8. (c) For following reaction, $2NO_{(g)} + O_2(g) \rightarrow 2NO_2(g)$

When the volume of vessel change into $\frac{1}{3}$ then concentration

of reactant become three times.

The rate of reaction for first order reaction $\, \infty \,$ concentration. So rate of reaction will increases three times.

9. (b) $2A + B \rightarrow \text{Products}$

According to question : Rate of reaction of 'A' \propto [B] as increase in rate is double when [B] is doubled.

Rate of reaction ∞ [A] [B] as increase in rate is 8 times when concentration of both reactant is doubled. It means that order of reaction is 3 and overall rate reaction should be $r = K[A]^2[B]$

10. (b) Let the rate of reaction depends on x power of [A]. Then

$$r_1 = k[A]^x$$
 and $r_2 = k[2A]^x$

$$\therefore \frac{r_1}{r_2} = \frac{[A]^x}{[2A]^x} = \frac{1}{4} = \left(\frac{1}{2}\right)^2 \qquad (\because r_2 = 4r_1)$$

 $\therefore x = 2$. As the reaction rate does not depend upon the concentration of B. Hence, the correct rate law will be rate $= K[A]^2[B]^o$ or $= K[A]^2$

- 11. (b) Velocity constant 'K' is characteristic constant of a reaction and depends only on temperature and catalyst.
- **12.** (d) Unit of K for 1 order reaction is $Time^{-1}$.
- 13. (a) $K = Ae^{-E_a/RT}$ by this equation it is clear that rate constant of a reaction depends on temperature

14. (c)

 - (c) is wrong because time taken for 75% reaction is two half life.
 - (d) is correct because in $k=Ae^{-E_a/RT}$, $E_{a/RT}$ is dimensionless hence A has the unit of K.
- **166.** (b) $aA \rightarrow xP$ Rate of reaction = [A]

Onder of reaction

Order of reaction = a

$$[A] = 2.2 \, mM, \, r = 2.4 \, m \, M \, s \, ...(i)$$

$$[A]_i = 2.2/2 \text{ } mM, r = 0.6 \text{ } m \text{ } M \text{ } s \text{ or}, \frac{2.4}{4}$$
 ...(ii

On reducing the concentration of \boldsymbol{A} to half, the rate of reaction is decreased by four times.

Rate of reaction = [A]

Order of reaction = 2.

- 167. (d) Order of a reaction can be fractional.
- **168.** (b) $t_{1/4} = \frac{2.303}{K} \log \frac{1}{1 \frac{1}{4}} = \frac{0.29}{K}$.
- **169.** (d) R = K[A]

$$2 \times 10^{-5} = K \times 10^{-2}$$

$$K = 2 \times 10^{-3} \text{ sec}^{-1}$$

$$t_{1/2} = \frac{.693}{K} = \frac{.693}{2 \times 10^{-3}} = \frac{693}{2} = 347 \text{ sec}$$

- **170.** (b) $R = k[B]^n$; $\frac{1}{4}R = k[2B]^n$; $4 = \left(\frac{1}{2}\right)^n$; $4 = 2^{-n}$; n = -2.
- 171. (c) $T = t_{1/2} \times n$ i.e. $12 = 3 \times n \Rightarrow n = 4$ $N = N_0 \left(\frac{1}{2}\right)^n \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^4 = \frac{1}{16}$
- 172. (c) $K = 1.7 \times 10^{-5} s^{-1}$ $t_{1/2} = \frac{0.693}{K} = \frac{0.693}{1.7} \times 10^{5} = 11.32h$
- 173. (c) $A + B \to C$

On doubling the concentration of A rate of reaction increases by four times. Rate $\propto [A]^2$

However on doubling the concentration of B , rate of reaction increases two times. Rate $\propto [B]$

- Thus, overall order of reaction = 2 + 1 = 3.
- 174. (a) In case of zero order reaction, the concentration of reactant decreases linearly with time, as its rate is independent of the concentration of the reactants.

