## HINTS & SOLUTIONS

### DPP/CB07

1. (d) Squamous epithelium is formed of thin discoidal and polygonal cells that fit like tiles in a floor, so is also called pavement epithelium. It is found in the walls of blood vessels, in the alveoli of lungs for exchange of gas, and in Bowman's capsule of nephron for ultra filtration.
2. (b) The cell junctions called tight, adhering and gap junctions are found in epithelial tissue. Epithelial tissue covers the whole surface of the body. It is made up of cells closely packed and arranged in one or more layers.
3. (b) 4. (d)
5. (d) Myoglobin is a single-chain globular protein of 153 amino acids, containing a heme (iron-containing porphyrin) prosthetic group in the center around which the remaining apoprotein folds. It has a molecular weight of 16,700 daltons, and is the primary oxygen-carrying pigment of muscle tissues. Unlike the blood-borne hemoglobin, to which it is structurally related, this protein does not exhibit cooperative binding of oxygen, since positive cooperativity is a property of multimeric/oligomeric proteins only.
6. (a)
7. (c) Silver fish (Insecta), scorpion (Arachnida); crab (Crustacea) and honey bee (Insecta) all belong to phylum Arthropoda which is characterized by the presence of jointed appendages. Poison glands occur only in scorpion. Compound eyes and metamorphosis are the characteristic of insects.

8. (c)
9. (a) Lymph differs from blood in that it contains less protein and no red blood cells. Lymph contains white blood cells.
10. (b)
11. (c) Dolphin is an aquatic mammal and breathes through lungs.
12. (c)    13. (b)    14. (a)    15. (a)    16. (c)

18. (a) Presence of air passages in the bones (pneumatic bones) is a characteristic of birds.
19. (a)    20. (c)
21. (b) Nephridia in earthworm, malpighian tubules in cockroach and urinary tubules in the rat are excretory in function.

39. (c) This cartilage is found in intervertebral discs.
40. (d) These granules are composed of RNA and protein.
41. (b) The GI tract is lined with simple columnar epithelium, which allows a maximum number of cells to contact food particles.
42. (a) Most epithelia have a basement membrane between the epithelial cells and the underlying connective tissue.
