Sample Question Paper <u>CLASS: XII</u> Session: 2021-22 Mathematics (Code-041) Term - 2

Time Allowed: 2 hours

General Instructions:

- 1. This question paper contains **three sections A, B and C**. Each part is compulsory.
- 2. Section A has 6 short answer type (SA1) questions of 2 marks each.
- 3. Section B has 4 short answer type (SA2) questions of 3 marks each.
- 4. Section C has 4 long answer type questions (LA) of 4 marks each.
- 5. There is an **internal choice** in some of the questions.
- 6. Q14 is a **case-based problem** having 2 sub parts of 2 marks each.

| | Find the particular solution of the following differential equation, given that y | |
| | = 0 when $x = \frac{\pi}{4}$: | |
| | 1 | |
| | $\frac{dy}{dx} + ycotx = \frac{2}{1+sinx}$ | |
| | ax = 1 + sinx Solution: | |
| | The differential equation is a linear differential equation | |
| | $I F = e^{\int cotx dx} = e^{\log sinx} = sinx$ | 1 |
| | The general solution is given by | |
| | $ysinx = \int 2\frac{sinx}{1+sinx} dx$ | 1/2 |
| | | , 2 |
| | $\Rightarrow ysinx = 2 \int \frac{sinx + 1 - 1}{1 + sinx} dx = 2 \int [1 - \frac{1}{1 + sinx}] dx$ | |
| | $\Rightarrow ysinx = 2\int \left[1 - \frac{1}{1 + \cos\left(\frac{\pi}{2} - x\right)}\right] dx$ | |
| | $\Rightarrow ysinx = 2 \int \left[1 - \frac{1}{2cos^2 \left(\frac{\pi}{4} - \frac{x}{2}\right)}\right] dx$ | |
| | $\Rightarrow ysinx = 2\int \left[1 - \frac{1}{2}sec^2\left(\frac{\pi}{4} - \frac{x}{2}\right)\right]dx$ | |

| 13. | Find the foot of the perpendicular from the point (1, 2, 0) upon the plane | |
| | x - 3y + 2z = 9. Hence, find the distance of the point (1, 2, 0) from the given plane. Solution: The equation of the line perpendicular to the plane and passing through the point (1, 2, 0) is $x - 1$ $y - 2$ z | 1 |
| | $\frac{1}{1} = \frac{1}{-3} = \frac{1}{2}$ The coordinates of the foot of the perpendicular are $(\mu + 1, -3\mu + 2, 2\mu)$ for some μ These coordinates will satisfy the equation of the plane. Hence, we have | 1/2 |
| | $\mu + 1 - 3(-3\mu + 2) + 2(2\mu) = 9$ $\Rightarrow \mu = 1$ The foot of the perpendicular is (2, -1, 2). Hence, the required distance = $\sqrt{(1-2)^2 + (2+1)^2 + (0-2)^2} = \sqrt{14}$ units | 1 ½ 1 |

| An insurance company believes that people can be divided into two classes: those | e who are |
| accident prone and those who are not. The company's statistics show that an accid | ent-prone |
| person will have an accident at sometime within a fixed one-year period with proba | ability 0.6, |
| whereas this probability is 0.2 for a person who is not accident prone. The company k | nows that |
| 20 percent of the population is accident prone. | |
| Based on the given information, answer the following questions. | |
| (i)what is the probability that a new policyholder will have an accident within a year of purchasing a policy? | |
| (ii) Suppose that a new policyholder has an accident within a year of purchasing a policy. What is the probability that he or she is accident prone? | |
| Solution: Let E ₁ = The policy holder is accident prone. E ₂ = The policy holder is not accident prone. E = The new policy holder has an accident within a year of purchasing a | |
| policy. (i) $P(E)=P(E_1) \times P(E/E_1) + P(E_2) \times P(E/E_2)$ | 1 |
| $=\frac{20}{100} \times \frac{6}{10} + \frac{80}{100} \times \frac{2}{10} = \frac{7}{25}$ | 1 |
| (ii) By Bayes' Theorem, $P(E_1/E) = \frac{P(E_1) \times P(E/E_1)}{P(E)}$ | 1 |
| $=\frac{\frac{20}{100}\times\frac{6}{10}}{\frac{280}{1000}}=\frac{3}{7}$ | 1 |
