MARKING SCHEME – ECONOMICS (Delhi)

(SET - 2)

Expected Answers / Value Points

GENERAL INSTRUCTIONS:

- 1. Please examine each part of a question carefully and allocate the marks allotted for the part as given in the marking scheme below. TOTAL MARKS FOR ANY ANSWER MAY BE PUT IN A CIRCLE ON THE LEFT SIDE WHERE THE ANSWER ENDS.
- 2. Expected suggested answers have been given in the Marking Scheme. To evaluate the answers the value points indicated in the marking scheme be followed.
- 3. For questions asking the candidate to explain or define, the detailed explanations and definitions have been indicated alongwith the value points.
- 4. For mere arithmetical errors, there should be minimal deduction. Only ½ mark be deducted for such an error.
- 5. Wherever only two / three or a "given" number of examples / factors / points are expected only the first two / three or expected number should be read. The rest are irrelevant and must not be examined.
- 6. There should be no effort at "moderation" of the marks by the evaluating teachers. The actual total marks obtained by the candidate may be of no concern to the evaluators.
- 7. Higher order thinking ability questions are assessing student's understanding / analytical ability.
- 8. 🏠 indicates value based questions.

General Note : In case of numerical question no mark is to be given if only the final answer is given.

	1	If in an oligopoly market firms produce homogeneous products, it is called perfect oligopoly.	1
	2	Returns to a factor refers to change in output when only one input is changed, other inputs remaining unchanged.	1
	3	Budget line is the locus of points, each point representing a bundle of the two goods which cost the consumer exactly his income.	1

5	Cost in economics refers to the sum of actual money expenditure on inputs and the estimated value of the free inputs supplied by the owner.	1
6	When MR < AR, AR falls When MR = AR, AR is constant When MR > AR, AR rises	3
	OR When TC rises at a decreasing rate, MC falls. When TC rises at an increasing rate MC rises. When TC rises at a constant rate MC is constant.	3
7	For whom to produce means that who will buy the goods and services produced. Clearly, those who have income will be able to buy. So, the problem amounts to how the national income is distributed in an economy.	3

9	When there are only a few firms in the market, it is likely that each firm has some knowledge as to how its rivals operate. Each firm expects reactions from the rival firms. Therefore, each firm in deciding price and output, takes into account the expected reactions by the rival firms. In this way the firms are interdependent on each other.	3
10	AFC falls continuously as output is increased. It is because, even when output is increased TFC remains unchanged. (Diagram not required)	1 2
11	There are three phases of change in MP :	
	(1) <u>MP rises</u> : Because when the variable input is increased, efficient utilization of the fixed inputs takes place due to specialisation. This raises efficiency of the variable input.	
	(2) <u>MP falls but is positive</u> : Because beyond a point increasing variable input puts pressure on fixed inputs leading to decline in efficiency.	
	(3) <u>MP continues to fall and is negative</u> : Because there is so much pressure of the variable input on the fixed inputs that total product starts declining.	4

reduce expenditure on A and increase that on B. So, when P_{B} falls, demand for B rises.	4
Related goods are either substitutes or complements. When the price of the	
substitute good rises (falls) it makes the given good relatively cheaper (expensive), so it is substituted for the other good (the other good is substituted for). As a result the demand for the given good will increase (decrease).	2
If price of a complementary good rises (falls), its demand falls (rises). As complementary goods are used jointly the demand for given good will fall (rise).	2
Price P_1 P_2	2
 OP₁ is the equilibrium price and OQ₁ is the equilibrium quantity. Demand decreases so that demand curve shifts to the left. The new demand curve is D₂ This creates an excess supply (A₁E₁) at the existing price OP₁. The excess supply creates competition among sellers, resulting in fall in price. Fall in price leads to rise in demand and fall in supply as indicated by the arrows. These changes continue till the market reaches new equilibrium at E₂ with a lower price OP₂ and lower quantity OQ₂. For the blind candidate : Decrease in demand results in excess supply. Excess supply causes competition among sellers which reduces price Fall in price results in rise in demand and fall in supply. 	4

	 The sum of demand of all goods and services is called aggregate demand. Equilibrium level of income is that level of income at which aggregate demand and supply are equal. When the economy is not in equilibrium then aggregate demand and supply are not equal. Suppose aggregate demand is greater than aggregate supply. 	2 3
	 This will reduce inventories. To make up this deflation producers will produce more. This will increase aggregate supply and ultimately it will become equal to aggregate demand. 	
	OR Relation between saving and income is saving function $C = \overline{C} + MPC$ (Y) S = Y - C	2
	$= Y - \overline{C} + MPC (Y)$ = $-\overline{C} + (1 - MPC)Y$ This is derivation of saving function from C function.	4
31	$NNP_{fc} = (ii + viii) + iv + vi + x - ix$	2
	= (600 + 100) + 200 + 300 + 300 - 50	1½
	= Rs 1450 arab	1/2
	Private income = $NNPfc - vii + I + v - iii$	1
	= 1450 - 400 + 60 + 70 - 20	1/2
	= Rs 1160 arab	1/2

32	(i) <u>Fees paid to mechanic by a firm</u> is not included because it is an intermediate cost of the firm.	2
	(ii) <u>Interest paid by an individual</u> is not included because the loan is taken to meet consumption expenditure and therefore interest paid on such a loan is not a factor payment.	2
	(iii) <u>Expenditure on purchasing car by a firm</u> is included because it is an investment expenditure, a final expenditure.	2
