}{m.wt. \times 100} \quad \therefore \quad m = 348.9$
- **59.** (b) Both urea and glucose are non-electrolytes but *NaCl* being electrolyte ionises.

Elevation of boiling point of the solvent

- 1. (a) $K_b = \frac{M_1 R T_0^2}{1000 \ \Delta H_V} = \frac{18 \times 1.987 \times (373)^2}{1000 \times 9700} = 0.513^{\circ} C$
- 2. (b) $\Delta T_b = imk_b = 0.52 \times 1 \times 2 = 1.04$. $\therefore T_b = 100 + 1.04 = 101.04^{\circ} C$.
- 3. (c) $K_b = \frac{\Delta T_b}{m} = \frac{0.1 \times 100}{\frac{1.8}{180} \times 1000} = 1 \, K/m$.
- $\text{4.} \qquad \text{(d)} \quad m = \frac{K_b \times w \times 1000}{\Delta T_b \times W} = \frac{2.16 \times 0.15 \times 1000}{0.216 \times 15} = \text{100} \ .$
- **5.** (b) Due to higher pressure inside the boiling point elevated.
- (b) Dissolution of a non-volatile solute raises the boiling pt. of a liquid.
- **7.** (b) As we know that

Boiling point $\propto \frac{1}{\text{vapour pressure of liquid}}$

Hence, on decreasing vapour pressure, boiling point will increase

- 8. (b) $\Delta T_b = \frac{100 \times K_b \times w}{m \times W}$ $\therefore 0.52 = \frac{100 \times 5.2 \times 6}{m \times 100}$ $m = \frac{100 \times 5.2 \times 6}{0.52 \times 100} = 60$.
- 10. (b) Elevation in a boiling point is a colligative property as it depends upon the number of particles.

 $\Delta T_{s} \propto n$

For sucrose, n = 1, $\Delta T_{\perp} = 0.1^{\circ} C$ For NaCl, n = 2, $\Delta T = 0.2^{\circ} C$

- 11. (b) $\Delta T_b = K_b \times m$ or $K_b = \Delta T_b / m$
- 12. (c) $\Delta T_b = K_b \times m = 0.513 \times \left(\frac{0.1}{200} \times 1000\right)$ = 0.2565 °C, $T_b = 100.256$ °C
- 15. (a) $\Delta T_{\cdot} = i.K.m$ $CuC! \longrightarrow Cu + 2C!$ $1 \qquad 0 \qquad 0$ $(1-\alpha) \qquad \alpha \qquad 2\alpha$ $i = 1 + 2\alpha$ Assuming 100% ionization

- So, i = 3 $\Delta T = 3 \times 0.52 \times 0.1 = 0.156 \approx 0.16$
- 16. (d) $\Delta T_b = \frac{K_b \times w \times 1000}{m \times W}$ $m = \frac{K_b \times w \times 1000}{\Delta T_b \times W} = \frac{2.53 \times 10 \times 1000}{1 \times 100} = 253g$
- **18.** (b) Common salt is non-volatile and rises the b.pt.
- 19. (b) In the process of evaporation, high energy molecules leave the surface of liquid, hence average kinetic energy and consequently the temperature of liquid falls.
- **20.** (a) The boiling occurs at lowers temperature if atmospheric pressure is lower than 76*cm Hg*.
- **23.** (b) $BaCl_2$ furnishes more ions than KCl and thus shows higher boiling point $T_1 > T_2$.

Depression of freezing point of the solvent

1. (c) $\Delta T_f = K_f \times \text{molality} = 1.86 \times 0.05 = 0.093 \,^{\circ} C$

Thus freezing point = $0 - 0.093 = -0.093^{\circ} C$.

