HUMAN HEALTH AND DISEASES

- **Health** is a state of complete *physical, mental & social wellbeing.* It is affected by genetic disorders, infections, change in life style (food, water, rest, exercise, habits etc).
- Mind influences immune system (through neural and endocrine systems) and thereby health.
- When the functioning of organs or systems of the body is adversely affected, it is called a **disease**.
- Diseases may be **infectious** (transmits from one person to another) or **non-infectious** (do not transmit. E.g. cancer).

COMMON INFECTIOUS DISEASES IN MAN

1. BACTERIAL DISEASES

- a. Typhoid: Pathogen is Salmonella typhi.
 - **Mode of transmission:** It enters small intestine through food & water and migrates to other organs via blood.
 - **Symptoms:** Sustained high fever (39°-40° C), headache, weakness, stomach pain, constipation & loss of appetite. Intestinal perforation and death may occur.

Widal test is used for confirmation of the disease.

Mary Mallon **(Typhoid Mary)** was a professional cook. She was a typhoid carrier who spread typhoid for several years through the food she prepared.

b. Pneumonia: Pathogen is *Streptococcus pneumoniae* & *Haemophilus influenzae*.

It infects lung alveoli. The alveoli get filled with fluid leading to respiratory problems.

- Mode of transmission: Inhaling the droplets/aerosols released by an infected person. Sharing glasses and utensils with an infected person.
- **Symptoms:** Respiratory problems, fever, chills, cough, headache. In severe cases, lips and finger nails turn grey to bluish colour.

Other bacterial diseases: Dysentery, plague, diphtheria, etc.

2. VIRAL DISEASES

- a. Common cold: Pathogen is *Rhinoviruses*.
 - It infects nose & respiratory passage but not lungs.
 - Mode of transmission: Inhaling droplets resulting from cough or sneezes. Through contaminated objects (pens, books, cups, doorknobs, computer accessories) etc.
 - Symptoms: Nasal congestion & discharge, fever, headache, sore throat, cough, hoarseness, tiredness etc. Common cold lasts for 3-7 days.

3. PROTOZOAN DISEASES

a. Malaria: Pathogen is *Plasmodium sp.* (*P. vivax, P. malariae & P. falciparum*).
 Most serious (malignant) malaria is caused by *P. falciparum*.

- Mode of transmission: By female Anopheles mosquito.
- **Symptoms:** Haemozoin (toxin released by *Plasmodium*) causes chill and high fever recurring every 3-4 days.

• Disease causing organisms are called **Pathogens**. Parasites are pathogens as they harm the host.

Good humour hypothesis (by **Hippocrates** & **Indian Ayurveda system):** It states that health is a state of body & mind where there is a balance of certain humours. Persons with 'black bile' belong to hot personality and would have fevers.

William Harvey disproved this hypothesis. He discovered blood circulation and demonstrated normal body temperature in persons with black bile using thermometer.

Life cycle of Plasmodium

- b. Amoebiasis (Amoebic dysentery): Pathogen is Entamoeba histolytica.
 - Mode of transmission: Houseflies (mechanical carriers) transmit parasites from faeces to food & water.
 - **Symptoms:** Constipation, abdominal pain and cramps, stools with excess mucus and blood clots.

4. HELMINTH DISEASES

- a. Ascariasis: Pathogen is Ascaris (Intestinal parasite).
 - Mode of transmission: Soil, water, vegetables, fruits etc. contaminated with faeces containing eggs of parasites.
 - **Symptoms:** Internal bleeding, muscular pain, fever, anaemia and blockage of intestinal passage.
- b. Filariasis (Elephantiasis): Pathogen is Filarial worms or Wuchereria (W. bancrofti & W. malayi).
 - Mode of transmission: Bite of female *Culex* mosquito.
 - **Symptoms:** Filarial worms live in lymphatic vessels (usually of lower limbs). It causes chronic inflammation of the organs in which they live for many years. Limbs and genital organs may be deformed.

5. FUNGAL DISEASES

- a. Ring worms: Pathogens are Microsporum, Trichophyton
 & Epidermophyton. They are seen in groin, b/w toes etc.
 - Mode of transmission: From soil or by using towels, cloths, comb etc. Heat and moisture help fungi to grow.
 - **Symptoms:** Dry, scaly lesions on skin, nails, scalp etc. Intense itching.

PREVENTION AND CONTROL OF DISEASES

Personal hygiene

Keep the body clean. Use clean drinking water, food etc.

Public hygiene

- a. Proper disposal of wastes and excreta.
- b. Periodic cleaning and disinfection of water reservoirs, pools, cesspools and tanks.
- c. Avoid contact with infected persons or their belongings (to control air-borne diseases).

