Class XI Session 2023-24 **Subject - Mathematics** Sample Question Paper - 7

Time Allowed: 3 hours

General Instructions:

- 1. This Question paper contains five sections A, B, C, D and E. Each section is compulsory. However, there are internal choices in some questions.
- 2. Section A has 18 MCQ's and 02 Assertion-Reason based questions of 1 mark each.
- 3. Section B has 5 Very Short Answer (VSA)-type questions of 2 marks each.
- 4. Section C has 6 Short Answer (SA)-type questions of 3 marks each.
- 5. Section D has 4 Long Answer (LA)-type questions of 5 marks each.
- 6. Section E has 3 source based/case based/passage based/integrated units of assessment (4 marks each) with sub parts.

Section A					
1.	$\frac{\cos 8^\circ - \sin 8^\circ}{\cos 8^\circ + \sin 8^\circ} = ?$		[1]		
	a) tan 52°	b) tan 37°			
	c) None of these	d) tan 8°			
2.	The domain and range of real function f defined by f (x) = $\sqrt{x-1}$ is given by				
	a) Domain $= [\infty, \infty)$, Range $= [0, \infty)$	b) Domain $= [1,\infty),$ Range $= (\infty,\infty)$			
	c) Domain $= [1,\infty)$, Range $= [0,\infty)$	d) Domain $=(1,\infty)$, Range $=(0,\infty)$			
3.	The mean and the variance of 10 observations are given to be 4 and 2 respectively. If every observation is multiplied by 2, the mean and the variance of the new series will be respectively.				
	a) 8 and 4	b) 8 and 20			
	c) 8 and 8	d) 80 and 40			
4.	If G(x) = $\sqrt{25 - x^2}$ then $\lim_{x \to 1} \frac{G(x) - G(1)}{x - 1}$ has the value		[1]		
	a) $\frac{1}{24}$	b) $-\sqrt{24}$			
	c) $\frac{-1}{\sqrt{24}}$	d) $\frac{1}{5}$			
5.	The equations of the sides AB, BC and CA of \triangle ABC are y - x = 2, x + 2y = 1 and 3x + y + 5 = 0 respectively.		[1]		
	The equation of the altitude through B is				
	a) $3x - y + 2 = 0$	b) x - $3y + 4 = 0$			
	c) x - $3y + 1 = 0$	d) None of these			
6.	Equation of y-axis is considered as		[1]

Maximum Marks: 80

	a) $y = 0, z = 0$	b) none of these	
	c) $z = 0, x = 0$	d) $x = 0, y = 0$	
7.	If $z = x + iy$; $x, y \in R$ then :		[1]
	a) $zar{z} < z ^2$	b) $zar{z}= z ^2$	
	c) $zar{z} > z ^2$	d) none of these	
8.	${}^5\mathrm{C}_1 + {}^5\mathrm{C}_2 + {}^5\mathrm{C}_3 + {}^5\mathrm{C}_4 + {}^5\mathrm{C}_5$ is equal to		[1]
	a) 33	b) 30	
	c) 31	d) 32	
9.	$\lim_{x \to 0} rac{ an 2x - x}{3x - \sin x}$ is equal to		[1]
	a) $\frac{1}{2}$	b) 2	
	c) $\frac{1}{4}$	d) $-\frac{1}{2}$	
10.	If the arcs of the same length in two circles subtend angles of 60° and 75° at their respective centres, the ratio of their radii is		[1]
	a) 5 : 3	b) 3 : 5	
	c) 5 : 4	d) 4:5	
11.	For any two sets A and B, $A \cap (A \cup B)$ =		[1]
	a) none of these	b) B	
	c) <i>φ</i>	d) A	
12.	The integral part of $(\sqrt{2}+1)^6$ is		[1]
	a) 98	b) 96	
	c) 99	d) 100	
13.	If $x = 99^{50} + 100^{50}$ and $y = (101)^{50}$ then		[1]
	a) x < y	b) x > y	
	c) x = y	d) $x \geq y$	
14.	If x and a are real numbers such that $a > 0$ and $ x > a$,	then	[1]
	a) $x\in (-a,\infty)$	b) $x\in(-\infty,-a)\cup(a,\infty)$	
	c) $\mathbf{x} \in$ (-a, a)	d) $x\in [-\infty,a]$	
15.	Let R be set of points inside a rectangle of sides a and b (a, b > 1) with two sides along the positive direction of x-axis and y-axis. Then		[1]
	a) R = {(x, y) : $0 \le x \le a, 0 \le y \le b$ }	b) R = {(x, y) : $0 \le x \le a, 0 \le y \le b$ }	
	c) R = {(x, y) : $0 < x < a, 0 < y < b$ }	d) R = {(x, y) : $0 \le x \le a, 0 < y < b$ }	
16.	If A + B + C = π , then $\frac{\tan A + \tan B + \tan C}{\tan A \tan B \tan C}$ is equal to		[1]
	a) 1	b) tan A tan B tan C	
	c) None of these	d) 0	
			[1]

Differentiate $(x^2 + 1)(x - 5)$ from first principle. 29.

OR

Find the derivative of the following functions from first principle. $\frac{x+1}{x-1}$

If A.M. and G.M. of roots of a quadratic equation are 8 and 5 respectively then obtain the quadratic equation. 30. [3]

OR

If the sum of an infinite decreasing G.P. is 3 and the sum of the squares of its term is $\frac{9}{2}$, then write its first term and common difference.

Out of 25 members in a family, 12 like to take tea, 15 like to take coffee and 7 like to take coffee and tea both. [3] 31. How many like

i. at least one of the two drinks

- ii. only tea but not coffee
- iii. only coffee but not tea
- iv. neither tea nor coffee

Section D

- 32. Calculate the mean deviation about the mean of the set of first n natural numbers when n is an even number. [5]
- [5] 33. Find the vertex, axis, focus, directrix, latus - rectum of the following parabolas. Also, draw their rough sketches:

 $y = x^2 - 2x + 3$.