- 2. (c) $\Delta T_f = \frac{100 \times K \times w}{m \times W}$ $\therefore 0.186 = \frac{100 \times 18.6 \times w}{60 \times 500}$ w = 3g
- **3.** (a) Camphor has the maximum value of $K_f (= 39.7)$.
- 4. (d) The extent of depression in freezing point varies with the number of solute particles for a fixed solvent only and it is a characteristics feature of the nature of solvent also. So for two different solvents the extent of depression may vary even if number of solute particles be dissolved.
- **6.** (a) Molar mass $=\frac{K_f \times 1000 \times w}{\Delta T_f \times W} = \frac{1.86 \times 1000 \times 1.25}{20 \times 1.1}$ = 105.68 = 105.7.
- 7. (b) $HBr = H^+ + Br^- \ (1-\alpha) = \alpha \alpha$ $Total = 1 + \alpha : i = 1 + \alpha = 1 + 0.9 = 1.9$ $\Delta T_f = iK_f \times m = 1.9 \times 1.86 \times \frac{8.1}{81} \times \frac{1000}{100} = 3.53^{\circ} C$ $T_f = -3.53^{\circ} C.$
- **8.** (b) $\Delta T_f = K_f \times m = 1.86 \times 0.1 = 0.186$.
- **9.** (b) Freezing point is lowered on addition of solute in it..
- 10. (d) $\Delta T_b = 0.18$; $\Delta T_b = mK_b$ $\frac{0.18}{\Delta T_f} = \frac{mK_b}{m K_f}$; $\frac{0.18 \times 1.86}{0.512} = \Delta T_f$; $\Delta T_f = 0.653$ $T^0 T_s = 0.653$; $T^0 T_s = 0.653$; $T_s = 0 0.653^\circ C$.
- 11. (a) $\Delta T_f = 1.86 \times \left(\frac{342}{342}\right) = 1.86^o$; $T_f = -1.86^o$ C.
- 12. (b) $\Delta T_b = K_b \times m$ i.e. $0.52 = 0.52 \times m$ $\Delta T_f = K_f \times m = 1.86 \times 1 = 1.86 ; T_f = -1.86^o C.$
- 13. (b) For NaCl i = 2 $\Delta T_f = 2K_f m = 2 \times 1.86 \times 1 = 3.72$

$$T_s = T - \Delta T_f = 0 - 3.72 = -3.72$$
°C

- 15. (b) $\Delta T_f=K_f\times m \implies 0.186=1.86\times m$ So m=0.1, Put the value of m in $\Delta T_b=K_b\times m$ $\Delta T_b=0.521\times (0.1)=0.0521$
- 17. (a) Dissolution of a non-volatile solute lowers the freezing pt. of the solution H_2O .
- **20.** (a) By using, $m = \frac{K_f \times 1000 \times w}{\Delta T_f \times W_{\text{Solvent}} \ (gm)} = \frac{5.12 \times 1000 \times 1}{0.40 \times 50}$ = 256 gm/mol

Hence, molecular mass of the solute = $256 \, gmmol^{-1}$

- **21.** (a) $m = \frac{K_f \times w \times 1000}{\Delta T_f \times W} = \frac{5.12 \times 0.440 \times 1000}{0.567 \times 22.2} = 178.9$
- 22. (a) $KBr = K^+ + Br^- = 2$ ions $BaCl_2 = Ba^{2+} + 2Cl^- = 3 \text{ inos}$ $Al_2(SO_4)_3 = 2Al^{3+} + 3SO_4^{2-} = 5 \text{ ions}$

.. urea is not ionise hence it is shows highest freezing point.

- 23. (d) $NaCl \rightarrow Na^+ + Cl^- = 2$ ions $K_2SO_4 \rightarrow 2K^+ + SO_4^{2-} = 3$ ions K_2SO_4 give maximum ion in solution so it shows maximum depression in freezing point.
- **24.** (c) $\Delta T_f = \frac{K_f \times 1000 \times w}{m \times W} = -0.216^{\circ} C$
- **25.** (a) $\Delta T_f = \frac{1000 \times 1.86 \times 17}{46 \times 1000} = 0.69^{\circ} C$ $T_f = 0 - 0.69 = -0.69^{\circ} C$
- **26.** (ad) The depression of freezing point is less than that of pure solvent and only solvent molecules solidify at the freezing point.
- **27.** (b) $K_f = \frac{RT_f^2}{1000 \times L_f}$, $R = 8.314 J K^{-1} mol^{-1}$ $T_f = 273 + 16.6 = 289.6 K \; ; \; L_f = 180.75 \; J g^{-1}$ $K_f = \frac{8.314 \times 289.6 \times 289.6}{1000 \times 180.75}$

Colligative properties of electrolyte

- 1. (c) $(NH_4)_3 PO_4$ gives maximum ion. Hence, its osmotic pressure is maximum.
- 2. (b) $BaCl_2$ gives maximum ion hence it is shows lowest vapour pressure.
- 3. (d) Na_3PO_4 consist of maximum ions hence it show lowest vapour pressure.

$$Na_3PO_4 \rightarrow 3Na^+ + PO_4^{3-} = 4$$
 ion.

