## AR Assertion & Reason

*For AIIMS Aspirants*

Read the assertion and reason carefully to mark the correct option out of the options given below :

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

**1.** Assertion : The equilibrium constant is fixed and is the characteristic of any given chemical reaction at a specified temperature.

Reason : The composition of the final equilibrium mixture at a particular temperature depends upon the starting amount of reactants. **[AIIMS 2000]**

**2.** Assertion : $K_p = K_c$ for all reaction.

Reason : At constant temperature, the pressure of the gas is proportional to its concentration.

**3.** Assertion : The equilibrium constant for the reaction

$$CaSO_4.5H_2O(s) \rightleftharpoons CaSO_4.3H_2O(s) + 2H_2O(g)$$

is $K_C = \frac{[CaSO_4.3H_2O][H_2O]^2}{[CaSO_4.5H_2O]}$

Reason : Equilibrium constant is the ratio of the product of molar concentration of the substances produced to the product of the molar concentrations of reactants with each concentrations term raised to the power equal to the respective stoichiometric constant.

**4.** Assertion : On cooling a freezing mixture, colour of the mixture turns to pink from deep blue for a reaction. $Co(H_2O)_6^{2+}{}_{(aq)} + 4Cl^-{}_{(aq)} \rightleftharpoons CoCl_4^{2-}{}_{(aq)} + 6H_2O_{(l)}$.

Reason : Reaction is endothermic so on cooling, the reaction moves to backward direction.

**5.** Assertion : If $Q_c$ (reaction quotient) $< K_C$ (equilibrium constant) reaction moves in direction of reactants.

Reason : Reaction quotient is defined in the same way as equilibrium constant at any stage of he reaction.

**6.** Assertion : $NaCl$ solution can be purified by passage of hydrogen chloride through brine.

Reason : This type of purification is based on Le-Chaterlier's principle.

**7.** Assertion : According to Le-Chatelier's principle addition of heat to an equilibrium solid $\rightleftharpoons$ liquid results in decrease in the amount of solid.

Reason : Reaction is endothermic, so on heating forward reaction is favoured.

**8.** Assertion : Equilibrium constant has meaning only when the corresponding balanced chemical equation is given.

Reason : Its value changes for the new equation obtained by multiplying or dividing the original equation by a number.

**9.** Assertion : Equilibrium constant for the reverse reaction is the inverse of the equilibrium constant for the reaction in the forward direction.

Reason : Equilibrium constant depends upon the way in which the reaction is written.

**10.** Assertion : The value of $K$ gives us a relative idea about the extent to which a reaction proceeds.

Reason : The value of $K$ is independent of the stochiometry of reactants and products at the point of equilibrium.

**11.** Assertion : Catalyst affects the final state of the equilibrium.

Reason : It enables the system to attain a new equilibrium state by complexing with the reagents.

**12.** Assertion : For the reaction, $2NH_3(g) \rightleftharpoons N_2(g) + 3H_2(g)$, the unit of $K_p$ will be atm.

Reason : Unit of $K_p$ is $(atm)^{\Delta n}$.

**13.** Assertion : Effect of temperature of $K_c$ or $K_p$ depends on enthalpy change.

Reason : Increase in temperature shifts the equilibrium in exothermic direction and decrease in temperature shifts the equilibrium position in endothermic direction.

**14.** Assertion : For a gaseous reaction, $xA + yB \rightleftharpoons lC + mD, K_p = K_C$.

Reason : Concentration of gaseous reactant is taken to be unity.

**15.** Assertion : Ice $\rightleftharpoons$water, if pressure is applied water will evaporate.

Reason : Increase of pressure pushes the equilibrium towards the side in which number of gaseous mole decreases.

**16.** Assertion : $SO_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons SO_3(g) +$ heat.

Forward reaction is favoured at high temperature and low pressure.

Reason : Reaction is exothermic.

**17.** Assertion : For a reaction $H_2(g) + I_2(g) \rightleftharpoons 2HI(g)$ if the volume of vessel is reduced to half of its original volume, equilibrium constant will be doubled.

Reason : According to Le-Chatelier principle, reaction shifts in a direction that tends to undo the effect of the stress.