OR

Find the eccentricity, centre, vertices, foci, minor axis, major axis, directrices and latus-rectum of the ellipse $25x^2$ + $9y^2 - 150x - 90y + 225 = 0.$

Solve the following system of linear inequalities 34. [5] - 2 - $\frac{x}{4} \ge \frac{1+x}{3}$ and 3 - x < 4(x-3) [5]

35. If 2 tan
$$\alpha$$
 = 3 tan β , prove that tan (α - β) = $\frac{\sin 2\beta}{5 - \cos 2\beta}$

OR

If sec $(x + \alpha) + \sec(x - \alpha) = 2 \sec x$, prove that $\cos x = \pm \sqrt{2} \cos \frac{\alpha}{2}$.

Section E

36. Read the text carefully and answer the questions:

Method to Find the Sets When Cartesian Product is Given

For finding these two sets, we write first element of each ordered pair in first set say A and corresponding second element in second set B (say).

Number of Elements in Cartesian Product of Two Sets

If there are p elements in set A and q elements in set B, then there will be pq elements in $A \times B$ i.e. if n(A) = pand n(B) = q, then $n(A \times B) = pq$.

- The Cartesian product A \times A has 9 elements among which are found (-1, 0) and (0, 1). Find the set A and (i) the remaining elements of $A \times A$.
- A and B are two sets given in such a way that A imes B contains 6 elements. If three elements of A imes B are (ii) (1, 3), (2, 5) and (3, 3), then find the remaining elements of $A \times B$.
- (iii) If the set A has 3 elements and set B has 4 elements, then find the number of elements in A \times B.

OR

CLICK HERE

If $A \times B = \{(a, 1), (b, 3), (a, 3), (b, 1), (a, 2), (b, 2)\}$. Find A and B.

37. Read the text carefully and answer the questions:

Page 4 of 18

[4]

[4]

Four friends Dinesh, Yuvraj, Sonu, and Rajeev are playing cards. Dinesh, shuffling a cards and told to Rajeev choose any four cards.

- (i) What is the probability that Rajeev getting all face card.
- (ii) What is the probability that Rajeev getting two red cards and two black card.
- (iii) What is the probability that Rajeev getting one card from each suit.

OR

What is the probability that Rajeev getting two king and two Jack cards.

38. **Read the text carefully and answer the questions:**

We have, $i = \sqrt{-1}$. So, we can write the higher powers of i as follows

ii.
$$i^3 = i^2 \cdot i = (-1) \cdot i = -i$$

iii.
$$i^4 = (i^2)^2 = (-1)^2 = 1$$

iv.
$$i^5 = i^{4+1} = i^4 \cdot i = 1 \cdot i = i$$

v.
$$i^6 = i^{4+2} = i^4 \cdot i^2 = 1 \cdot i^2 = -1...$$

In order to compute i^n for n > 4, write

$$\mathrm{i}^{\mathrm{n}}$$
 = $\mathrm{i}^{4\mathrm{q}+\mathrm{r}}$ for some q, $\mathrm{r}\in\mathrm{N}$ and $0\leq\mathrm{r}\leq3.$ Then, i^{n} = $\mathrm{i}^{4\mathrm{q}}\cdot\mathrm{i}^{\mathrm{n}}$

$$=(i^4)^q \cdot i^r = (1)^q \cdot i^r = i^r$$

In general for any integer k

$$i^{4k} = 1$$
, $i^{4k+1} = i$, $i^{4k+2} = -1$ and $i^{4k+3} = -i$

- (i) Find the value of i^{30} .
- (ii) If $z = i^{-39}$, then find the simplest form of z.

Page 5 of 18

[4]

Solution

Section A

1.

(b) $\tan 37^{\circ}$ Explanation: $\frac{\cos 8^{\circ} - \sin 8^{\circ}}{\cos 8^{\circ} + \sin 8^{\circ}} = \frac{1 - \tan 8^{\circ}}{1 + \tan 8^{\circ}} = \frac{\tan 45^{\circ} - \tan 8^{\circ}}{1 + \tan 45^{\circ} \tan 8^{\circ}} [\because 1 = \tan 45^{\circ}]$ = $\tan (45^{\circ} - 8^{\circ}) = \tan 37^{\circ}$

2.

(c) Domain = $[1, \infty)$, Range = $[0, \infty)$ **Explanation:** We have, $f(x) = \sqrt{x-1}$ Clearly, f(x) is defined if $x - 1 \ge 0$ $\Rightarrow x \ge 1$ \therefore Domain of $f = [1, \infty)$ Now for $x \ge 1, x - 1 \ge 0$ $\Rightarrow \sqrt{x-1} \ge 0$ \Rightarrow Range of $f = [0, \infty)$

3.

(c) 8 and 8

Explanation: Let the observations be x'_i s, i = 1, 2, ..., 10 and the mean and variance of y'_i s are $\overline{x} = 4$ and $\sigma^2 = 2$. Now, let $y_i = 2x'_i$ s and the mean and variance of y'_i s and \overline{y} and σ_1^2 then

$$\bar{y} = \frac{\Sigma 2x_i}{10} = 2\frac{\Sigma 2x_i}{10} = 2\bar{x}$$
 = 8 and $\sigma_1^2 = \operatorname{var}(y_i's) = \operatorname{var}(2x_i's)$
= 4 var $(x_i's) = 4 \times 2 = 8$

Thus, the mean and variance of new series are 8 and 8.

4.

(c) $\frac{-1}{\sqrt{24}}$

Explanation: The equation is in the form of $\frac{0}{0}$

Using L' Hospital rule we have $\frac{\frac{1}{2\sqrt{25-x^2}} \cdot (-2x)}{1}$ Substituting x = 1 we get $\frac{-1}{\sqrt{24}}$

5.