- 4. (c) Vapour pressure of a solvent is lowered by the presence of solute in it. Lowering in vapour pressure is a colligative property i.e., it depends on the no. of particles present in the solution. Cu(NO₃)₂ give the maximum no. of ions. (i.e., 3) so it causes the greatest lowering in vapour pressure of water.
- **5.** (c) Na_2SO_4 have more osmotic pressure than NaCl solution because Na_2SO_4 gives 3 ions.

- **6.** (a) NaCl gives maximum ion hence it will show highest osmotic pressure.
- 8. (c) $BaCl_2 \Rightarrow Ba^{2+} + 2Cl^- = 3$ ion $NaCl \Rightarrow Na^+ + Cl^- = 2$ ion Glucose \Rightarrow No ionisation $\therefore BaCl_2 > NaCl > Glucose$
- 9. (a) $Al_2(SO_4)_3$ gives maximum osmotic pressure because it is
- 10. (a) Highest osmotic pressure is given by solution which produce maximum number of ions i.e. $CaCl_2$.
- 11. (c) $BaCl_2$ gives maximum ion. Hence, its shows highest boiling point.
- 12. (c) $BaCl_2$ gives maximum ion. Hence, its boiling point is maximum.
- 13. (d) $CaCl_2$ gives maximum ion hence it shows highest boiling point.
- 14. (c) Elevation in boiling point is a colligative property which depends upon the number of solute particles. Greater the number of solute particle in a solution higher the extent of elevation in boiling point.

$$Na_2SO_4 \rightarrow 2Na^+ + SO_4^{2-}$$

- **15.** (a) NaCl contain highest boiling point than other's compound.
- 16. (d) $KCl > C_6H_5OH > C_6H_{12}O_6$ Boiling point decreasing order \rightarrow

Potassium chloride is ionic compound and phenol is formed phenoxide ion hence it is shows greater boiling point then glucose.

- 17. (c) $Al_2(SO_4)_3$ gives maximum ion hence it will show highest boiling point.
- **18.** (b) $\it NaCl$ is a more ionic compare to $\it BaCl_2$, glucose and urea solution
- 19. (c) Urea = 1; Common salt = 1; $Na_2SO_4 = 3$ Ratio = 1: 2: 3
- **20.** (c) $CaCl_2$ gives maximum ion hence it has minimum freezing point.
- 21. (b) NaCl gives maximum ion hence it shows lowest freezing point
- **23.** (b) Lesser the number of particles in solution. Lesser the depression in freezing point, *i.e.* higher the freezing point.
- **24.** (c) *BaCl*₂ gives maximum ion hence it shows maximum depression in freezing point.
- **26.** (d) We know that lowering of freezing point is a colligative property which is directly proportional to the number of particles formed by one mole of compound therefore 0.1M $Al_2(SO_4)_3$ solution will have minimum freezing point.
- **27.** (a) $Al_2(SO_4)_3$ gives maximum ion hence its gives lowest freezing point.
- 28. (b) Colligative property in decreasing order $Na_3PO_4 > Na_2SO_4 > NaCl$ $Na_3PO_4 \rightarrow 3Na^+ + PO_4^{3-} = 4$ $Na_2SO_4 \rightarrow 2Na^+ + SO_4^{2-} = 3$

$$NaCl \rightarrow Na^+ + Cl^- = 2$$

29. (d) $K_4[Fe(CN)_6]$ gives maximum ion. Hence it have lowest vapour pressure.