According to eq. (i) 2 mole of ammonia are present & to produce 2 mole of $NH_3$, we need 1 mole of $N_2$ and 3 mole of $H_2$ hence $2-1=1$ mole of $N_2$ and $4-3=1$ mole of $H_2$ are present at equilibrium in vessel.

**61.** (d) $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$

For $1dm^3$ $\quad R = k[SO_2]^2[O_2]$

$$R = K\left[\frac{1}{T}\right]^2\left[\frac{1}{1}\right] = 1$$

$\rightleftharpoons$

$$NO_2 \rightleftharpoons \frac{1}{2}N_2(g)+\frac{1}{2}O_2(g)$$

$$K_c' = \frac{[N_2]^{1/2}[O_2]^{1/2}}{[NO]} = \frac{1}{\sqrt{Kc}} = \frac{1}{\sqrt{4\times10^{-4}}}$$

$$= \frac{1}{2\times10^{-2}} = \frac{100}{2} = 50$$

$$K_c = \frac{[HI]^2}{[H_2][I_2]} = \frac{\left[\frac{0.5}{2}\right]^2}{\left[\frac{0.15}{2}\right]\left[\frac{0.15}{2}\right]} = \frac{0.5\times0.5}{0.15\times0.15} = 11.11$$

**67.** (d) $NH_2COONH_4 \rightleftharpoons 2NH_3+CO_2$

$\alpha = \frac{D-d}{(n-1)d}$ where $D$ is the density (initial)

$$D = \frac{mol.wt}{2} = \frac{78}{2} = 39$$

$n =$ no. of product = 3 $d =$ final density

$\alpha = \frac{39-13}{(3-1)13} = 1$, so $\alpha = 1$

**68.** (a) $\underset{(a-x)}{\overset{a}{N_2}} + \underset{(b-3x)}{\overset{b}{3H_2}} \rightleftharpoons \underset{(2x)}{\overset{0}{2NH_3}}$

50% Dissociation of $N_2$ take place so,

At equilibrium $\frac{2\times50}{100} = 1$; value of $x = 1$

$K_c = \frac{[2]^2}{[1][3]^3} = \frac{4}{27}$ so, $K_c = \frac{4}{27}$

**69.** (c) The equilibrium constant does not change when concentration of reactant is changed as the concentration of product also get changed accordingly.

**70.** (d) We know that $PV = nRT$

$P$ become $\frac{1}{2}P$ & $V$ bcome $2V$ so,

$$\frac{1}{2}P\times2V = PV = nRT$$

So there is no effect in equation.

$CaCO_{3(g)} \rightleftharpoons CaO_{(s)} + CO_{2(g)}$

$Kp = P_{CO_2}$ and $Kc = [CO_2]$

($\because$ $[CaCO_3] = 1$ and $[CaO] = 1$ for solids)

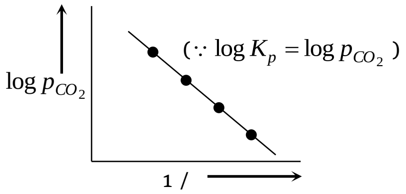
According to Arrhenius equation we have

$K = Ae^{-\Delta H^\circ_r/RT}$

Taking logarithm, we have

$$\log K_p = \log A - \frac{\Delta H_r^o}{RT(2.303)}$$

This is an equation of straight line. When log $K_p$ is plotted against 1 / $T$. we get a straight line.



The intercept of this line = log $A$, slope = $-\Delta H^\circ_r$ / 2.303 $R$

Knowing the value of slope from the plot and universal gas constant $R$, $\Delta H_r^o$ can be calculated.

(Equation of straight line : $Y = mx + C$. Here,

$$\log K_p = -\frac{\Delta H_r^o}{2.303\,R}\left(\frac{1}{T}\right) + \log A$$

$Y \quad m \quad x \quad C$

**10.** (b) $K_p = K_c(RT)^{\Delta n}$; When $\Delta n = 2-(2+1) = -1$, *i.e.* negative, $K_p < K_c$.

**11.** (c) $K_1 = \frac{[SO_3]}{[SO_2]\,[O_2]^{1/2}}$ and $K_2 = \frac{[SO_2]^2[O_2]}{[SO_3]^2}$; $K_2 = \frac{1}{K_1^2}$.