(b) x - 3y + 4 = 0

Explanation: The equation of the sides AB, AC and CA of \triangle ABC are y - x = 2, x + 2y = 1 and 3x + y + 5 = 0, respectively. Solving the equations of AB and BC, i,e, y - x = 2 and x + 2y = 1, we get

x = -1, y = 1

So, the coordinates of B are (-1, 1)

 \therefore Slope of AC = -3

Thus, slope of the altitude through B is $\frac{1}{3}$.

Equation of the required altitude is given below as per the general formula :

 $y - 1 = \frac{1}{3}(x + 1)$

$$\Rightarrow$$
 x - 3y + 4 = 0.

6.

(c) z = 0, x = 0

Explanation: On y-axisis consider as x = 0 and z = 0

7.

(b) $z\bar{z} = |z|^2$ **Explanation:** If z = x + iy then $\bar{Z} = x - iy$ Now $z\bar{z} = (x + iy) \cdot (x - iy) = x^2 + y^2 = |z|^2$ [$\because |z| = \sqrt{x^2 + y^2}$]

Get More Learning Materials Here : 📕

8.

(c) 31 Explanation: ${}^{5}C_{1} + {}^{5}C_{2} + {}^{5}C_{3} + {}^{5}C_{4} + {}^{5}C_{5}$ $= {}^{5}C_{1} + {}^{5}C_{2} + {}^{5}C_{2} + {}^{5}C_{1} + {}^{5}C_{5}$ $= 2 \times {}^{5}C_{1} + 2 \times {}^{5}C_{2} + {}^{5}C_{5}$ $= 2 \times 5 + 2 \times \frac{5!}{2!3!} + 1$ = 10 + 20 + 1= 31.

9. (a)
$$\frac{1}{2}$$

Explanation: Given, $\lim_{x \to 0} \frac{\tan 2x - x}{3x - \sin x} = \lim_{x \to 0} \frac{x \left\lfloor \frac{\tan 2x}{x} - 1 \right\rfloor}{x \left[3 - \frac{\sin x}{x} \right]}$ $\lim_{x \to 0} \frac{\frac{\tan 2x}{2x} \times 2 - 1}{3 - \frac{\sin x}{x}} = \frac{1 \cdot 2 - 1}{3 - 1} = \frac{2 - 1}{2} = \frac{1}{2}$

10.

(c) 5:4 Explanation: $\theta_1 = 60^\circ = \left(60 \times \frac{\pi}{180}\right)^c = \left(\frac{\pi}{3}\right)^c$ and $\theta_2 = 75^\circ = \left(75 \times \frac{\pi}{180}\right)^c = \left(\frac{5\pi}{12}\right)^c$ $\therefore l = r_1 \theta_1 = r_2 \theta_2$ $\Rightarrow r_1 \times \frac{\pi}{3} = r_2 \times \frac{5\pi}{12} \Rightarrow \frac{r_1}{r_2} = \left(\frac{5}{12} \times 3\right) = \frac{5}{4} \Rightarrow r_1 : r_2 = 5 : 4$

11.

(**d**) A

(c) 99

Explanation: Common between set A and $(A \cup B)$ is set A itself

12.

Explanation: We have $(1 + x)^n = 1 + {}^n C_1(x) + {}^n C_2(x)^2 + \dots + (x)^n$ Hence $(\sqrt{2} + 1)^6 = 1 + {}^6C_1(\sqrt{2}) + {}^6C_2(\sqrt{2})^2 + {}^6C_3(\sqrt{2})^3 + {}^6C_4(\sqrt{2})^4 + {}^6C_5(\sqrt{2})^5 + (\sqrt{2})^6$ $\Rightarrow (\sqrt{2} + 1)^6 = 1 + 6(\sqrt{2}) + 15 \times 2 + 20 \times 2(\sqrt{2}) + 15 \times 4 + 6 \times 4(\sqrt{2}) + 8$ $= 99 + 70\sqrt{2}$ Hence integral part of $(\sqrt{2} + 1)^6 = 99$

13. **(a)** x < y

Explanation: Given $x = 99^{50} + 100^{50}$ and $y = (101)^{50}$ Now $y = (101)^{50} = (100 + 1)^{50} = {}^{50}C_0(100)^{50} + {}^{50}C_1(100)^{49} + {}^{50}C_2(100)^{48} + + {}^{50}C_{50}(i)$ Also $(99)^{50} = (100 - 1)^{50} = ={}^{50}C_0(100)^{50} - {}^{50}C_1(100)^{49} + {}^{50}C_2(100)^{48} - + {}^{50}C_{50}(ii)$ Now subtract equation (ii) from equation (i), we get $(101)^{50} - (99)^{50} = 2 [{}^{50}C_1 (100)^{49} + {}^{50}C_3 (100)^{47} + ...]$ $= 2 [50(100)^{49} + \frac{50 \times 49 \times 48}{3 \times 2 \times 1} (100)^{47} + ...]$ $= (100)^{50} + 2 (\frac{50 \times 49 \times 48}{3 \times 2 \times 1} (100)^{47})$ $\Rightarrow (101)^{50} - (99)^{50} > (100)^{50}$ $\Rightarrow (101)^{50} > (100)^{50} + (99)^{50}$ $\Rightarrow y > x$ (b) $x \in (-\infty, -a) \cup (a, \infty)$ Explanation: |x| > a

15.

 \Rightarrow x < -a or x > a

 \Rightarrow x \in ($-\infty$, -a) \cup (a, ∞)

14.

