Since variance is independent of change of origin. Hence, variance of observations 101, 102, ..., 200 is same as variance of observations 151, 152, ..., 250.

$$\therefore V_A = V_B$$

The variable a X + b takes values $a x_1 + b$, $a x_2 + b$ $b, \dots, a x_n + b$ with mean $a \overline{X} + b$

Let $x_1, x_2, ..., x_n$ be a raw data. Then,

$$\sigma^2 = \frac{1}{n} \sum_{i=1}^n \left(x_i - \overline{X} \right)^2$$

If each value is multiplied by h, then the values are $h x_1, h x_2, ..., h x_n$. The AM of the new values is

$$\frac{h x_1 + h x_2 + \dots + h x_n}{n} = h \, \overline{X}$$

The variance σ_1^2 of the new set of values is given

$$\sigma_1^2 = \frac{1}{n} \sum_{i=1}^n (h x_i - h \overline{X})^2 = h^2 \left\{ \frac{1}{n} \sum_{i=1}^n (x_i - \overline{X})^2 \right\}$$

Substituting those values in (i), we have

$$25 = \frac{26 n_1 + 21(100 - n_1)}{100} \Rightarrow n_1 = 80$$

Since, there are 19 observations. So, the middle term is 10th

After including 8 and 32, *ie*, 8 will come before 30 and 32 will come after 30

Here, new median will remain 30

$$\Rightarrow 11x + 55 = 2761$$

$$\Rightarrow x = \frac{2761 - 55}{11} = 246$$

: Middle number = x + 5 = 246 + 5 = 251

We have, $4\bar{x} + 3\bar{y} + 7 = 0$... (i)

Given that,

$$\therefore 6 = \frac{4 \times 7.5 + 6 \times \bar{x}_2}{10}$$

$$6 = \frac{10}{10}$$

184 (a)

It is true that median and mode can be determined graphically

186 (b)

Given that, $\sum_{i=1}^{20} (x_i - 30) = 2$

$$\Rightarrow \sum_{i=1}^{20} x_i - \sum_{i=1}^{20} (30) = 2$$

$$\Rightarrow \bar{x} = \frac{20.30}{20} + \frac{2}{20}$$

Let the number of boys and girls be x and y

Since,

$$\Rightarrow 4 = \frac{2na^2}{2n}$$

$$\Rightarrow a^2 = 4$$

$$\Rightarrow |a| = 2$$

190 (b)

The required mean is given by

$$\overline{X} = \frac{1 \cdot 1^2 + 2 \cdot 2^2 + 3 \cdot 3^2 + \dots + n \cdot n^2}{1^2 + 2^2 + \dots + n^2} = \frac{\sum n^3}{\sum n^2}$$

$$\Rightarrow \overline{X} = \frac{\left\{\frac{n(n+1)^2}{2}\right\}^2}{\frac{n(n+1)(2n+1)}{6}} = \frac{3n(n+1)}{2(2n+1)}$$

193 (c)

Here, n = 7, sum=315

$$= \sqrt{\frac{2(1089+484+121)}{7}} = \sqrt{\frac{3388}{7}}$$

$$\sqrt{484} = 22$$

194 (a)

We know,

Where $d_1 = m_1 - a$, $d_2 = m_2 - a$, a being the mean of the whole group

$$\therefore 15.6 = \frac{100 \times 15 + 150 \times m_2}{250}$$

$$\Rightarrow m_2 = 16$$
Thus, $13.44 = \frac{[(100 \times 9 + 150 \times \sigma^2) + 100 \times (0.6)^2 + 150 \times (0.4)^2]}{[(100 \times 9 + 150 \times \sigma^2) + 100 \times (0.6)^2 + 150 \times (0.4)^2]}$

 $\Rightarrow \sigma = 4$

Statement (2) and (3) are correct

The ascending order of the given data are 34, 38, 42,44,46,48, 54,55,63, 70

Hence, Median, $M = \frac{46+48}{2} = 47$

The required mean is given by

 $\Rightarrow 4 = \frac{100}{n} - \frac{400}{n^2}$
 $\Rightarrow n^2 - 25n + 100 = 0$
 $\Rightarrow n = 20,5$

200 (a)

 $^{2n}C_0$, $^{2n}C_1$, $^{2n}C_{2,\dots,}^{2n}C_n$ are binomial coefficients which are in odd numbers (because n is even) and middle binomial coefficient is ${}^{2n}C_{n/2}$ which is required median.