Abnormal Molecular Mass

- 1. (c) Na_3PO_4 gives maximum four ion it is show highest Vant's haff factor
- 2. (a) $K_4[Fe(CN)_6]$ dissociates as $4K^+ + [Fe(CN)_6]^{4-}$, thus 1 molecule dissociates into five particles in the similar way $Al_2(SO_4)_3$ also gives five particles per molecule.
- **3.** (a) Benzoic acid in benzene undergoes association through intermolecular hydrogen bonding.
- 4. (c) vont's Hoff factor (i) = $\frac{\text{experiment al C.P.}}{\text{Calculated C.P.}}$ = $1 - \alpha + x\alpha + y\alpha$, for KCl it is = 2 and for sugar it is equal to 1.
- 5. (c) $Ca(NO_3)_2 \rightarrow Ca^{2+} + 2NO_3^-$ it gives three ions hence the Van't Hoff factor = 3.
- **6.** (a) $m = \frac{5 \times 18 \times 2.5}{0.04 \times 80} = 70.31$
- 8. (c) $Na_2SO_4 \Rightarrow 2Na^+ + SO_4^{2-}$ Mol. before diss. 1 0 0

 Mol. after diss $1-\alpha$ 2α 1α $i = \frac{\text{Exp.C.P.}}{\text{Normal C.P.}} = 1-\alpha+2\alpha+\alpha=1+2\alpha$
- 10. (d) $MgSO_4$ dissociates to give 2 ions.
- 11. (d) Urea does not give ion in the solution.
- 13. (b) Molecular weight of $CH_3COOH=60$ Hence the molecular weight of acetic acid in benzene $=2\times60=120$.
- 17. (b) $AlCl_3$ furnishes more ions than $CaCl_2$ and thus shows higher boiling point *i.e.* $t_1 > t_2$.
- **18.** (d) $Na_3PO_4 = 3Na^+ + PO_3^{3-}$.
- 19. (b) Benzoic acid dimerises due to strong hydrogen bonding.

Critical Thinking Questions

- 1. (a) $\frac{P^o P_s}{P^o} = \frac{n}{n+N}$; $P^o = 0.80$, $P_s = 0.60$ $\therefore \frac{n}{n+N} = \frac{0.2}{0.8} = 0.25$.
- **2.** (c) We have

$$\frac{p^0 - 21.85}{21.85} = \frac{30 \times 18}{90 \times m} \text{, for 1 case} \qquad \dots (i)$$

wt. of solvent = 90 + 18 = 108 gm

$$\frac{p^0 - 22.15}{22.15} = \frac{30 \times 18}{108 \times m}, \text{ for II case} \qquad(ii)$$

By eq. (1) $p_m^0 - 21.85m = 21.85 \times 6 = 131.1$

By eq. (2) $p_m^0 - 22.15m = 22.15 \times 5 = 110.75$

0.30m = 20.35

$$m = \frac{20.35}{0.30} = 67.83$$

3. (c)
$$\frac{P^o - P_s}{P^o} = \frac{\frac{W_2}{M_2}}{\frac{W_1}{M_1}} = \frac{3000 - 2985}{3000} = \frac{\frac{5}{M_2}}{\frac{100}{18}} \text{ or } M_2 = 180$$

4. (d) It is known that azeotropic mixture of HCl and water 20.2% HCl

5. (a)
$$\pi = CRT = \frac{n}{V}RT = \frac{\frac{1.75}{342}}{\frac{150}{1000}} \times 0.0821 \times 290$$

= 0.8095 \approx 0.81 atm.

6. (c) Vant hoff factor of *NaCl* about 1.95 because it will be ionise into two ions.

$$NaCl \Rightarrow Na^+ + Cl^-$$

7. (b)
$$m = \frac{wRT}{PV} = \frac{0.6 \times 0.082 \times 300}{1.23 \times 0.1} = 120$$

8. (b)
$$m = \frac{K_b \times w \times 1000}{\Delta T_b \times W} = 143.18$$

9. (c) Here:
$$\Delta T_b = 0.323 K$$

$$w = 0.5143 g \text{ weight of Anthracene.}$$

W = 35 g weight of chloroform $K_b = \text{Molal elevation constant} (3.9 \text{ } K - \text{Kg} / \text{mol})$

$$m = \frac{K_b \times w \times 1000}{W \times \Delta T_b} = \frac{3.9 \times 0.5143 \times 1000}{0.323 \times 35}$$
$$= 177.42g/mol$$