(c) $R = \{(x, y) : 0 < x < a, 0 < y < b\}$ Explanation: We have, R be set of points inside a rectangle of sides a and b Since, a, b > 1

Page 7 of 18

Get More Learning Materials Here : **_**

a and b cannot be equal to 0 Thus, $R = \{(x, y) : 0 < x < a, 0 < y < b\}$ 16. (a) 1 **Explanation:** $\pi = 180^{\circ}$ Using $\tan(180 - A) = -\tan A$, we get; $C = \pi - (A + B)$ Now, $\tan A{+}{\tan B}{+}{\tan C}$ $\frac{\tan A \tan B \tan C}{\tan A + \tan B + \tan[\pi - (A+B)]}$ $\tan A \tan B \tan[\pi - (A+B)]$ $\tan A + \tan B - \tan(A+B)$ $-\tan A \tan B \tan(A+B)$ $\tan A + \tan B - \frac{\tan A + \tan B}{1 - \tan A \tan B}$ $\overline{-\tan A \tan B \times \frac{\tan A + \tan B}{1 - \tan A \tan B}}$ $\tan A + \tan B - \tan^2 A \tan B - \tan A \tan^2 B - \tan A - \tan B$ $-\tan^2 A \tan B - \tan A \tan^2 B$ $-\tan^2 A \tan B - \tan A \tan^2 B$ $-\tan^2 A \tan B - \tan A \tan^2 B$ = 1

17.

(d) 2 Explanation: Let $x - \frac{\pi}{4} = t$ $\Rightarrow \lim_{t \to 0} \frac{\tan(\frac{\pi}{4} + t) - 1}{t}$ $\Rightarrow \lim_{t \to 0} \frac{2 \tan t}{(1 - \tan t)(t)}$ = 2

18.

(d) 5 Explanation: Given ${}^{10}P_r = 2.^9 P_r$ $\Rightarrow \frac{10!}{(10-r)!} = 2 \cdot \frac{(9)!}{(9-r)!}$ $\Rightarrow \frac{10 \times 9!}{(10-r) \times (9-r)!} = 2 \cdot \frac{(9)!}{(9-r)!}$ $\Rightarrow \frac{10}{(10-r)} = 2$ $\Rightarrow 10 = 20 - 2r$ $\Rightarrow 2r = 10$ $\Rightarrow r = 5$

19. (a) Both A and R are true and R is the correct explanation of A.Explanation: Both A and R are true and R is the correct explanation of A.

20.

(b) Both A and R are true but R is not the correct explanation of A. **Explanation:** Both A and R are true but R is not the correct explanation of A.

Section B

21. Here we are given that , A and B are two non-empty sets such that n(A) = 5, n(B) = 6 and = 3

i. $n(A \times B) = n(A) \times n(B) = (5 \times 6) = 30$

ii. $n(B \times A) = n(B) \times n(A) = (6 \times 5) = 30$

iii. Given: $n(A \cap B) = 3$

: A and B have 3 elements in common

So, $(A \times B)$ and $(B \times A)$ have $3^2 = 9$ elements in common. Hence, $n\{(A \times B) \cap (B \times A)\} = 9$

OR

CLICK HERE

(>>

We know that two ordered pairs are equal if their corresponding elements are equal.

i. $(2a - 5, 4) = (5, b + 6) \Rightarrow 2a - 5 = 5$ and 4 = b + 6 [equating corresponding elements] $\Rightarrow 2a = 5 + 5$ and 4 - 6 = b

Page 8 of 18

Get More Learning Materials Here : 📕

$$\Rightarrow 2a = 10 \text{ and } -2 = b \Rightarrow a = 5 \text{ and } b = -2$$

ii. $(a - 3, b + 7) = (3, 7) \Rightarrow a - 3 = 3 \text{ and } b + 7 = 7$ [equating corresponding elements]
 $\Rightarrow a = 3 + 3 \text{ and } b = 7 - 7 \Rightarrow a = 6 \text{ and } b = 0$

22. We have:
$$\lim_{x \to 0} \left[\frac{\sin^2 4x^2}{x^4} \right]$$
$$= \lim_{x \to 0} \left[\frac{\sin(4x^2)}{x^2} \times \frac{\sin(4x^2)}{x^2} \right]$$
$$= \lim_{x \to 0} \left[\frac{\sin(4x^2)}{4x^2} \times 4 \times \frac{\sin(4x^2)}{4x^2} \times 4 \right]$$
$$= 4 \times 4 \left[\because \lim_{x \to 0} \frac{\sin x}{x} = 1 \right]$$
$$= 16$$

23. We know that,

If odds in favour of the occurrence an event are a: b, then the probability of an event to occur is $\frac{a}{a+b}$,

similarly, if odds are <u>not</u> in the favor of the occurrence an event are a: b, then the probability of <u>not</u> occurrence of the event is $\frac{a}{a+b}$ that is the probability of not occurring = $\frac{a}{a+b}$

We also know that,

Probability of occurring = 1 - the probability of not occurring

 $=1-\frac{a}{a+b}$ $=\frac{b}{a+b}$ Given a = 4 and b = 7 Probability of occurrence = $\frac{7}{4+7}$ $=\frac{7}{11}$

OR

We have to find the probability that all the three balls are blue balls

Given: bag which contains 8 red, 3 white, 9 blue balls Formula: $P(E) = \frac{favourable outcomes}{total possible outcomes}$

three balls are drawn at random therefore

Total possible outcomes of selecting two persons is ${}^{20}C_3$

Therefore $n(S) = {}^{20}C_3 = 1140$

let E be the event that all the balls are blue

 $E = \{B, B, B\}$

 $n(E) = {}^{9}C_{3} = 84$ $P(E) = rac{n(E)}{n(S)}$ $P(E) = rac{84}{1140} = rac{7}{95}$

24. We can write, $(A \cap B) \cup (A - B) = (A \cap B) \cup (A \cap B')$

= $X \cup (A \cap B')$, where $X = A \cap B$

 $= (X \cup A) \cap (X \cup B')$

 $= A \cap (A \cup B') [:: X \cup A = (A \cap B) \cup A = A] [:: A \cap B \subset A]$

 $= X \cup B' = (A \cap B) \cup B'$

 \Rightarrow (A \cup B') \cap (B \cup B')

 \Rightarrow (A \cup B') \cap U = A \cup B'

 $= A [:: A \subset A \cup B']$

25. Let m be the slope of the required line.

Since the required line is perpendicular to the line joining A (2, -3) and B (4, 2).