Now,
$$\mu'_1 = \frac{\sum_{r=0}^n r^n C_r}{\sum_{r=0}^n n_{C_r}} = \frac{n \cdot 2^{n-1}}{2^2} = \frac{n}{2}$$

 $\mu'_2 = \frac{\sum_{r=0}^n r^2 n_{C_r}}{\sum_{r=0}^n n_{C_r}} = \frac{n(n-1)}{2^2} \cdot 2^{n-2} + \frac{n}{2}$
 $n(n-1) n$

 $-\frac{1}{4}\frac{1}{2}$ \therefore Variance,

$$\mu_2' = (\mu_2') - (\mu_2')^2 = \frac{n(n-1)}{4} + \frac{n}{2} - \frac{n^2}{4} = \frac{n}{4}$$

208 (b)

The slopes of the lines of regression of y on x and x on y are $m_1 = b_{yx}$ and $m_2 =$

 $\frac{1}{b_{xy}}$ respectively. Therefore, the angle between

them is given by

$$tan\theta = \frac{m_1 - m_2}{1 + m_1 m_2} = \frac{b_{yx} - \frac{1}{b_{xy}}}{1 + \frac{b_{yx}}{b_{xy}}}$$
$$\Rightarrow \theta = tan^{-1} \left(\frac{b_{yx} \times b_{xy} - 1}{b_{yx} + b_{xy}}\right)$$

209 (b)

Given that,
$$\bar{x} = \frac{x_1 + x_2 + ... + x_n}{n}$$

 $\Rightarrow n\bar{x} = x_1 + x_2 + ... + x_n$
Now, required mean $= \frac{2x_1 + 3 + ... + 2x_n + 3}{n}$
 $= \frac{2(x_1 + x_2 + ... + x_n) + 3n}{n}$
 $= \frac{2n\bar{x} + 3n}{n} = 2\bar{x} + 3$

210 (d)

Required mean =
$$\frac{0. {^{n}C_{0}+1. ^{n}C_{1}+2. ^{n}C_{2...+n. ^{n}C_{n}}}{{^{n}C_{0}+^{n}C_{1}+^{n}C_{2}+...+^{n}C_{n}}}$$
$$=\frac{n. 2^{n-1}}{2^{n}}=\frac{n}{2}$$

212 (d)

Standard deviation

$$= \sqrt{\frac{\sum_{j=1}^{18} (x_j - 8)^2}{n}} - \left(\frac{\sum_{j=1}^{18} (x_j - 8)}{n}\right)^2$$

$$= \sqrt{\frac{45}{18}} - \left(\frac{9}{18}\right)^2$$

$$= \sqrt{\frac{45}{18}} - \frac{1}{4} = \sqrt{\frac{81}{36}}$$

$$= \frac{9}{6} = \frac{3}{2}$$

214 (b)

Mean =
$$\frac{0^2 + 1^2 + 2^2 + 3^2 + \dots + n^2}{(n+1)}$$
$$= \frac{n(n+1)(2n+1)}{6(n+1)} = \frac{1}{6}n(2n+1)$$

215 (b)

Standard deviation does not depend on origin but it depends on scale, so,

$$\frac{ax+b}{c} = \frac{ax}{c} + \frac{b}{c}$$

 \Rightarrow Standard deviation of $\frac{ax+b}{c}$ is $\frac{a\sigma}{c}$.

216 (c)

Let the number of girls in the class = y

 \therefore Number of boys in the class = 100 - y

Now,
$$\bar{x}_1 = 25$$
, $n_1 = y$, $\bar{x}_2 = 50$, $n_2 = 100 - y$ and $\bar{x} = 35$, $n_1 + n_2 = 100$

$$35 = \frac{25 \times y + 50 \times (100 - y)}{100}$$

$$\Rightarrow 3500 = 25y + 5000 - 50y$$

$$\Rightarrow$$
 25 $y = 1500 \Rightarrow y = 60$

∴ Number of girls in the class = 60

218 (c)

 \because Total marks of 10 failed students = $28 \times 10 = 280$

and Total marks of 50 students = 2800

 \therefore Total marks of 40 passed students = 2800 - 280 = 2520

∴ Average marks of 40 passed students = $\frac{2520}{40}$ = 63

220 (c)

=(n+1)

The given series is 1,2,3,...(2n+1)

$$\bar{x} = \frac{1+2+3+\dots+(2n+1)}{2n+1}$$

$$= \frac{(2n+1)(2n+2)}{2(2n+1)}$$

221 (b)

$$: \sigma_x^2 = 4and\sigma_y^2 = 5$$

Also
$$\bar{x} = 2$$
 and $\bar{y} = 4$

Now,
$$\frac{\Sigma x_i}{5} = 2 \Rightarrow \Sigma x_i = 10$$

$$\frac{\Sigma y_i}{5} = 4 \Rightarrow \Sigma y_i = 20$$

Since
$$\sigma_x^2 = \frac{1}{5}(\Sigma x_i^2) - (\bar{x})^2$$

$$\Rightarrow \Sigma x_i^2 = 40$$

Similarly $\Sigma x_i^2 = 105$

$$\therefore \sigma_x^2 = \frac{1}{10} (\Sigma x_i^2 + \Sigma y_i^2) - (\frac{\bar{x} + \bar{y}}{2})^2$$

$$= \frac{1}{10} (40 + 105) - 9$$

$$= \frac{55}{10} = \frac{11}{2}$$

223 (a)