Thymus

- d. Standard practices of hygiene in public catering.
- e. Control and eliminate the vectors (e.g. mosquitoes).
 - Avoid stagnation of water.
 - Regular cleaning of household coolers.
- It is the system that gives immunity to the body by recognizing, responding and remembering foreign antigens.
- It plays role in allergic reaction, autoimmune disease and organ transplantation.
- It includes lymphoid organs, tissues, cells & antibodies.

LYMPHOID ORGANS

These are the organs where origin/maturation & proliferation of lymphocytes occur. 2 types: Primary & Secondary.

a. Primary lymphoid organs

The organs where lymphocytes are matured & differentiated to antigen-sensitive lymphocytes. It is 2 types:

- **1. Bone marrow:** The site of formation of all blood cells including B & T-lymphocytes.
- **2. Thymus:** A bilobed organ seen near the heart and beneath the breastbone. It is large during birth but gradually reduces in size and becomes very small size in puberty. Immature T-lymphocytes from bone marrow is migrated to thymus and matured.

b. Secondary lymphoid organs

- The organs, to which matured lymphocytes migrate from primary lymphoid organs, interact with antigens and then proliferate to become **effector cells.**

E.g. Spleen, lymph nodes, tonsils, Peyer's patches, Mucosaassociated lymphoid tissue (MALT) & appendix.

- **Spleen:** Bean-shaped organ. Contains lymphocytes and phagocytes. It removes worn-out RBCs & microorganisms from blood. It is a reservoir of erythrocytes in foetus.
- Lymph nodes: Found in lymphatic system. They trap microorganisms or other antigens. Trapped antigens activate lymphocytes and cause immune response.
- MALT: Located within the lining of respiratory, digestive & urinogenital tracts. It constitutes 50% of lymphoid tissue.

- Use of mosquito nets.
- Introduce larvivorous fishes like Gambusia in ponds.
- Spraying insecticides in ditches, drainage and swamps.
- Provide doors and windows with wire mesh.

These precautions can avoid vector-borne diseases like Malaria, Filariasis, Dengue & *Chikun gunya*.

Vaccines & immunisation helped to control diseases like smallpox, polio, diphtheria, pneumonia & tetanus. Drugs like antibiotics also helped to treat infectious diseases.

IMMUNITY

It is the ability of the immune system to fight the pathogens. It is 2 types: Innate and Acquired.

1. Innate (inborn) immunity

- It is the *non-specific* immunity present at the time of birth.
- It includes 4 types of Barriers:
- a. Physical barriers: Prevents entry of microbes. E.g. *Skin*, *Mucus coating* of the respiratory, gastro-intestinal and urino-genital tracts. Mucus traps microbes.
- **b. Physiological barriers:** They prevent microbial growth. E.g. gastric HCl, saliva, tear etc.
- c. Cellular barriers: Phagocytes like WBC [Polymorphonuclear leukocytes (PMNL) or neutrophils, monocytes and natural killer lymphocytes], macrophages etc.
- **d.** Cytokine barriers: Virus infected cells secrete a cytokine protein called *interferon*. It protects non-infected cells from further viral infection.

2. Acquired (adaptive) immunity

- It is *pathogen specific* immunity developed during lifetime.
- It is characterized by *memory*, i.e. during first encounter of a pathogen, body produces *primary response* in low intensity. Second encounter of the same pathogen causes a *secondary (anamnestic) response* in high intensity.
- Primary and secondary immune responses are carried out with *B-lymphocytes (B-cells)* and *T-lymphocytes (T-cells)*.
 - **a. B-lymphocytes:** Produce *antibodies*. These are the proteins to fight the pathogens.
 - b. T-lymphocytes: Help B-cells to produce antibodies.

Types of Acquired immune response

1. Humoral immune response/ Antibody mediated immunity (AMI): It is the immune response mediated by *antibodies.* Antibodies are found in blood plasma. So called as Humoral immune response.

