

Solutions

Solutions

DATE

$$X_{\text{gas}} = \frac{n_{\text{gas}}}{n_{\text{gas}} + n_{\text{H}_2\text{O}}}$$

• solubility of gas in liquid : (Henry's law)

② $K_H \propto \frac{1}{\text{solubility}}$

$P \cdot P \propto \text{solubility}$

$P \cdot P \propto \text{mole fraction of gas}$

$$PP = K_H X_{\text{gas}}$$

$K_H = \text{Henry's constant of gas}$ depends on nature of gas

③ slope = $K_H = \tan \theta$

① $K_H \propto \text{Temp}$

• Factors affecting solubility of Gas :

① Nature of gas : Order of solubility

② Nature of solvent \propto Dielectric constant \propto Polarity

③ $\text{Temp} \propto \frac{1}{\text{solubility}}$

• Limitations of Henry's law :

④ $P \cdot P = K_H \text{ solubility}$
 $PP \propto \text{solubility}$

① $P = \text{low}$ $T = \text{low}$

② Gas dissolved in liq

③ Ideal gas Behaviour

• solubility of liquid in liquid :

④ V.V small amount of gas soluble in liq

① Evaporation : liquid \rightarrow Vapour

② condensation : Vapour \rightarrow liquid

$$\lambda_{\text{eva}} = \lambda_{\text{cond}}$$

(at equilibrium state)

③ At equilibrium pressure exerted by vapours on the surface area of liquid when both liquid and Vapour Both are at equilibrium

↓
Vapour pressure \rightarrow Depends only on the Temperature

classmate

PAGE

• Imp points of vapour pressure :

- ① In closed vessel.
- ② $V.P \propto \text{Temp}$
- ③ Depends on Temp and nature of liquid .
- ④ Open vessel \rightarrow evaporation
- closed vessel \rightarrow Both evaporation and condensation
- ⑤ $\text{Temp} \propto K.E$ ⑥ At Higher altitude
 $K.E = \frac{3}{2} nRT$ $P = \text{low}$
 $B.P (H_2O) < 100^\circ C$
- ⑦ In pressure cooker \rightarrow cooking time For Food $\rightarrow B.P (H_2O) \uparrow$
 Reduced
- ⑧ During eva/conden \rightarrow no. of molecules on the surface area always constant.
- ⑨ $B.P$ — Temp at which $V.P$ of liq = 1 atm
 $B.P \propto \frac{1}{V.P}$

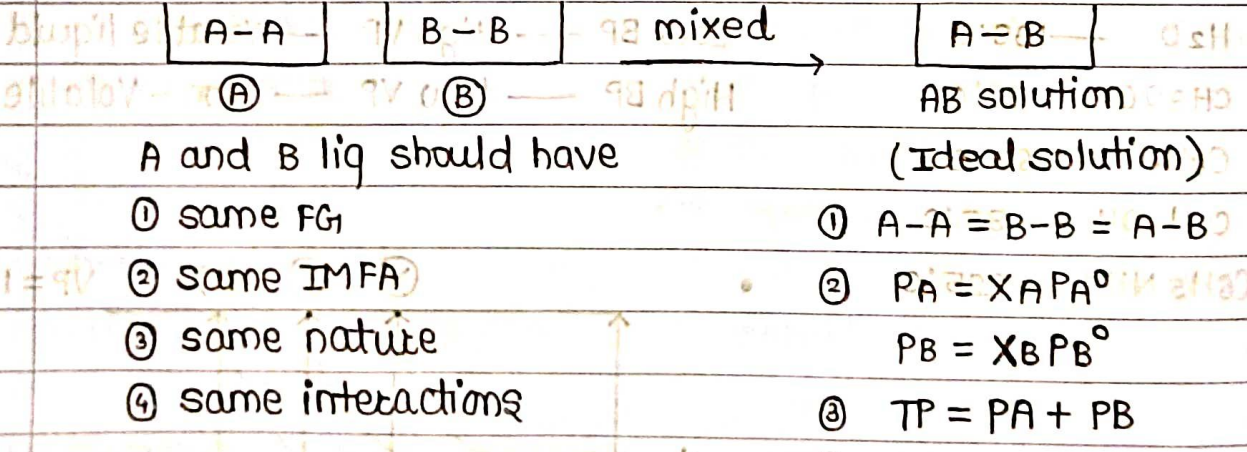

H_2O — $100^\circ C$	Low BP — High VP — Volatile liquid
CH_3OCH_3 — $38^\circ C$	High BP — Low VP — Non-Volatile liquid
C_6H_6 — $65^\circ C$	
C_2H_5OH — $85^\circ C$	
$C_6H_5NH_2$ — $225^\circ C$	