 $\therefore \mathbf{m} \times \text{Slope of AB} = -1 \Rightarrow \mathbf{m} \times \frac{2+3}{4-2} = -1 \Rightarrow \mathbf{m} = -\frac{2}{5}$

The required line cuts off an intercept of length 4 on y-axis. So, c = 4

Substituting these values in y = mx + c, we obtain that the equation of the required line is

$$y = -\frac{2}{5}x + 4$$

or, 2x + 5y - 20 = 0

which is the required equation of line.

26. Given: Six persons are to be arranged in a row.

Assume six seats, now in the first seat, any one of six members can be seated, so the total number of possibilities is ${}^{6}C_{1}$ Similarly, in the second seat, any one of five members can be seated, so the total number of possibilities is ${}^{5}C_{1}$ In the third seat, any one of four members can be seated, so the total number of possibilities is ${}^{4}C_{1}$ In the fourth seat, any one of three members can be seated, so the total number of possibilities is ${}^{3}C_{1}$ In the fifth seat, any one of two members can be seated, so the total number of possibilities is ${}^{2}C_{1}$ In the fifth seat, any one of two members can be seated, so the total number of possibilities is ${}^{2}C_{1}$ In the sixth seat, only one remaining person can be seated, so the total number of possibilities is ${}^{1}C_{1}$ Hence the total number of possible outcomes = ${}^{6}C_{1} \times {}^{5}C_{1} \times {}^{4}C_{1} \times {}^{3}C_{1} \times {}^{2}C_{1} \times {}^{1}C_{1} = 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 720$ 27. Let A (-1, 2, 1), B(1, -2, 5), C(4, -7, 8) and D (2, -3, 4) are the vertices of a quadrilateral ABCD.

Then, mid-point of $AC = \left(\frac{-1+4}{2}, \frac{2-7}{2}, \frac{1+8}{2}\right) = \left(\frac{3}{2}, \frac{-5}{2}, \frac{9}{2}\right) \left[\because \text{ coordinates of mid-point}\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}, \frac{z_1+z_2}{2}\right)\right]$ Similarly, mid-point of BD = $\left(\frac{3}{2}, -\frac{5}{2}, \frac{9}{2}\right)$ Mid-points of both the diagonals are the same (i.e., they bisect each other). Hence, ABCD is a parallelogram. 28. To find: Expansion of $\left(\frac{2x}{3} - \frac{3}{2x}\right)^6$ by means of binomial theorem Formula used: ${}^{n}C_{r} = \frac{n!}{(n-r)!(r)!}$ $(a+b)^n = {}^n C_0 a^n + {}^n C_1 a^{n-1} b + {}^n C_2 a^{n-2} b^2 + \dots + {}^n C_{n-1} a b^{n-1} + n C_n b^n$ Now here We have, $\left(\frac{2x}{3} - \frac{3}{2x}\right)^6$ $2 = \left\lceil 6c_0 \left(rac{2x}{3}
ight)^{6-0}
ight
ceil + \left\lceil 6c_1 \left(rac{2x}{3}
ight)^{6-1} \left(-rac{3}{2x}

$$= 2[{}^{5}C_{1}a^{4} + {}^{5}C_{3}a^{2} + {}^{5}C_{5}]$$

$$= 2\left[\left(\frac{5!}{11(5-1)!}a^{4}\right) + \left(\frac{5!}{3!(5-3)!}a^{2}\right) + \left(\frac{5!}{5!(5-5)!}\right)\right]$$

$$= 2[(5)a^{4} + (10)a^{2} + (1)]$$

$$= 2[5a^{4} + 10a^{2} + 1] = (a+1)^{5} - (a-1)^{5}$$
Putting the value of a, $= \sqrt{3}$ in the above equation we get..
 $(\sqrt{3} + 1)^{5} - (\sqrt{3} - 1)^{5} = 2\left[5(\sqrt{3})^{4} + 10(\sqrt{3})^{2} + 1\right]$

$$= 2[(5)(9) + (10)(3) + 1]$$

$$= 2[45 + 30 + 1]$$

$$= 152$$

29. We need to find the derivative of $f(x) = (x^2 + 1)(x - 5)$ Derivative of a function f(x) from first principle is given by $f'(x) = \lim_{h \to 0} = \frac{f(x+h) - f(x)}{h}$ {where h is a very small positive number} \therefore derivative of $f(x) = (x^2 + 1)(x - 5)$ is given as $f'(x) = \lim_{h \to 0} = \frac{f(x+h) - f(x)}{h}$ $\Rightarrow f'(x) = \lim_{h \to 0} \frac{\{(x+h)^2 + 1\}(x+h-5) - (x^2+1)(x-5)}{h}$ $\Rightarrow f'(x) = \lim_{h \to 0} \frac{\{(x+h)^3 + x+h - 5(x+h)^2 - 5\} - (x^3 - 5x^2 + x - 5)}{h}$ Using $(a + b)^2 = a^2 + 2ab + b^2$ and $(a + b)^3 = a^3 + 3ab(a + b) + b^3$ we have: $\Rightarrow f'(x) = \lim_{h \to 0} \frac{\{x^3 + 3x^2 + h^3 + x+h - 5x^2 - 10hx - 5h^2 - 5\} - (x^3 - 5x^2 + x - 5)}{h}$ $\Rightarrow f'(x) = \lim_{h \to 0} \frac{\{3x^2 + 3h^2 x + h^3 + h - 10hx - 5h^2\}}{h}$ $\Rightarrow f'(x) = \lim_{h \to 0} \frac{h\{3x^2 + 3hx + h^2 + 1 - 10x - 5h\}}{h}$ $\Rightarrow f'(x) = \lim_{h \to 0} \{3x^2 + 3(0)x + 0^2 + 1 - 10x - 5(0)$ $\Rightarrow f'(x) = 3x^2 - 10x + 1$