10. (c) First boiling point of water = 100^{o} *C*Final boiling point of water = 100.52^{o} w = 3g, W = 200g, $K_b = 0.6 kg^{-1}$ $\Delta T_b = 100.52 - 100 = 0.52^{o}$ $m = \frac{K_b \times w \times 1000}{\Delta T_b \times W}$

$$= \frac{0.6 \times 3 \times 1000}{0.52 \times 200} = \frac{1800}{104} = 17.3 \, gmol^{-1} \,.$$

11. (b) Applying clausius clapeytron equation

$$\log \frac{P_2}{P_1} = \frac{\Delta H_V}{2.303R} \left[\frac{T_2 - T_1}{T_1 \times T_2} \right]$$
$$\log \frac{760}{23} = \frac{40656}{2.303 \times 8.314} \left[\frac{373 - T_1}{373T} \right]$$

This gives $T_1 = 294.4 K$.

12. (b) $\Delta T_f = \text{molality} \times K_f \times (1+\alpha)$ $\alpha=0.2$, Molality = 0.2, $K_f=1.86$ $\Delta T_f=0.2\times1.2\times1.86=0.4464^o$

Freezing point = $-0.45^{\circ} C$.

- 13. (b) $\Delta T_f = imk_f$; $0.0054 = i \times 1.8 \times 0.001$ i = 3 so it is $[Pt(NH_3)_4 Cl]Cl_2$.
- 14. (d) $m = \frac{K_f \times w \times 1000}{\Delta T_f \times W} = 60 \text{ g/mole}$.
- **15.** (a) $\Delta T = K_f \times \text{Molality} = 4.9 \times 0.001 = 0.0049 K$
- 16. (c) $Na_2CO_3 + H_2SO_4 \rightarrow Na_2SO_4 + CO_2HO_1$ $98 \text{ gm}(2\text{mole}) \rightarrow 1\text{ mole}$ 1 mole $0.02 = \frac{0.02 \times 22.4}{2} = 0.224$.

17. (a) We know that in the first solution number of the moles of urea

$$= \frac{\text{Mass of urea}}{\text{m.wt. of urea}} \times \frac{1}{V} = \frac{12}{60} \times \frac{1}{1} = 0.2 \text{ and}$$

In second solution the number of moles of cane sugar

$$= \frac{\text{Mass of cane sugar}}{m.wt. \text{ of cane sugar}} = \frac{68.4}{342} \times \frac{1}{1} = 0.2.$$

Assertion & Reason

1. (a) Molecular weight of urea (NH_2CONH_2)

$$=14+2+12+16+14+2=60$$

Number of moles
$$=\frac{\text{Weight}}{\text{molecular weight}} = \frac{60}{60} = 1$$

2. (e) If $100 \ cc$ of $0.1 \ N \ HCl$ is mixed with $100 \ cc$ of $0.2 \ N \ HCl$, the normality of the final solution will be 0.15.