- ① BP order = $z > y > x$
- ② VP order = $z < y < x$

- Mixing of two volatile liquids (Raoult's Law 1)
 - Vapour state
 - $P_A = Y_A T P$ P_A — partial pressure of A
 - $P_B = Y_B T P$ P_B — partial pressure of B
 - Liquid state
 - $P_A = X_A P_A^0$ P_A^0 — V.P. of pure liquid A
 - $P_B = X_B P_B^0$ P_B^0 — V.P. of pure liquid B
 - X_A — MF of A in liquid state
 - X_B — MF of B in liquid state
 - Dalton's law of PP
 - Y_A — MF of A in Vap. state
 - Y_B — MF of B in Vap. state
 - TP sum of the PP
- $TP = P_A + P_B$ Total M.F = 1
 $TP = X_A P_A^0 + X_B P_B^0$ $X_A + X_B = 1$

• Ideal Solutions:
 The solution which obeys Raoult's law exactly over entire range of concentrations is called Ideal solution

• Non Ideal solutions showing deviation

- | | |
|----------------------------------|----------------------------------|
| ① +ve Deviation
V.P increases | ② -ve Deviation
V.P decreases |
|----------------------------------|----------------------------------|

① A-A and B-B strong
A-B - weak

① A-A and B-B weak
A-B - strong

② $P_A > X_A P_A^\circ$
 $P_B > X_B P_B^\circ$
 $T_P > P_A + P_B$

② $P_A < X_A P_A^\circ$
 $P_B < X_B P_B^\circ$
 $T_P < P_A + P_B$

③ $\Delta H_{mix} > 0$ — endothermic

③ $\Delta H_{mix} < 0$ — exothermic

④ $\Delta V_{mix} > 0$ — Volume increases

④ $\Delta V_{mix} < 0$ — Volume decreases

ex: $CH_3COCH_3 + C_2H_5OH$
 $CH_3COCH_3 + \text{ether}$

ex: $H_2O + CH_3COOH$
 $H_2O + HCl$

$CCl_4 + CH_3OH$

$CH_3OH + CH_3COOH$

$H_2O + CH_3OH$

$CHCl_3 + CH_3COCH_3$

$CH_3COCH_3 + CS_2$

$CHCl_3 + C_6H_6$

$C_6H_5NH_2 + CH_3COCH_3$

$X_A = 1$
 $X_B = 0$

$X_B = 1$
 $X_A = 0$

+ve Deviation

-ve Deviation

V.P Increases

V.P Decreases

$X_A + X_B = 1$

- Azeotropic mixture: A mixture of 2 or more components can boil at same temp and can't be separated by distillation process called Azeotropic mixture

• Note:

- ① Non-Ideal solution give azeotropic mixture.
- ② After mixing V.P of both liquids inc or dec than pure liquids
- ③ After mixing BP of both liquids inc or dec than pure liquids
- ④ Means BP of Azeotropic mixture \rightarrow Greater or lesser than BP of pure liquids
- ⑤ B.P of both liquids same \rightarrow At this BP composition of both liquid phase and vapour phase are same.

• Colligative properties:

Properties depends on No. of solute particles but not nature of solute is called colligative properties.

① Relative lowering of V.P:

On addition of Non volatile solids solute, V.P of solvent decreases called lowering of vapour pressure.

a) $LVP = P^s - P^0$ ($P^s =$ Vapour P of solution / $P^0 =$ Vapour P of solvent)

b) $RLVP = \frac{LVP}{P^0} = \frac{P^0 - P^s}{P^0}$ (Value Increases)

c) $RLVP = X_{\text{solute}}$ — According to Raoult's law

d) $\frac{P^0 - P^s}{P^0} = \frac{n}{N}$ — Find $P^0 / P^s / LVP / RLVP$

e) $\frac{P^0 - P^s}{P^0} = \frac{wt}{m.wt} \times \frac{M.wt}{Wt}$ — Find M.wt of solute

$$f) \frac{p^0 - p^s}{p^0} = m \times \frac{M \cdot wt}{1000} \quad m - \text{molality}$$

- Elevation of BP (ΔT_b)
On addition of Non volatile solute, V.P of solvent decreases
So BP of solution increases called elevation of B.P.

$$T_b^s > T_b^0$$

$$\textcircled{1} \Delta T_b = T_b^s - T_b^0 \quad (T_b^s = \text{B.P of solution} / T_b^0 = \text{B.P of pure solvent})$$

$$\textcircled{2} \Delta T_b = k_b m \quad k_b = \text{Ebullioscopic / molal elevation / B.P of}$$

elevation constant

→ Elevation of BP at conc of solⁿ 1 molal

$$\textcircled{3} T_b^s - T_b^0 = k_b \times \frac{wt}{mwt} \times \frac{1000}{Mwt}$$

- Depression of Freezing point (ΔT_f):

On addition of Non volatile solute V.P of solution decreases
So FP of solution decreases called Depression of FP.

$$T_f^0 > T_f^s$$

$$\textcircled{1} \Delta T_f = T_f^0 - T_f^s \quad (T_f^0 = \text{FP of solvent} / T_f^s = \text{FP of solution})$$

$$\textcircled{2} \Delta T_f = k_f m \quad k_f = \text{cryoscopic / F.P depression constant}$$

$$\textcircled{3} \Delta T_f = k_f \times \frac{wt}{mwt} \times \frac{1000}{Wg}$$