CLICK HERE

2

🕀 www.studentbro.in

 Cell-mediated response / cell-mediated immunity (CMI): It is the immune response mediated by <i>T-lymphocytes (T-cells)</i>. The body can differentiate 'self' and 'non-self' and the CMI causes Graft rejection. Tissue matching & blood group matching are essential before undertaking any graft/ transplant. After this, the patient should take immuno-suppressants all his life. Types of Acquired immunity Acquired immunity is 2 types: Active and passive. Active immunity: It is the immunity in which antibodies are produced in a host body when the host is exposed to <i>antigens</i> (e.g. living or dead microbes or other proteins). It is a slow process. It is produced by 2 ways: 	 Treatment: Drugs like <i>anti-histamine</i>, <i>adrenaline</i> and <i>steroids</i> quickly reduce the symptoms of allergy. Asthma is a respiratory disease due to allergy. Modern-day life style and protected environment provided early in life result in low immunity and more sensitivity to allergens. So, many children in metro cities suffer from allergies and asthma. Autoimmunity In higher vertebrates, memory-based acquired immunity evolved based on the ability to differentiate foreign organisms from self-cells. Sometimes, due to genetic and other unknown reasons, the body attacks self-cells resulting in damage to the body. It is
a. Natural Active Immunity: It is developed during	called auto-immune disease. E.g. Rheumatoid arthritis.
natural infection by microbes.	AIDS (Acquired Immuno Deficiency
b. Artificial Active Immunity: It is developed by injecting	Syndrome)
the microbes deliberately during immunization.	 It is the deficiency of immune system.
2. Passive immunity: Here, readymade antibodies are	 Syndrome means a group of symptoms.
a Natural Passive Immunity: E a	• It is caused by HIV (Human Immunodeficiency Virus) ,
 Antibodies (IgG) from mother → Placenta → Foetus 	a retrovirus having RNA genome.
 Antibodies (IgA) in colostrum → infants 	 AIDS was first reported in America (1981). In the last 25 years, it killed over 25 million persons
b. Artificial Passive Immunity: E.g.	• In the last 25 years, it kined over 25 minion persons.
 Anti-tetanus serum (ATS) 	Iransmission:
Immunization	 Sexual contact with infected person. Transfusion of contaminated blood & blood products
This is based on 'memory' of the immune system. 2 types:	 Transfusion of containinated blood & blood products. Sharing of infected needles
1. Active Immunization (Vaccination)	From infected mother to her child through placenta.
• In this a preparation of vaccine (antigenic proteins of	High risk people of getting HIV:
pathogen or inactivated pathogen) is introduced into the	 Individuals with multiple sexual partners.
body. It results in the development of antibodies.	 Drug addicts who take drugs intravenously.
 During actual infection, the antibodies neutralize antigens. 	 Individuals who require repeated blood transfusion.
• The vaccines also generate memory B and T-cells. They	 Children born to an HIV infected mother.
recognize the pathogen quickly.	HIV does not spread by touch or physical contact. It spreads
• E.g. Polio vaccine, Hepatitis B vaccine, DPT vaccine etc.	only through body fluids.
• Vaccines are produced using DNA recombinant technology (E.g. Henatitis B. vaccine produced from Veast)	There is a time-lag (from few months to 5-10 years) between
(L.g. Repaires by vaccine produced noin reast).	the infection and appearance of symptoms.
2. Passive immunization	Replication of retrovirus:
• It is the direct injection of pre-formed antibodies or antitoxin. It is required for quick immune response	Retrovirus Viral RNA core
 E.g. Immunization against Tetanus, snake venom etc. 	Virus infects
Allergies	Viral protein
 It is the exaggerated response of the immune system to 	coat Animal cell
certain antigens present in the environment.	Viral RNA is introduced into cell
• Allergens: Substances causing allergy. E.g. mites in dust,	Viral DNA is Cytoplasm
pollens, animal dander, fur etc.	by reverse Viral DNA incorporates into host genome
 Antibodies produced against the allergens are IgE type. 	
• IgE binds on mast cells to release chemicals like <i>histamine</i>	New viral RNA
and <i>serotonin</i> from them. It results in allergic reactions.	the infected cell
• Symptoms: Sneezing, watery eyes, running nose, difficulty	New viruses

Heroin is a depressant and slows down body functions. 2. Cannabinoids: They interact with cannabinoid receptors in the brain. Generally taken by inhalation and oral ingestion.
 Causes of cancer (Carcinogens) Physical agents: E.g. Ionizing radiations like X-rays and gamma rays and non-ionizing radiations like UV. Chemical agents: Tobacco smoke (major cause of lung cancer), vinyl chloride, caffeine, nicotine, mustard gas etc. Biological agents: E.g. oncogenic viruses, c-onc (cellular oncogenes or proto oncogenes) etc. When C-onc in normal cells is activated, the cells become oncogenic. Cancer detection and diagnosis Biopsy: A thin piece of the suspected tissue is stained and examined under microscope (histopathological studies). DRUGS, SMOKING AI DRUGS 1. Opioids: They bind to specific opioid receptors in CNS and gastrointestinal tract. E.g. morphine, heroin, brown sugar. 	 Radiotherapy: Tumour cells are irradiated lethally, without damaging surrounding normal tissues. Chemotherapy: Use of chemotherapeutic drugs. Many drugs have side effects like hair loss, anaemia etc. Immunotherapy: The patients are given biological response modifiers (e.g. α- interferon) which activates their immune system and helps in destroying the tumour. Surgery. Most cancers are treated by combination of surgery, radiotherapy and chemotherapy. Heroin (<i>smack</i> or diacetylmorphine) is a white, odourless, bitter crystalline compound. It is obtained by acetylation of morphine. It is taken by snorting and injection. Heroin is a depressant and slows down body functions. Cannabinoids: They interact with cannabinoid receptors in the brain. Generally taken by inhalation and oral ingestion. Natural cannabinoids are obtained from inflorescences of