$$N_1V_1 + N_2V_2 = N_3V_3$$
 i.e., $0.1 \times 100 + 0.2 \times 100$

$$=N_3 \times 200$$
 or $N_3 = \frac{0.3 \times 100}{200} = 0.15$

- **3.** (c) Both the solute and solvent will form the vapour but vapour phase will become richer in the more volatile component.
- 4. (b) Non-ideal solutions with positive deviation i.e., having more vapour pressure than expected, boil at lower temperature while those with negative deviation boil at higher temperature than those of the components.
- **5.** (c) The polymer solutions possess very little elevation in boiling point or depression in freezing point.
- **6.** (a) Depression in freezing point is a colligative property which depends upon the number of particles. The number of particles are different in case of benzene and water that is why molecular weight of acetic acid determined by depression in freezing point method is also different.
- 7. (d) Sodium ion, Na^+ and potassium ion, K^+ are responsible for maintaining proper osmotic pressure balance inside and outside of the cells of organisms.
- **8.** (a) If a pressure larger than the osmotic pressure is applied to the solution side, the pure solvent flows out of the solution through semi-permeable membrane and this phenomenon is called as reverse osmosis.
- **9.** (c) Camphor has high molal depression constant.
- 10. (b) Elevation in boiling point and depression in freezing point are colligative properties because both depend only on the number of particles (ions or molecules) of the solute in a definite amount of the solvent but not on the nature of the solute.
- **12.** (a) The boiling point and melting point are higher due to presence of the intermolecular hydrogen bonding.
- 14. (d) If a non-volatile solute is added to water its vapour pressure always decreases. Therefore, both assertion and reason are false.
- 15. (b) We know that heat of vaporisation of water at $100^{\circ}\,C$ is $40.6\,kJ$ and that of benzene is 31kJ at $80^{\circ}\,C$. The amount of heat required to vaporise one mole of liquid at constant temperature is known as heat of vapourisation therefore, both assertion and reason are true but reason is nat the correct explanation of assertion.
- **16.** (d) See melts slowly at high altitude because melting is favoured at a high pressure at high altitude the atmospheric pressure is low and so ice melts slowly.
- 17. (a) Colligative properties are the properties of solutions containing non volatile solute. It is correct that malecular mass of benzoic acid when determined by colligative properties is found

- abnormally high. This is because dimerisation of benzoic takes place in solution resulting high molecular mass. Therefore, assertion and reason are true and reason is correct explanation.
- 18. (a) It is fact that use of pressure cooker reduces cooking time because at higher pressure over the liquid due to cooker lid, the liquid boils at higher temperature and cooking occurs faster.
- 19. (c) The assertion that $CCl_4 \& H_2O$ are immiscible is true because CCl_4 is non-polar liquid while water is polar hence assertion is true and reason is false.
- **20.** (b) It is true that isotonic solution doesn't show the phenomenon of osmosis. Isotonic solution are those solution which have same osmotic pressure. Here both assertion and reason are true but reason is not correct explanation.

Solution and Colligative properties

ET Self Evaluation Test -4

- The 2N aqueous solution of H_2SO_4 contains
 - (a) 49 gm of H_2SO_4 per litre of solution
 - (b) 4.9 gm of H_2SO_4 per litre of solution
 - (c) 98 gm of H_2SO_4 per litre of solution
 - (d) 9.8 gm of H_2SO_4 per litre of solution
- The amount of KMnO_4 required to prepare 100 ml of 0.1N2. solution in alkaline medium is [CPMT 1986]
 - (a) 1.58 gm
- (b) 3.16 gm
- (c) 0.52 gm
- (d) 0.31 gm
- What weight of hydrated oxalic acid should be added for complete 3. neutralisation of 100ml of 0.2N-NaOH solution?
 - (a) 0.45 g
- (b) 0.90 g
- (c) 1.08 g
- (d) 1.26 g
- A 500g tooth paste sample has 0.2g fluoride concentration. What is the concentration of F in terms of ppm level
 - (a) 250
- (b) 200
- 400 (c)
- (d) 1000
- To 5.85gm of NaCl one kg of water is added to prepare of solution. What is the strength of NaCl in this solution (mol. wt. of NaCl = 58.5) [CPMT 1990; DPMT 1987]
 - (a) 0.1 Normal
- (b) 0.1 Molal
- 0.1 Molar
- (d) 0.1 Formal
- The degree of dissociation of $Ca(NO_3)_2$ in a dilute aqueous 6. solution containing 14g of the salt per 200g of water $100^{\circ}C$ is 70 percent. If the vapour pressure of water at 100° C is 760 cm. Calculate the vapour pressure of the solution

[UPSEAT 2000]

- (a) 746.3 mm of Hg
- (b) 757.5 mm of Hg
- (c) 740.9 mm of Hg
- (d) 750 mm of Hg
- 7. The vapour pressure of pure benzene at a certain temperature is 200 mm Hg. At the same temperature the vapour pressure of a solution containing 2g of non-volatile non-electrolyte solid in 78g of benzene is 195 mm Hg. What is the molecular weight of solid
 - (a) 50

- (d) 80
- Which one of the following non-ideal solutions shows the negative
- $CH_3COCH_3 + CS_2$ (b) $C_6H_6 + CH_3COCH_3$