OR Here $f(x) = \frac{x+1}{x-1}$ Then $f(x+h) = \frac{x+h+1}{x+h-1}$ We know that $f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$ $\Rightarrow f'(x) = \lim_{h \to 0} \frac{\frac{x+h+1}{x+h-1} - \frac{x+1}{x-1}}{h}$ $= \lim_{h \to 0} \frac{(x+h+1)(x-1) - (x+1)(x+h-1)}{h(x+h-1)(x-1)}$ $= \lim_{h \to 0} \frac{x^2 + x + x h - h + x - 1 - x^2 - x h + x - x - h + 1}{h(x+h-1)(x-1)}$ $= \lim_{h \to 0} \frac{x^2 + x + x h - h + x - 1 - x^2 - x h + x - x - h + 1}{h(x+h-1)(x-1)}$ $= \lim_{h \to 0} \frac{x^2 + x + x h - h + x - 1 - x^2 - x h + x - x - h + 1}{h(x+h-1)(x-1)}$ $= \lim_{h \to 0} \frac{-2h}{h(x+h-1)(x-1)} = \frac{-2}{(x-1)^2}$ 30. Let a and b be the roots of required quadratic equation. Then A.M. $= \frac{a+b}{2} = 8$ \Rightarrow a + b = 16And G.M. $= \sqrt{ab} = 5$ $\Rightarrow ab = 25$ Now, Quadratic equation x^2 - (Sum of roots) x + (Product of roots) = 0 $\Rightarrow x^2 - (a + b)x + ab = 0$ $\Rightarrow x^2 - 16x + 25 = 0$ Therefore, required equation is $x^2 - 16x + 25 = 0$

Page 11 of 18

OR

Let us take a G.P. whose first is a and common difference is r.

 $\therefore S_{\infty} = rac{a}{1-r}$ $\Rightarrow \frac{a}{1-r} = 3 \dots (i)$ And, sum of the terms of the G.P. a^2 , $(ar)^2$, $(ar^2)^2$, ... ∞ $egin{array}{lll} S_{\infty}=rac{a^2}{1-r^2}\ \Rightarrowrac{a^2}{1-r^2}=rac{9}{2} \ ...(ext{ii}) \end{array}$ $\Rightarrow 2a^2 = 9(1 - r^2)$ $\Rightarrow 2[3(1 - r)]^2 = 9 - 9r^2$ [From (i)] \Rightarrow 18(1 + r² - 2r) = 9 - 9r² \Rightarrow 18 - 9 + 18r² + 9r² - 36r = 0 $\Rightarrow 27r^2 - 36r + 9 = 0$ $\Rightarrow 3(9r^2 - 12r + 3) = 0$ \Rightarrow 9r² - 12r + 3 = 0 \Rightarrow 9r² - 9r - 3r + 3 = 0 \Rightarrow 9r(r - 1) -3(r - 1) = 0 \Rightarrow (9r - 3)(r - 1) = 0 $\Rightarrow r = rac{1}{3}$ and r = 1 But, r = 1 is not possible. $\therefore r = \frac{1}{3}$ Now, substituting $r = \frac{1}{3}$ in $\frac{a}{1-r} = 3$ $a = 3\left(1 - \frac{1}{3}\right)$ $\Rightarrow a = 3 \times \frac{2}{3} = 2$ Therefore the first term is 2 and common difference is $\frac{1}{2}$ 31. Given that, n(T) = 12n(C) = 15 $n(T \cap C) = 7$ i. $n(T \cup C) = n(T) + n(C) - n(T \cap C)$ = 12 + 15 - 7 $n(T \cup C) = 20$ 20 members like at least one of the two drinks. ii. Only tea but not coffee $= n(T) - n(T \cap C)$ = 12 - 7 = 5 iii. Only coffee but not tea $= n(C) - n(T \cap C)$ = 15 - 7 = 8 iv. Neither tea nor coffee $= n(U) - n(T \cup C)$ = 25 - 20 = 5

Section D

32. Given: set of first n natural numbers when n is an even number.

To find: the mean deviation about the mean We know first n natural numbers are 1, 2, 3 ..., n. And given n is even number. So mean is,

 $\bar{\mathbf{x}} = \frac{1+2+3+\dots+n}{n} = \frac{\frac{n(n+1)}{2}}{n} = \frac{(n+1)}{2}$

Page 12 of 18

CLICK HERE

Get More Learning Materials Here : 📕

🕀 www.studentbro.in

The deviations of numbers from the mean are as shown below,

$$\begin{split} &1 - \frac{(n+1)}{2}, 2 - \frac{(n+1)}{2}, 3 - \frac{(n+1)}{2}, ..., \frac{(n-2)}{2} - \frac{(n+1)}{2}, \frac{(n)}{2} - \frac{(n+1)}{2}, \frac{(n+2)}{2} - \frac{(n+1)}{2}, ..., n - \\ ⩔, \\ &\frac{2 - (n+1)}{2}, \frac{4 - (n+1)}{2}, \frac{6 - (n+1)}{2}, ..., \frac{n-2 - (n+1)}{2}, \frac{n - (n+1)}{2}, \frac{(n+2) - (n+1)}{2}, ..., \frac{2n - (n+1)}{2} \\ &\frac{2 - (n+1)}{2}, \frac{4 - (n+1)^2}{2}, \frac{6 - (n+1)}{2}, ..., \frac{n-3}{2}, \frac{-1}{2}, \frac{1}{2}, \frac{1}{2}, ..., \frac{2n - (n+1)}{2} \\ ⩔, \\ &\frac{1 - n}{2}, \frac{3 - n}{2}, \frac{5 - n}{2}, ..., \frac{-3}{2}, \frac{-1}{2}, \frac{-1}{2}, ..., \frac{n-1}{2} \\ &So the absolute values of deviation from the mean is \\ &|x_i - \overline{x}| = \frac{(n-1)}{2}, \frac{(n-3)}{2}, \frac{(n-5)}{2}, ..., \frac{3}{2}, \frac{1}{2}, \frac{1}{2}, ..., \frac{n-1}{2} \\ &The sum of absolute values of deviations from the mean, is \\ &\Sigma |x_i - \overline{x}| = \frac{(n-1)}{2} + \frac{(n-3)}{2} + \frac{(n-5)}{2} + ... + \frac{3}{2} + \frac{1}{2} + \frac{1}{2} + ... + \frac{n-1}{2} \\ &\sum |x_i - \overline{x}| = \left(\frac{1}{2} + \frac{3}{2} + ... + \frac{(n-1)}{2}\right) \left(\frac{n}{2}\right) \end{split}$$