Given,
$$\sigma_x^2 = 9$$

And lines of regression are

$$4x - 5y + 33 = 0.20x - 9y - 10 = 0$$

Ie, $y = \frac{4}{5}x + \frac{33}{5}$ and $x = \frac{9}{20}y + \frac{10}{20}$

::Regression coefficient are

$$b_{yx} = \frac{4}{5}$$
 and $b_{xy} = \frac{9}{20}$

Now,
$$b_{yx} = \frac{cov(x,y)}{\sigma_x^2}$$

$$\Rightarrow cov(x,y) = \frac{4}{5} \times 9 = \frac{36}{5}$$

And
$$b_{xy} = \frac{cov(x,y)}{\sigma_y^2}$$

$$\Rightarrow \sigma_y^2 = \frac{36}{5} \times \frac{20}{9} = 16$$

Now,
$$p(x, y) = \frac{cov(x, y)}{\sigma_x \sigma_y} = \frac{36}{5 \times 3 \times 4} = 0.6$$

224 (d)

$$\begin{aligned} &\text{Mean=} \frac{0 \times^{n} C_{0} + 1 \times^{n} C_{1} + 2 \times^{n} C_{2} + ... + n \times^{n} C_{n}}{n_{C_{0}} + n_{C_{1}} + n_{C_{2}} + ... + n_{C_{n}}} \\ &= \frac{0 + 1 \times^{n} C_{1} + 2 \times^{n} C_{2} + ... + n \times^{n} C_{n}}{2^{n}} \\ &= \frac{n \cdot 2^{n-1}}{2^{n}} = \frac{n}{2} \end{aligned}$$

226 (c)

The sum of all the four digit numbers using the digits 3, 5, 7 and 9

$$= (3+5+7+9) \times (4-1)! \left(\frac{10^4-1}{10-1}\right)$$
$$= 24 \times 6 \times \left(\frac{10^4-1}{10-1}\right)$$
$$= \frac{24 \times 6 \times 9999}{9}$$

$$\therefore \text{ Required average} = \frac{24 \times 6 \times 9999}{9 \times 24} = 6666$$

227 (d)

Let n_1 and n_2 be the number of observations in two groups having means \overline{X}_1 and \overline{X}_2 respectively. Then

$$\overline{X} = \frac{n_1 \overline{X}_1 + n_2 \overline{X}_2}{n_1 + n_2}$$

Now.

$$\begin{split} \overline{X} - \overline{X}_1 &= \frac{n_1 \overline{X_1} + n_2 \overline{X}_2}{n_1 + n_2} - \overline{X}_1 \\ \Rightarrow \overline{X} - \overline{X}_1 &= \frac{n_2 (\overline{X}_2 - \overline{X}_1)}{n_1 + n_2} > 0 \quad \left[\because \overline{X}_2 > \overline{X}_1 \right] \\ \Rightarrow \overline{X} > \overline{X}_1 \quad \dots \text{(i)} \end{split}$$

And,
$$\overline{X} - \overline{X}_2 = \frac{n(\overline{X}_1 - \overline{X}_2)}{n_1 + n_2} < 0 \quad [\because \overline{X}_2 > \overline{X}_1]$$

$$\Rightarrow \overline{X} < \overline{X}_2$$
 ... (ii)

From (i) and (ii), we have $\overline{X}_1 < \overline{X} < \overline{X}_2$

Mean of
$$1^2, 2^2, 3^2, \dots, n^2$$
 is
$$\frac{1^2 + 2^2 + 3^3 + \dots n^2}{n} = \frac{\Sigma n^2}{n}$$

$$\frac{46n}{11} = \frac{n(n+1)(2n+1)}{6n}$$

$$\Rightarrow 22n^2 + 33n + 11 - 276n = 0$$

$$\Rightarrow (n-11)(22n-1) = 0$$

$$\Rightarrow n = 11 \text{ and } n \neq \frac{1}{22}$$

$$\Rightarrow \frac{\sum x_i^2}{n} - \left(\frac{\sum x_i}{n}\right)^2 \ge 0$$

$$\Rightarrow \frac{400}{n} - \frac{6400}{n^2} \ge 0$$
$$\Rightarrow n \ge 16$$
$$\therefore n = 18$$