 - (c) $CCl_4 + CHCl_3$ (d) $CH_3COCH_3 + CHCl_3$

- The O.P. of equimolar solution of Urea, $BaCl_2$ and $AlCl_3$, will be in the order [DCE 2000]
 - (a) $AlCl_3 > BaCl_2 > Urea$
 - (b) $BaCl_2 > AlCl_3 > Urea$
 - (c) Urea > $BaCl_2$ > $AlCl_3$
 - $BaCl_2 > Urea > AlCl_3$
- The osmotic pressure of a 5% solution of cane sugar at $150^{\circ} C$ is 10. (mol. wt. of cane sugar = 342)

[CPMT 1986; Manipal MEE 1995]

- (a) 4 atm
- (b) 3.4 atm
- [MP PMT 1997] 5.07 atm
- (d) 2.45 atm
- Which one of the following pairs of solutions can we expect to be isotonic at the same temperature [NCERT 1982]
 - 0.1M urea and 0.1M NaCl
 - Orland O.2M MgCl2
 - 0.1M NaCl and 0.1M Na₂SO₄
 - $0.1M Ca(NO_2)_2$ and $0.1M Na_2SO_4$
- Which of the following would have the highest osmotic pressure 12. (assume that all salts are 90% dissociated)

[NCERT 1982]

- (a) Decimolar aluminium sulphate
- (b) Decimolar barium chloride
- (c) Decimolar sodium sulphate
- (d) A solution obtained by mixing equal of (b) and (c) and filtering
- Which solution will have the highest boiling point

[NCERT 1981]

- (a) 1% solution of glucose in water
- (b) 1% solution of sodium chloride in water
- (c) 1% solution of zinc sulphate in water
- (d) 1% solution of urea in water
- The boiling point of a solution of 0.11 gm of a substance in 15 gm of 14. ether was found to be $0.1^{\circ}C$ higher than that of the pure ether. The molecular weight of the substance will be $(K_b = 2.16)$ [MP PET 2002]
 - (a) 148
- (b) 158
- (c) 168
- (d) 178
- The boiling point of benzene is 353.23 K. When 1.80 gm of a nonvolatile solute was dissolved in 90 gm of benzene, the boiling point is raised to 354.11 K. the molar mass of the solute is

 $[K_b \text{ for benzene} = 2.53 \text{ K mol} \cdot]$

[DPMT 2004]

- (a) $5.8 \ g \ mol^{-1}$
- (b) $0.58 \ g \ mol^{-1}$
- (c) $58 \ g \ mol^{-1}$
- (d) $0.88 \ g \ mol^{-1}$
- **16.** The boiling point of 0.1 molal aqueous solution of urea is $100.18^{\circ}\,C$ at 1 atm. The molal elevation constant of water is
 - (a) 1.8

(b) 0.18

(c) 18

- (d) 18.6
- 17. The freezing point of a solution containing 4.8 g of a compound in 60 g of benzene is 4.48. What is the molar mass of the compound ($K_f = 5.1 \, km^{-1}$), (freezing point of benzene = 5.5 C)
 - (a) 100
- (b) 200
- (c) 300
- (d) 400

- 18. When 0.01 mole of sugar is dissolved in 100g of a solvent, the depression in freezing point is 0.40° . When 0.03 mole of glucose is dissolved in 50g of the same solvent, the depression in freezing point will be
 - (a) 0.60°
- (b) 0.80°
- (c) 1.60°
- (d) 2.40°
- 19. The freezing point of equimolal aqueous solution will be highest for
 - a) $C_6H_5NH_3^+Cl^-$ (aniline hydrochloride)
 - (b) $Ca(NO_3)_2$
 - (c) $La(NO_3)_3$
 - (d) $C_6H_{12}O_6$ (glucose)
- **20.** The Van't Hoff factor of the compound $K_3 Fe(CN)_6$ is
 - (a) 1 [AFMC 2000]
- (b) 2

(c) 3

(d) 4

Answers and Solutions

(SET -4)

1. (c) Wt. of
$$H_2SO_4$$
 per litre = $N \times eq$. mass = $2 \times 49 = 98g$.