**13.** (c) Reaction is reversed. Hence

$$K = \frac{1}{(2.4\times10^{-3})} = 4.2\times10^{2}$$

**14.** (c) $K_p = \frac{[P_{co}]^2}{[P_{CO_2}]} = \frac{4\times4}{2} = 8$.

**15.** (d) $K_{c_1}$ for $H_2+I_2 \rightleftharpoons 2HI$ is 50

$K_{c_2}$ for $2HI \rightleftharpoons H_2+I_2$

$$K_{c_2} = \frac{1}{K_{c_1}} = \frac{1}{50} = 0.02$$

**16.** (c) $K_p = K_c(RT)^{\Delta n}$

$\Delta n = -1$ for reaction $2SO_2+O_2 \rightleftharpoons 2SO_3$

So for this reaction $K_p$ is less than $K_c$.

**17.** (c) $K_p = K_c(RT)^{\Delta n}$; $\Delta n = 2-2 = 0$

**18.** (c) For the reaction $H_2+I_2 \rightleftharpoons 2HI$

$\Delta n = 0$

So $K_p = K_c$ $\therefore$ 50.0

**19.** (d) For reaction $2SO_3 \rightleftharpoons O_2+2SO_2$

$\Delta n$ is + *ve* so $K_p$ is more than $K_c$.

By $K_p = K_c(RT)^{\Delta n}$

**20.** (c) $\Delta n$ =2-1=1

$K_p = K_c(RT)$

**21.** (c) For this reaction there is no change in equilibrium constant by change of volume.

**22.** (c) If $\Delta n$ =0 then $K_p = K_c$

**23.** (a) $k_p = k_c(RT)^{\Delta n}$

$\Delta n = 3-2 = 1$; $k_p > k_c$.

**24.** (d) Equilibrium constant depends upon temperature.

**25.** (d) $2NOCl_{(g)} = 2NO_{(g)} + Cl_{2(g)}$

$K_p = K_C\,(RT)^{\Delta n}$

$K_p = 3\times10^{-6}\,(0.0821\times700) = 172.41\times10^{-6}$

$= 1.72\times10^{-4}$

**27.** (b) $K' = K^n$; Hence $n = \frac{1}{2}$

$\therefore K' = K^{1/2} = \sqrt{K}$

**29.** (c) $2NO_2 \rightleftharpoons 2NO + O_2$ ......(i)

$K = 1.6\times10^{-12}$

Reaction (ii) is half of reaction (i)

$K = \frac{[NO]^2[O_2]}{[NO_2]^2}$ ......(i)

$K' = \frac{[NO_2]}{[NO]\,[O_2]^{1/2}}$ ......(ii)

On multiplying (i) and (ii)

$$K\times K' = \frac{[NO]^2[O_2]}{[NO_2]^2}\times\frac{[NO_2]}{[NO]\,[O_2]^{1/2}} = \frac{[NO]\,[O_2]^{1/2}}{[NO_2]} = \frac{1}{K'}$$

$K\times K' = \frac{1}{K'}$; $K = \frac{1}{K'^2}$; $K' = \frac{1}{\sqrt{K}}$.

**30.** (b) $K_p = K_c(RT)^{\Delta n}$; $\Delta n = 1$

So $K_c$ will be less than $K_p$.

**32.** (d) $K_1$ for $N_2+3H_2 \rightleftharpoons 2NH_3$

$K_2$ for $NH_3 \rightleftharpoons \frac{1}{2}N_2+\frac{3}{2}H_2$

$$K_1\times K_2 = \frac{[NH_3]^2}{[N_2]\,[H_2]^3}\times\frac{[N_2]^{1/2}[H_2]^{3/2}}{[NH_3]}$$

$K_1\times K_2 = \frac{1}{K_2}$; $K_2 = \frac{1}{\sqrt{K_1}}$

**34.** (a) $K_p = K_c(RT)^{\Delta n}$; $\Delta n = 2-4 = -2$

$K_p = 6\times10^{-2}\times(0.0812\times773)^{-2}$

$K_p = \frac{6\times10^{-2}}{(0.0812\times773)^2} = 1.5\times10^{-5}$.