Now we know sum of first n natural numbers = n^2

Therefore, mean deviation about the mean is

$$\mathbf{M} \cdot \mathbf{D} = \frac{\sum |\mathbf{x}_{i} - \bar{\mathbf{x}}|}{\mathbf{n}} = \frac{\left(\frac{1}{2} + \frac{3}{2} + \dots + \frac{(n-1)}{2}\right) \left(\frac{n}{2}\right)}{\mathbf{n}}$$
$$M \cdot D = \frac{\sum |\mathbf{x}_{i} - \bar{\mathbf{x}}|}{\mathbf{n}} = \frac{\left(\frac{n}{2}\right)^{2}}{\mathbf{n}}$$
$$\mathbf{M} \cdot \mathbf{D} = \frac{\sum |\mathbf{x}_{i} - \bar{\mathbf{x}}|}{\mathbf{n}} = \frac{\mathbf{n}^{2}}{4\mathbf{n}} = \frac{\mathbf{n}}{4}$$

33. Here the given equation are;

$$y = x^{2} - 2x + 3$$

$$\Rightarrow x^{2} - 2x = y - 3$$

$$\Rightarrow x^{2} - 2x + 1 = y - 3 + 1$$

$$\Rightarrow (x - 1)^{2} = y - 2 \quad \dots (i)$$

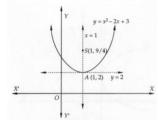

Now, shifting the origin to the point (1, 2) without rotating the axes and denoting new coordinates with respect to these axes by X and Y, we get,

(n+1)

x = X + 1, y = Y + 2 (ii)

Using these relations, equation (i) reduces to

 $X^2 = Y$ (iii)

This is of the form $X^2 = 4aY$

Comparing, we get,

4a = 1 i,e, a = 1/4

Vertex: Coordinates of the vertex with respect to the new axes are (X = 0, Y = 0).

So, the coordinates of the vertex with respect to the old axes are (1, 2) [Put X = 0, Y = 0 in (ii)]

Axis: The equation of the axis of the parabola with respect to the new axes is X = 0

So, the equation of the axis with respect to the old axes is x = 1 [Put X = 0 in (ii)]

Focus: The coordinates of the focus with respect to the new axes are (X = 0, Y = a) i.e.

$$(X = 0, Y = 1/4)$$

So, the coordinates of the focus S with respect to the old axes are

(1, 9/4) [Put X = 0, Y = $\frac{1}{4}$ in (ii)]

Directrix: The equation of the directrix with respect to the new axes is Y = -a i.e. Y = -1/4

So, the equation of the directrix with respect to the old axes is

 $y = -\frac{1}{4} + 2 \text{ or } y = \frac{7}{4}$ [Put $Y = -\frac{1}{4}$ in (ii)]

Latus-rectum: Length of the latus-rectum of given parabola is 4a = 1

Page 13 of 18

Get More Learning Materials Here :

The equation of the ellipse is

 $25x^{2} + 9y^{2} - 150x - 90y + 225 = 0$ $\Rightarrow 25x^{2} - 150x + 9y^{2} - 90y = -225$ $\Rightarrow 25 (x^{2} - 6x) + 9 (y^{2} - 10y) = -225$ $\Rightarrow 25(x^{2} - 6x + 9) + (y^{2} - 10y + 25) = -225 + 225 + 225$ $\Rightarrow 25 (x - 3)^{2} + 9 (y - 5)^{2} = 225$ $\Rightarrow \frac{(x - 3)^{2}}{9} + \frac{(y - 5)^{2}}{25} = 1 \dots (i)$

Shifting the origin at (3, 5) without rotating the coordinate axes and denoting the new coordinates with respect to the new axes by X and Y, we have .. (ii)

x = X + 3 and y = Y + 5 Using these relations, equation (i) reduces to $\frac{X^2}{3^2} + \frac{Y^2}{5^2} = 1 \dots (iii)$

Comparing equation (iii) with standard form $rac{x^2}{a^2}+rac{y^2}{b^2}=1$, we get

 $a^2 = 32$ and $b^2 = 52$. $\Rightarrow a = 4\sqrt{2}$ and $b = \sqrt{52}$

Clearly, a < b. So, equation (iii) represents an ellipse whose major and minor axes along Y and X axes respectively.

$$e = \sqrt{1 - \frac{a^2}{b^2}} = \sqrt{1 - \frac{9}{25}} = \frac{4}{5}$$

Centre:

The coordinates of the centre with respect to new axes are (X = 0, Y = 0).

So, the coordinates of the centre with respect to old axes are (3, 5).

Vertices:

The vertices of the ellipse with respect to the new axes are (X = 0, Y = \pm b) i.e. (X = 0, Y = \pm 5). So, the vertices with respect to the old axes are

(3, 5 \pm 5) i.e. (3, 0) and (3, 10) [Putting X = 0, Y = \pm 5 in (ii)] Foci:

The coordinates of the foci with respect to the old axes are (X = 0, Y = \pm be) i.e. (X = 0, Y = \pm 4). So, the coordinates of the foci with respect to the old axes are

 $(3, \pm 4 + 5)$ i.e. (3, 1) and (3, 9) [Putting X = 0,Y = ± 4 in (ii)]

The equations of the directrices with respect to the new axes are $Y = \pm \frac{b}{e}$ i.e. $Y = \pm \frac{25}{4}$

So, the equations of the directrices with respect to the old axes are

$$y = \pm \frac{25}{4} + 5$$
 i.e. $y = -\frac{5}{4}$ and $y = \frac{45}{4}$ [Putting $Y = \pm \frac{25}{4}$ in (ii)]

Axes:

Lengths of the major axis = 2b - 10,

Lengths of the Minor axis = 2a = 6.