- Osmotic pressure:

- Moving of solvent molecules High conc → Low conc through

semi-permeable membrane called osmosis

- The external pressure applied on the piston to stop the osmosis called osmotic pressure.

$$\textcircled{1} \pi = CST \quad (C = \text{conc} = \text{molality} = \frac{n}{V} = \frac{wt}{mwt} \times \frac{1}{V} = \frac{wt \times 1000}{mwt \cdot V_{ml}})$$

$$S = R = 0.0821 = \frac{1}{12}$$

② Two solutions mixed $\pi_{RS} = \pi_1 + \pi_2$
 $= C_1 S T_1 + C_2 S T_2$
 $= C_1 S T + (C_2 S T)$
 $= (C_1 + C_2) S T$

③ A and B two solutions

- a. $OP(A) < OP(B)$ — A is hypotonic than B
- b. $OP(A) = OP(B)$ — A is isotonic than B
- c. $OP(A) > OP(B)$ — A is hypertonic than B

• A and B are isotonic solution

$\pi_A = \pi_B$
 $C_1 S T_1 = C_2 S T_2$
 $T_1 = T_2$
 $V_1 = V_2$
 $C_1 = C_2$
 $n_1 = n_2$

• Formulae:

- ① $RLVP = i \times \text{solute}$ (i) No. of solute particles (i)
- ② $\Delta T_b = i K_b m$ (ii) Amount of solute given
- ③ $\Delta T_f = i K_f m$ (iii) No. of moles of solute ($\times \text{solute}$)
- ④ $\pi = i C S T$ (iv) conc. of solution (c)
 (v) C: concentration

$RLVP / LVP / BP / \Delta T_b / \Delta T_f / \pi = \alpha \times (i) (ii) (iii) (iv) (v)$

• According to Raoult's law:

① Dilute $\longrightarrow P^0 - P_s = \frac{wt}{mwt} \times M \cdot wt \quad \text{--- } P^0 / LVP$

② conc $\longrightarrow P^0 - P_s = \frac{wt}{mwt} \times M \cdot wt \quad \text{--- } P^s / RLVP$
 $\longrightarrow \frac{P^0 - P^s}{P_s} = \frac{wt}{mwt} \times \frac{M \cdot wt}{Wt} \quad \text{--- } \frac{m \cdot wt \text{ of solute}}{Wt}$

• A and B are isotonic solution $\longrightarrow \frac{wt_1 \times 1000}{mwt_1 V_1} = \frac{wt_2 \times 1000}{mwt_2 V_2}$

• Raoult's law: $RLVP = X_{\text{solute}}$
 $LVP = \frac{X_{\text{solute}}}{P^0}$

• Abnormal Mwt - Vanthoff Factor (i)

i = No. of solute particles \longrightarrow For dissociation $\text{--- } i > 1$
 For Association $\text{--- } i < 1$

For glucose, sucrose, Fructose, Non volatile solutes, Non electrolytic solutes \longleftarrow For diss/Associ $\text{--- } i = 1$
 Association

① For degree of dissociation (α) = $\frac{l-1}{n-1}$ $2A \longrightarrow A_2 \quad i = 1/2$
 of solute

② For degree of association (α) = $\frac{l-1}{\frac{1}{n} - 1}$ $3A \longrightarrow A_3 \quad i = 1/3$
 of solute

n = no. of particles asso/disso when $\alpha = 100\%$.

l = no. of particles asso/disso when $\alpha = 100\%$ or $\alpha \neq 100\%$.

- Relation b/w normal and abnormal wt:

① $i = \frac{\text{No. of particles asso/diss}}{\text{No. of particles taken}}$

② $i = \frac{\text{Normal wt}}{\text{Abnormal wt}}$ $\text{Abnormal wt} = \text{Normal weight}$

$i = \frac{\text{Normal wt}}{\text{Abnormal wt}}$ $\text{Abnormal wt} = \text{Normal weight}$

• A and B are isotonic solution $\rightarrow \text{wt} \times 1000 = \text{wt}_2 \times 1000$

• $\text{RVP} = \text{Xsolvent}$ $\text{RVP} = \text{Xsolvent}$

• $\text{Abnormal wt} = \text{Van't Hoff factor (i)}$

$i = \text{no. of solute particles}$ \rightarrow For dissociation $i > 1$
 For Association $i < 1$
 For diss/Assoc $i = 1$

• Fructose, Non volatile solutes, non electrolytic solutes
 Association

① For degree of dissociation $(\alpha) = \frac{l-1}{l}$ $2A \rightarrow 2A$ $i = 1/2$

② For degree of association $(\alpha) = \frac{l-1}{l}$ $2A \rightarrow A_2$ $i = 1/3$

③ For degree of association $(\alpha) = \frac{l-1}{l}$ $2A \rightarrow A_2$ $i = 1/3$

$l = \text{no. of particles asso/diss}$ when $\alpha = 100\%$
 $n = \text{no. of particles asso/diss}$ when $\alpha \neq 100\%$

- Relation b/w normal and abnormal wt :