**35.** (b) $2.303\log\frac{K_2}{K_1} = \frac{\Delta H}{R}\frac{[T_2-T_1]}{T_1\times T_2}$

**36.** (d) $\underset{4}{N_2+3H_2} \rightleftharpoons \underset{2}{2NH_3}$

$\Delta n$ = 2 – 4 = – 2

$K_p = K_c[RT]^{\Delta n}$; $K_p = K_c[RT]^{-2}$

$$K_c = \frac{K_p}{[RT]^{-2}} = \frac{1.44\times10^{-5}}{[0.082\times773]^{-2}}$$

**37.** (d) Catalyst does not affect equilibrium constant.

**38.** (d) $K$ for dissociation of $HI$ =?

$H_2+I_2 \rightleftharpoons 2HI$

$K_a = 50$ , $K_b = \frac{1}{50} = 0.02$

**39.** (b) $\underset{3}{2SO_2} + O_2 \rightleftharpoons \underset{2}{2SO_3}$ for this reaction

$\Delta n = -1$ ; $\therefore K_c > K_p$

**40.** (b) $CaCO_{3(s)} \rightleftharpoons CaO_{(s)} + CO_{2(g)}$

$K_p = P_{CO_2}$

Solid molecule does not have partial pressure so in calculation of $K_p$ only $P_{CO_2}$ is applicable.

**41.** (d) $NH_3 \rightleftharpoons \frac{1}{2}N_2 + \frac{3}{2}H_2$

$K_c = \frac{[N_2]^{1/2}[H_2]^{3/2}}{NH_3}$ and $\frac{1}{2}N_2 + \frac{3}{2}H_2 \rightleftharpoons NH_3$

$K_c = \frac{[NH_3]}{[N_2]^{1/2}[H_2]^{3/2}}$

So for dissociation $= \frac{1}{K_c}$

**42.** (b) Given $x = \frac{22}{100}$ and $a = 3.2$

$\therefore [HI]$ at equilibrium $= 3.2\left[1 - \frac{22}{100}\right] = 2.496$

**43.** (b) $K_c$ does not depend upon initial concentration of reactants or product.

**44.** (d) $K_p$ and $K_c$ are characteristic for a given reaction if $\Delta n = 0$ then there is no change.

**45.** (c) $K_{c_1} = \frac{[NO]^2[O_2]}{[NO_2]^2} = 1.8 \times 10^{-6} \Rightarrow K_{c_2} = \frac{[NO_2]}{[NO]\,[O_2]^{1/2}}$

$K_{c_1} = \frac{1}{K_{c_2}^2}$ ; $1.8 \times 10^{-6} = \frac{1}{K_{c_2}{}^2} \Rightarrow K_{c_2} = 7.5 \times 10^2$

**46.** (c) $K_1 = \frac{[H_2S]}{[H_2]\,[S_2]^{1/2}}$ ; $K_2 = \frac{[HBr]^2}{[H_2]\,[Br_2]}$

$K_3 = \frac{[HBr]^2 \times [S_2]^{1/2}}{[Br_2] \times [H_2S]}$ ; $\frac{K_2}{K_1} = K_3$

**47.** (b) $K_p = \frac{p^2}{4}; 0.11 = \frac{p^2}{4} \Rightarrow p^2 = 0.44$

**58.** (c) $\Delta H$ is positive so it will shift toward the product by increase in temperature.

**59.** (c) $CO(g) + Cl_2(g) \rightleftharpoons COCl_2(g)$

$\Delta n = 1 - 2 = -1$

$K_p = K_c[RT]^{\Delta n}$ ; $\therefore \frac{K_p}{K_c} = [RT]^{-1} = \frac{1}{RT}$

**60.** (c) $\Delta H$ is positive so reaction move forward by increase in temperature & value of $\Delta n = 3 - 2 = +1$ is positive so it forward with decrease in pressure.

**61.** (b) $2A(g) \qquad 3C(g) + D(s)$

For this reaction, $\Delta n_g = 3 - 2 = 1$

$\therefore K_p = K_c[RT]^1$ or $\frac{K_p}{K_c} = RT$ or $K_c = \frac{K_p}{RT}$

**62.** (a) According to Le-Chatelier principle exothermic reaction is forwarded by low temperature, in forward direction number of moles is less, hence pressure is high.

**63.** (d) In this reaction $\Delta H$ is negative so reaction move forward by decrease in temperature while value of $\Delta n = 2 - 3 = -1$ *i.e.*, negative so the reaction move forward by increase in pressure.

