# CURRENT ELECTRICITY

## 1. ELECTRIC CURRENT

$$I_{av} = \frac{\Delta q}{\Delta t}$$
 and instantaneous current

$$i =. \lim_{\Delta t \to 0} \frac{\Delta q}{\Delta t} = \frac{dq}{dt}$$

## 2. ELECTRIC CURRENT IN A CONDUCTOR

$$\begin{split} I &= nAeV. \\ v_d &= \frac{\lambda}{\tau}, \\ v_d &= \frac{\frac{1}{2} \left(\frac{eE}{m}\right) \tau^2}{\tau} = \frac{1}{2} \frac{eE}{m} \tau, \end{split}$$

 $I = neAV_d$ 

# 3. CURRENT DENSITY

$$\vec{J} = \frac{dI}{ds} \vec{n}$$

## 4. ELECTRICAL RESISTANCE

I = neAV<sub>d</sub> = neA 
$$\left(\frac{eE}{2m}\right) \tau = \left(\frac{ne^2\tau}{2m}\right) AE$$

$$E = \frac{V}{\ell} \quad \text{so} \qquad I = \left(\frac{ne^2\tau}{2m}\right) \left(\frac{A}{\ell}\right) V = \left(\frac{A}{\rho\ell}\right) V = V/R \implies V = IR$$

 $\boldsymbol{\rho}$  is called resistivity (it is also called specific resistance) and

 $\rho = \frac{2m}{ne^2\tau} = \frac{1}{\sigma}, \sigma \text{ is called conductivity. Therefore current in conductors}$  is proportional to potential difference applied across its ends. This is **Ohm's Law**. Units:

CLICK HERE

>>

 $R \rightarrow ohm(\Omega), \rho \rightarrow ohm - meter(\Omega - m)$ 

also called siemens,  $\sigma \rightarrow \Omega^{-1}m^{-1}$ .

Dependence of Resistance on Temperature :

 $R = R_{o}(1 + \alpha \theta).$ Electric current in resistance

$$I = \frac{V_2 - V_1}{R}$$

5. ELECTRICAL POWER P = V I

$$P = I^2 R = VI = \frac{V^2}{R}$$

$$H = VIt = I^2Rt = \frac{V^2}{R}t$$

$$H = I^2 RT$$
 Joule =  $\frac{I^2 RT}{4.2}$  Calorie

## 9. KIRCHHOFF'S LAWS

- 9.1 Kirchhoff's Current Law (Junction law)  $\sum I_m = \sum I_{out}$
- 9.2 Kirchhoff's Voltage Law (Loop law)  $\Sigma \text{ IR} + \Sigma \text{ EMF} = 0^{\circ}.$

### 10. COMBINATION OF RESISTANCES : Resistances in Series:

 $R=R_1+R_2+R_3+\ldots+R_n$  (this means  $R_{eq}$  is greater then any resistor) ) and  $V=V_1+V_2+V_3+\ldots+V_n$ 

$$V_{1} = \frac{R_{1}}{R_{1} + R_{2} + \dots + R_{n}} V ; V_{2} = \frac{R_{2}}{R_{1} + R_{2} + \dots + R_{n}} V ;$$

2. Resistances in Parallel :

$$\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

## 11. WHEATSTONE NETWORK : (4 TERMINAL NETWORK)

When current through the galvanometer is zero (null point or balance

## 13.2 Cells in Parallel:

### 15. AMMETER

A shunt (small resistance) is connected in parallel with galvanometer to convert it into ammeter. An ideal ammeter has zero resistance

Ammeter is represented as follows -

If maximum value of current to be measured by ammeter is I then  $I_{g}$  .  $R_{g} = (I - I_{g})S$ 

$$S = \frac{I_G \cdot R_G}{I - I_G} \qquad \qquad S = \frac{I_G \times R_G}{I} \qquad \text{when} \qquad I >> I_G.$$

where I = Maximum current that can be measured using the given ammeter.

### 16. VOLTMETER

A high resistance is put in series with galvanometer. It is used to measure potential difference across a resistor in a circuit.

$$V_{A} - V_{B} = \frac{\varepsilon}{R + r} . R$$

Potential gradient  $(x) \rightarrow$  Potential difference per unit length of wire

$$x = \frac{V_A - V_B}{L} = \frac{\epsilon}{R + r} \cdot \frac{R}{L}$$

### Application of potentiometer (a) To find emf of unknown cell and compare emf of two cells. In case I.

In figure (1) is joint to (2) then balance length =  $\ell_1 \epsilon_1 = x \ell_1$  ....(1)

in case II,

In figure (3) is joint to (2) then balance length =  $\ell_2$ 

$$\varepsilon_{2} = x \ell_{2} \qquad \dots (2)$$

$$\frac{\varepsilon_{1}}{\varepsilon_{2}} = \frac{\ell_{1}}{\ell_{2}}$$

$$\varepsilon_{1}, r_{2} \qquad 10$$

$$\varepsilon_{1}, r_{2} \qquad 10$$

If any one of  $\epsilon_1$  or  $\epsilon_2$  is known the other can be found. If x is known then both  $\epsilon_1$  and  $\epsilon_2$  can be found

Similarly, we can find the value of R<sub>2</sub> also.

Potentiometer is ideal voltmeter because it does not draw any current from circuit, at the balance point.

#### (c) To find the internal resistance of cell. Ist arrangement 2<sup>nd</sup> arrangement

R,

by first arrangement  $\epsilon' = x \ell_1$  ...(1) by second arrangement IR =  $x \ell_2$ 

(d)Ammeter and voltmeter can be graduated by potentiometer. (e)Ammeter and voltmeter can be calibrated by potentiometer.

#### 18. METRE BRIDGE (USE TO MEASURE UNKNOWN RESISTANCE)

If  $AB = \ell \text{ cm}$ , then  $BC = (100 - \ell) \text{ cm}$ .

Resistance of the wire between A and B ,  $R \propto \ell$ 

[  $\because$  Specific resistance  $\rho$  and cross-sectional area A are same for whole of the wire ]

or  $R = \sigma \ell$  ...(1) where  $\sigma$  is resistance per cm of wire.

If P is the resistance of wire between A and B then  $P \propto \ell \implies P = \sigma(\ell)$ Similarly, if Q is resistance of the wire between B and C, then  $Q \propto 100 - \ell$   $\therefore \qquad Q = \sigma(100 - \ell) \qquad ....(2)$ Dividing (1) by (2),  $\frac{P}{Q} = \frac{\ell}{100 - \ell}$ 

**CLICK HERE** 

>>

Applying the condition for balanced Wheatstone bridge, we get R Q = P X

 $\therefore \qquad x = R \frac{Q}{P} \qquad \qquad \text{or} \qquad X = \frac{100 - \ell}{\ell} R$ 

Since R and  $\ell$  are known, therefore, the value of X can be calculated.