- **2.** (c) $-\frac{1}{3}\frac{d[A]}{dt} = \frac{1}{2}\frac{d[B]}{dt}$ $\therefore \frac{d[B]}{dt} = -\frac{2}{3}\frac{d[A]}{dt}$

$$=K(A)^{n}(B)^{m} 2^{n-m}, \frac{R'}{R}=\frac{K(A)^{n}(B)^{m} 2^{n-m}}{K(A)^{n}(B)^{m}}=2^{n-m}$$

- 5. (c) $\ln K = \ln -\frac{E_a}{RT}$ is Arrhenius equation. Thus plots of $\ln K$ vs 1/T will give slope $= -E_a/RT$ or $-E_a/2.303R$.

$$\log \frac{K_2}{K_1} = \frac{E_a}{2.303R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$$

$$\log \frac{K_2}{3 \times 10^{-4}} = \frac{104.4 \times 10^3 \text{ J } mol^{-1}}{2.303 \times (8.314 \text{ J } k^{-1} mol^{-1})}$$

$$\left[\frac{1}{298K} - \frac{1}{T}\right] \text{As T} \to \infty, \frac{1}{T} \to 0$$

- (d) Combustion is an exothermic process, which is expected to be favoured by low temperature, but it is not true. Combustion include burning of particles which takes place at higher temperature. Thus at high temperature due to combustion of more particles, the reaction proceeds at higher rate.
- 14. (d) Rate constant $= 2.3 \times 10^{-2} \text{ sec}^{-1}$ It means it is a first order reaction (because unit of rate constant is sec.)

For first order reaction $K = \frac{1}{t} \ln \frac{a}{a - x}$

$$2 \times T_{1/2} = 40 \text{ min}$$

$$\therefore T_{1/2} = 20 min$$

Rate of reaction =

Assertion and Reason

- 1. (b) Instantaneous rate of a reaction is equal to small change in concentration (dx) during a small interval of time (dt) at that particular instent of time divided by the time interval.
- 2. (b) Molecularity of a reaction can be defined only for an elementary reaction because complex reaction does not take place in one single step and it is almost impossible for all the total molecules of the reactants to be in a state of encounter simultaneously.
- **3.** (b) For a zero order reaction, $t_{1/2} = [A_0]/2K$.
- **4.** (b) According to Arrhenius equation, $K=Ae^{-E_a/RT}$ when $E_a=0,\,K=A$.
- **6.** (a) For a first order reaction, $K=\frac{2.303}{t}\log\frac{a}{a-x}$, where a is initial concentration, and x is the amount reacted in time t. For half-life x=a/2, $t=t_{1/2}$

$$K = \frac{2.303}{K} \log \frac{a}{a - a/2}$$
$$t_{1/2} = \frac{2.303}{K} \log 2 = \frac{0.693}{K}.$$

- 7. (d) $H_2+Cl_2 \rightarrow 2HCl$ has much higher quantum efficiency than $H_2+Br_2 \rightarrow 2HBr$. The first step of secondary process of $H_2+Cl_2 \rightarrow 2HCl$ is exothermic while the same for $H_2+Br_2 \rightarrow 2HBr$ is endothermic.
- **8.** (e) Vision is a fast photochemical reaction in which the compound, retinal, present in the eye undergoes isomerisation by absorbing a photon of light.
- **9.** (a) The emission of cold light during a chemical reaction is called chemiluminescence.
- 10. (d) The rate reaction is never negative. Minus sign used in expressing the rate only shows that the concentration of the reactant is decreasing.
- 11. (a) Rate expression $\frac{dx}{dt} = K[A]^m [B]^n$

Shows that the total order of reactions is m+n+O=m+n as the rate of reaction is independent of concentration of C, *i.e.* the order with respect to C is zero. This is the reason that C does not figure in the rate expression.