**64.** (a) $PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$

For this reaction $\Delta n = 2 - 1 = 1$

Value of $\Delta n$ is positive so the dissociation of $PCl_5$ take forward by decrease in pressure & by increase in pressure the dissociation of $PCl_5$ decrease.

**65.** (b) $N_2 + O_2 \rightleftharpoons 2NO$ .....(i)

For equation number (ii)

$$K_2 = \frac{[NO]}{[N_2]^{1/2}[O_2]^{1/2}} \qquad \text{...... (iv)}$$

$$K_C = \frac{[C]^4}{[A][B]^3} = \frac{4x.4x.4x.4x}{(a-x)(b-3x)}$$

Given $a = b, a - x = 4x \Rightarrow a = 5x = b$

$$K_C = \frac{4x.4x.4x.4x}{(5x-x)(5x-3x)} = \frac{4x.4x.4x.4x}{4x.2x.2x.2x} = 8 .$$

$K_p = 1$.

**5.** (d) $\Delta G^o = -2.303 \times 8.314 \times 10^{-3} \times 298 \; \log K_p$

$1.7 = -2.303 \times 8.314 \times 10^{-3} \times 298 \times \log K_p$

$K_p = 0.5$

**6.** (a) Equilibrium shifts backward by Le-chatelier's principle.

**7.** (c) Decreases the activation energy of both forward and backward reaction.

**8.** (d) Equilibrium constant changes with temperature, pressure and the concentration of either reactant or product.

**9.** (a) As we know that, $\Delta G^o = -2.303 \, RT \log K_p$

Therefore, $\Delta G^o = -2.303 \times (8.314) \times (298)$

$(\log 2.47 \times 10^{-29})$

$\Delta G^o = 16{,}3000 \; J\,mol^{-1} = 163 \; KJ\,mol^{-1}$

## Le-Chaterlier principle and It's application

**2.** (a) $N_2 + O_2 \rightleftharpoons 2NO$; $Q$ cal

The above reaction is endothermic so for higher production of $NO$, and the temperature should be high.

**4.** (c) At low pressure, reaction proceeds where volume is increasing. This is the favourable condition for the reaction. $PCl_5 \rightleftharpoons PCl_3 + Cl_2$ .

**6.** (c) Reaction is exothermic and volume is decreasing from left to right so for higher production of $SO_3$ there should be low temperature and high pressure.

**7.** (a) $\underset{\text{more volume}}{\text{Ice}} \rightleftharpoons \underset{\text{less volume}}{\text{Water}}$

On increasing pressure, equilibrium shifts forward.

**8.** (c) Exothermic reaction is favoured by low temperature to proceed in forward direction.

**9.** (a) Effect of catalyst is that it attains equilibrium quickly by providing a new reaction path of low activation energy. It does not alter the state of equilibrium.

**11.** (a) On increasing temperature equilibrium will shift in forward direction due to decrease in intermolecular forces of solid.

**12.** (c) Both $\Delta n$ and $\Delta H$ are negative. Hence, high pressure and low temperature will forward reaction.

**13.** (b) Exothermic reaction, favoured by low temperature.

**14.** (c) $\Delta n = 0$ , No effect of pressure.

**15.** (b) The reaction is endothermic in reverse direction and hence increase in temperature will favour reverse reaction.

**16.** (c) A reaction is in equilibrium it will shift in reverse or backward direction when we increase the concentration of one or more product (from Le chatelier's principle).

**17.** (a) According to Le chatelier's principle.

**18.** (c) The reaction takes place with a reduction in number of moles (volume) and is exothermic. So high pressure and low temperature with favour the reaction in forward direction

**19.** (b) At equilibrium, the addition of $(CN)^-$ would decrease the $(H^+)$ion concentration to produce more and more $HCN$ to nullified the increase of $CN^-_{aq}$.

**20.** (b) $H_2X_2 + \text{heat} \rightleftharpoons 2HX$.

Reaction is endothermic and volume increasing in forward direction so according to Le chatelier's principle for formation of $HX$, Temperature of the reaction should be high and pressure should be low.