3. Coca alkaloid or cocaine (coke or crack):

- It is obtained from coca plant Erythroxylum coca.
- It interferes with transport of neurotransmitter dopamine.
- Cocaine is usually snorted.
- It stimulates CNS producing euphoria & increased energy.
- Excessive dosage of cocaine causes hallucinations.
- *Atropa belladona & Datura* are also hallucinogenic plants. Drugs like barbiturates, amphetamines, benzodiazepines, etc. are used as medicines to treat mental illnesses like depression & insomnia. But their abuse causes impairment of physical, physiological or psychological functions.

SMOKING

- Tobacco has been used by human beings for over 400 years.
- It is smoked, chewed or used as a snuff.
- It contains many chemical substances like **nicotine** (an alkaloid). It stimulates adrenal gland to release adrenaline and nor-adrenaline, causing high BP and heart rate.
- Smoking causes cancers of lung, urinary bladder and throat, bronchitis, emphysema, coronary heart disease, gastric ulcer etc. Tobacco chewing causes oral cancer.
- Smoking increases CO content in blood and reduces oxyhaemoglobin. This causes O₂ deficiency in the body.

ADOLESCENCE & DRUG/ALCOHOL ABUSE

- Adolescence is 'a period' and 'a process' during which a child becomes mature in terms of his/her attitudes and beliefs for effective participation in society.
- Adolescence is a bridge linking childhood and adulthood (period of 12-18 years of age). It is very vulnerable phase of mental and psychological development.

Causes of drug/alcohol use in Adolescence

- Curiosity and Experimentation.
- Need for adventure and excitement.
- To escape facing problems.
- Stress from pressure to excel in academics or examination.
- Television, movies, newspapers, internet etc.
- Unstable or unsupportive family structures & peer pressure.

Addiction and Dependence

- Addiction: It is a psychological attachment (euphoria and a temporary feeling of wellbeing) with drugs and alcohol. With repeated use of drugs, the tolerance level of the receptors increases. Thus the receptors respond only to higher doses leading to greater intake and addiction.
- **Dependence:** It is the tendency of the body to manifest a characteristic and unpleasant *withdrawal syndrome* if

regular dose of drugs/alcohol is abruptly discontinued. This results in anxiety, shakiness, nausea and sweating. Dependence leads to social adjustment problems.

Effects of Drug/alcohol abuse

- Reckless behaviour, vandalism and violence.
 Coma and death due to respiratory failure, heart failure or cerebral haemorrhage.
- Drugs mixed with alcohol may cause death.
- Damage of nervous system and liver cirrhosis.
- Mental and social distress to family and friends.
- Social problems like stealing and spread of infectious diseases (e.g. AIDS, hepatitis B).
- Use of drugs and alcohol by pregnant woman affect the foetus (Foetal alcohol syndrome or FAS).
- Loss of sexual drive and necrospermia.
- Misuse of drugs by athletes (e.g. narcotic analgesics, anabolic steroids, diuretics & certain hormones to increase muscle strength and bulk and to promote aggressiveness).

Warning signs of drug/alcohol abuse in Adolescence period

- Drop in academic performance and absence from school.
- Lack of interest in personal hygiene.
- Withdrawal and isolation.
- Depression, fatigue, aggressive and rebellious behaviour.
- Change in sleeping and eating habits.
- Fluctuations in weight, appetite etc.
- Loss of interest in hobbies.
- Deteriorating relationships with family and friends.

Side effects of anabolic steroid abuse

- In males: • Acne.
- Mood swings & depression.
- Increased aggressiveness.
 Reduced testicles.
 - Kidney & liver dysfunction.
- Decreased sperm.Breast enlargement.
- Premature baldness
- Enlargement of prostate gland.

In females:

- Masculinisation
- Mood swings & depression
- Excessive hair growthDeepening of voice
- Increased aggressivenessAbnormal menstrual cycle
- Enlargement of clitoris

In adolescent male & female: Severe facial and body acne, premature closure of the growth centres of the long bones resulting in stunted growth.

Prevention and control

- 1. Avoid undue peer pressure.
- 2. Education and counselling.
- 3. Seeking help from parents and peers.
- 4. Looking for danger signs.
- 5. Seeking professional and medical help.
 - a. Psychologists and psychiatrists.
 - b. De-addiction and rehabilitation programs.