2. (a) In alkaline medium $KMnO_4$ act as oxidant as follows.

$$2KMnO_4 + 2KOH \rightarrow 2K_2MnO_4 + H_2O + (O)$$

Hence its eq.wt. = m.wt. = 158

Now, Normality =
$$\frac{\text{Mass}}{\text{Eq. mass}} \times \frac{1}{V_{(I)}}$$

mass =
$$0.1 \times 158 \times \frac{100}{1000} g = 1.58 g$$
.

3. (d) For complete neutralization equivalent of oxalic acid = equivalent of *NaOH* =

$$\frac{w}{eg.wt} = \frac{NV}{1000}$$
 $\therefore \frac{w}{63} = \frac{0.2 \times 100}{1000} \Rightarrow w = 1.26 \text{ gm}.$

4. (c)
$$F^-$$
 ions in $PPm = \frac{0.2}{500} \times 10^6 = 400$

5. (b) 5.85 g *NaCl* = 0.1 mol as it present in 1 kg of

water; molality =
$$\frac{wt}{m wt. \times l} = \frac{5.85}{58.5 \times 1} = 0.1 \text{molal}$$

6. (a)

7. (d)
$$\frac{P^o - P_s}{P^o} = \frac{n}{n+N}$$
; $\frac{P^o - P_s}{P^o} = \frac{w \times M}{m \times W} = 80$

8. (d) $CH_3COCH_3 + CHCl_3$ is non ideal solution which shown negative deviation.

9. (a) The particle come of $AlCl_3$ solution will be maximum due to ionisation less in $BaCl_2$ and minimum in urea

$$AlCl_3 \rightarrow Al^{3+} + 3Cl^{-} = 4$$

$$BaCl_2 \to Ba^{2+} + 2Cl^{-} = 3$$

More the number of particles in solution more is the osmotic pressure a colligative properties.

10. (c)
$$\pi = \frac{5 \times 0.0821 \times 1000 \times 423}{342 \times 100} = 5.07 \text{ atm}$$
.

11. (d) Osmotic pressure is a coligative properties equimolar solution of $Ca(NO_3)_2$ and Na_2SO_4 will produce same number of solute particles.

$$CaNO_3 = Ca^{2+} + 2NO_3^-$$

$$Na_2(SO_A) = 2Na^+ + SO_A^{2-}$$

12. (a) $Al_2(SO_4)_3$ Deci-molar gives maximum ion. Hence, its osmotic pressure is maximum.

13. (b) NaCl and $ZnSO_4$ gives 2 ions but NaCl is more ionic than $ZnSO_4$.

$$\mathbf{14.} \qquad \text{(b)} \quad m = \frac{K_b \times w \times 1000}{\Delta T_b \times W}$$

$$K_b = 2.16$$
, $w = 0.11$, $W = 15g$, $\Delta T_b = 0.1$

$$m = \frac{2.16 \times 0.11 \times 1000}{0.1 \times 15} = 158.40 \approx 158.$$

15. (c) The elevation (ΔT_h) in the boiling point

$$=354.11K - 353.23K = 0.88K$$

Substituting these values in expression

$$M_{\text{Solute}} = \frac{K_b \times 1000 \times w}{\Delta T_b \times W}$$

Where, w = weight of solute, W = weight of solvent

$$M_{\text{solute}} = \frac{2.53 \times 1.8 \times 1000}{0.88 \times 90} = 58 \text{ gmmol}^{-1}$$

Hence, molar mass of the solute $= 58 \, gmmol^{-1}$

16. (a)
$$K_b = \frac{0.18}{0.1} = 1.8$$

17. (d)
$$m = \frac{K_f \times 1000 \times w}{W \times \Delta T_f} = \frac{5.1 \times 1000 \times 4.8}{60 \times 1.02} = 400$$
.

$$18. (d) \Delta T_f = mk_f$$

$$0.40 = \frac{0.01 \times 1000}{100} \times k_f \Longrightarrow k_f = 4$$

again
$$\Delta T_f = mk_f$$

$$=\frac{0.03\times1000}{50}\times4$$

= 2.4

19. (d) $La(NO_3)_3$ will furnish four ions and thus will develop more lowering in freezing point whereas glucose gives only one particle and thus minimum lowering in freezing point.

20. (d)
$$K_3[Fe(CN)_6] \rightarrow 3K^+ + [Fe(CN)_6]^{3-}$$
.