**21.** (b) According to Le chatelier's principle.

**22.** (d) In reaction $CO + 3H_2 \rightleftharpoons CH_4 + H_2O$

**26.** (a) Being endothermic, the forward reaction is favoured by high temperature.

**27.** (c) According to Le chatelier's principle.

**28.** (b) On adding more $PCl_5$, equilibrium shifts forward.

**29.** (a) According to Le chatelier's principle.

**30.** (b) Increase in pressure causes the equilibrium to shift in that direction in which no. of moles (volume) is less.

**32.** (b,c) According to Le-chatelier's principle.

**37.** (d) By increasing the amount of $F_2$ in the reaction the amount of $ClF_3$ increases.

**39.** (b) According to Le chatelier's principle when we increase pressure reaction proceeds in that direction where volume is decreasing.

**40.** (a) Factors affecting equilibrium are pressure, temperature and concentration of product or reactant.

**42.** (b) According to Le chatelier's principle.

**43.** (d) Increase in volume, *i.e.*, decrease in pressure shifts the equilibrium in the direction in which number of moles increases ($\Delta n$ positive)

**46.** (d) At constant volume. Three is no change in concentration (closed container).

**47.** (c) $H_2O(g) \rightleftharpoons H_{2(g)} + \frac{1}{2}O_{2(g)}$

In this reaction volume is increasing in the forward reaction. So on increasing temperature reaction will proceed in forward direction.

**48.** (b) When temperature increases precipitation of sodium sulphate takes place. Because reaction is exothermic so reverse reaction will take place.

**49.** (a) For high yield of ammonia low temperature, high pressure and high concentration of the reactant molecule.

**53.** (c) Since $\Delta n = 0$.

**54.** (a) The rate of backward reaction favoured by increase of pressure in the reaction as $\Delta n$ is positive

$PCl_5 \rightleftharpoons PCl_3 + Cl_2$

**55.** (a) $H_{2(g)} \underset{2}{+} I_{2(g)} \rightleftharpoons \underset{2}{2HI}$

$\Delta n = 0$ ; $\because$ $K_c = K_p$

**56.** (c) Solid + liquid $\rightleftharpoons$ Solution $\Delta H$ =+ve

Increase in temperature favours forward reaction.

**57.** (a) Addition of an inert gas of constant volume condition to an equilibrium has no effect.

**58.** (b) Le chatelier principle is not applicable to solid-solid equilibrium.

**59.** (a) $A + \underset{2}{B} + Q \rightleftharpoons C \underset{2}{+} D$

The reaction is endothermic so on increase temperature concentration of product will increase.

**60.** (a) In that type of reaction the state of equilibrium is not effected by change in volume (hence pressure) of the reaction mixture.

**61.** (c) $N_2 + O_2 \rightleftharpoons 2NO$ ; $\Delta n = 0$

**65.** (c) High temperature and low pressure.

**66.** (d) High temperature and excess concentration of the reactant concentration.

**68.** (c) Low temperature and high pressure.

**69.** (a) $H_2 + I_2 \rightleftharpoons 2HI \Rightarrow \Delta n = 2 - 2 = 0$.

**70.** (d) Low temperature and low pressure.

**73.** (c) It is an exothermic reaction hence low temperature and increasing pressure will favour forward reaction

## Critical Thinking Questions

**1.** (b) $K_c = \frac{[PCl_3][Cl_2]}{[PCl_5]} = \frac{\left[\frac{20}{100}\right]\times\left[\frac{20}{100}\right]}{\left[\frac{80}{100}\right]}$

$= \frac{0.2\times 0.2}{0.8} = \frac{0.04}{0.8} = 0.05$

**2.** (b) $2NH_3 \rightleftharpoons N_2 + 3H_2$

Initial mole $a$ 0 0

Mole at equilibrium $(a-2x)$ $x$ $3x$

Initial pressure of $NH_3$ of a mole = 15 atm at $27^oC$

The pressure of 'a' mole of $NH_3 = p$ atm at $347^oC$

$\therefore \frac{15}{300} = \frac{p}{620}$

$\therefore p = 31$ atm

At constant volume and at $347^oC$, mole ∝ pressure

$a \propto 31$ (before equilibrium)

$\therefore a + 2x \propto 50$ (after equilibrium)

$\therefore \frac{a+2x}{a} = \frac{50}{31}$

$\therefore x = \frac{19}{62}a$

$\therefore$ % of $NH_3$ decomposed $= \frac{2x}{a}\times 100$

$= \frac{2\times 19a}{62\times a}\times 100 = 61.33\%$

**3.** (d) $K_p = K_c(RT)^{\Delta n}$ $R$ = Gas constant

**10.** (d) According to Le-chatelier's principle.

**11.** (d) $K_p$ (equilibrium constant) is independent of pressure and concentration.

## Assertion & Reason

**2.** (e) Assertion is false but reason is true.

$K_p \neq K_c$ for all reaction.

$K_p = K_c(RT)^{\Delta n}$

$\Delta n =$ number of moles of products – number of moles of reactants in the balanced chemical equation.

So, if for a reaction $\Delta n = 0$. Then $K_p = K_c$

**3.** (e) Assertion is false but reason is true.

$K_c = [H_2O]^2$, because concentration of solids is taken to be unity.

**4.** (a) Both assertion and reason are true and reason is the correct explanation of assertion.

$CO(H_2O)_6^{2+}$ (Pink) while $CoCl_4^{2-}$ (blue). So, on

Cooling because of Le-chatelier's principle the reaction tries to over come the effect of temperature.

**5.** (e) Assertion is false but reason is true.

$$aA + bB \rightleftharpoons cC + dD, \; Qc = \frac{[C]^c[D]^d}{[A]^a[B]^b}$$

If $Q_c > K_c$, reaction will proceed in the direction of reactants.

If $Q_c < K_c$, reaction will move in direction of products.

If $Q_c = K_c$, the reaction mixture is already at equilibrium.

**6.** (c) Assertion is true but reason is false. This is based on common ion effect.

$$NaCl \rightleftharpoons Na^+ + Cl^-; \quad HCl \rightleftharpoons H^+ + Cl^-$$

Concentration of $Cl^-$ ions increases due to ionisation of $HCl$ which increases the ionic product $[Na^+][Cl^-]$. This result in the precipitation of pure $NaCl$.

**7.** (b) Both assertion and reason are true and reason is not the correct explanation of assertion, solid+heat $\rightleftharpoons$ liquid, so on heating forward reactions is favoured and amount of solid will decrease.

**8.** (a) $aA + bB \rightleftharpoons cC + dD$

$$K_C = \frac{[C]^c[D]^d}{[A]^a[B]^b}$$

For $2aA + 2bB \rightleftharpoons 2cC + 2dD$

$$K_C = \frac{[C]^{2c}[D]^{2d}}{[A]^{2a}[B]^{2b}}.$$

**9.** (a) $H_{2(g)} + I_{2(g)} \rightleftharpoons 2HI_{(g)}$

$$K_C = \frac{[HI]^2}{[H_2][I_2]}$$

For reverse reaction $2HI_{(g)} \rightleftharpoons H_{2(g)} + I_{2(g)}$

$$K_C = \frac{[H_2][I_2]}{[HI]^2} = \frac{1}{K_C}.$$

**10.** (c) The value of $K$ depends on the stoichiometry of reactants and products at the point of equilibrium. For *e.g.,* if the reaction is multiplied by 2, the equilibrium constant is squared.

**11.** (d) Catalyst does not affect the final state of the equilibrium. It enables the system to attain equilibrium state earlier by providing an alternative path which involve lower energy of activation.

**12.** (e) $K_p = \dfrac{p_{H_2}^3 \times p_{N_2}}{p_{NH_3}} = \dfrac{(atm)^3(atm)}{(atm)^2} = (atm)^2$

or $\Delta n = 4 - 2 = 2$.

Unit of $K_p$ for given reaction $= (atm)^2$.

**13.** (c) According to Le-Chatelier's principle endothermic reaction favours increase in temperature. However exothermic reaction favours decrease in temperature.

**14.** (d) $K_p = K_c(RT)^{\Delta n}$; where $\Delta n = (l + m) - (x + y)$

Concentration of solids and liquids is taken to be unity.

**15.** (e) Increase in pressure favours melting of ice into water because at higher pressure melting point of ice is lowered.

**16.** (e) As assertion is exothermic, low temperature favours forward reaction. High pressure favours forward reaction as it is accompanied by decrease in the number of moles.

**17.** (e) There is no change in number of gas molecules. Therefore the expression for $K$ is independent of volume. Hence $K$ will remain same.