Equation of the major axis with respect to the new axes is X = 0. So, the equation of the major axis with respect to the old axes is x = 3. [Putting X = 0 in (ii)]

The equation of the minor axis with respect to the new axes is Y = 0. So, the equation of the minor axis with respect to the old axes is y = 5. [Putting Y = 0 in (ii)]

Latus-rectum: The length of the latus-rectum $= \frac{2a^2}{b} = \frac{2 \times 9}{5} = \frac{18}{5}$

The equations of the latus-rectum with respect to the new axes are $Y = \pm$ ae i.e. $y = + Y \pm 4$. So, the equations of the latus-rectum with respect to the old axes are

 $y = \pm 4 + 5$ i.e. y = 1 and y = 9. [Putting $Y = \pm 4$ in (ii)]

34. The given system of linear inequalities is

 $-2 - \frac{x}{4} \ge \frac{1+x}{3}$... (i) and 3 - x < 4 (x - 3) ... (ii) From inequality (i), we get $-2 - \frac{x}{4} \ge \frac{1+x}{2}$

 \Rightarrow - 24 - 3x \geq 4 + 4x [multiplying both sides by 12]

 \Rightarrow - 24 - 3x - 4 \ge 4 + 4x - 4 [subtracting 4 from both sides]

 \Rightarrow - 28 - 3x \ge 4x

 \Rightarrow - 28 - 3x + 3x \ge 4x + 3x [adding 3x on both sides]

 \Rightarrow - 28 \geq 7x

 $\Rightarrow -\frac{28}{7} \ge \frac{7x}{7}$ [dividing both sides by 7]

 \Rightarrow - 4 \geq x or x \leq - 4 ... (iii)

Thus, any value of x less than or equal to - 4 satisfied the inequality.

So, solution set is $x\in(-\infty,-4]$

$$-\infty \xrightarrow{x \leq -4} 0$$

From inequality (ii), we get

3 - x < 4 (x - 3)

 \Rightarrow 3 - x < 4x - 12

 \Rightarrow 3 - x + 12 < 4x - 12 + 12 [adding 12 on both sides]

 \Rightarrow 15 - x < 4x

 \Rightarrow 15 - x + x < 4x + x [adding x on both sides]

 $\Rightarrow 15 < 5x$

 \Rightarrow 3 < x [dividing both sides by 3]

or
$$x > 3 ... (iv)$$

Thus, any value of x greater than 3 satisfies the inequality.

So, the solution set is $x\in(3,\infty)$

The solution set of inequalities (i) and (ii) are represented graphically on number line as given below:

$$\xrightarrow{x \leq -4} \xrightarrow{x > 3} \\ \xrightarrow{-\infty} \xrightarrow{-4} 0 3$$

As no region is common, hence the given system has no solution.

35. LHS = tan
$$(\alpha - \beta) = \frac{\sin 2\beta}{5 - \cos 2\beta}$$

$$= \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$$

$$= \frac{\frac{3}{2} \tan \beta - \tan \beta}{1 + \frac{3}{2} \tan \beta \tan \beta} \dots [\because 2 \tan \alpha = 3 \tan \beta \Rightarrow \tan \alpha = \frac{3}{2} \tan \alpha]$$

$$= \frac{\tan \beta \left(\frac{3}{2} - 1\right)}{1 + \frac{3}{2} \tan^2 \beta}$$

$$= \frac{\frac{1}{2} \tan \beta}{1 + \frac{3}{2} \tan^2 \beta}$$

$$= \frac{\frac{1}{2} \tan^2 \beta}{1 + \frac{3}{2} \cos \beta} \dots [\because \tan \beta = \frac{\sin \beta}{\cos \beta}]$$

$$= \frac{\frac{\sin \beta}{2 \cos \beta}}{1 + \frac{3 \sin^2 \beta}{2 \cos \beta}}$$

$$= \frac{\frac{\sin \beta}{2 \cos \beta}}{\frac{2 \cos^2 \beta + 3 \sin^2 \beta}{2 \cos \beta (2 \cos^2 \beta + 3 \sin^2 \beta)}}$$

$$= \frac{2 \cos \beta \sin \beta}{2 (2 \cos^2 \beta + 3 \sin^2 \beta)}$$

$$= \frac{\sin 2\beta}{2 (2 \cos^2 \beta + 3 \sin^2 \beta)} \dots {\because \sin 2x = 2(\sin x)(\cos x)}$$

Method to Find the Sets When Cartesian Product is Given

For finding these two sets, we write first element of each ordered pair in first set say A and corresponding second element in second set B (say).

Number of Elements in Cartesian Product of Two Sets

If there are p elements in set A and q elements in set B, then there will be pq elements in $A \times B$ i.e. if n(A) = p and n(B) = q, then $n(A \times B) = pq$.

(i)
$$n(A \times A) = 9$$

 $\Rightarrow n(A) \subset n(A) = 9 \Rightarrow n(A) = 3$
 $(-1,0) \in A \times A \Rightarrow -1 \in A, 0 \in A$
 $(0,1) \in A \times A \Rightarrow 0 \in A, 1 \in A$
 $\Rightarrow -1, 0, 1 \in A$
Also, $n(A) = 3 \Rightarrow A = (-1, 0, 1)$
Hence, $A = \{-1, 0, 1\}$
Also, $A \times A = \{-1, 0, 1\} \times \{-1, 0, 1\}$
 $= \{(-1, -1), (-1, 0), (-1, 1), (0, -1), (0, 0), (0, 1), (1, -1), (1, 0), (1, 1)\}$
Hence, the remaining elements of $A \times A$ are
 $(-1, -1), (-1, 1), (0, -1), (0, 0), (1, -1), (1, 0)$ and $(1, 1)$.

(ii) Given, $(A \times B) = 6$ and $(A \times B) = \{(1, 3), (2, 5), (3, 3)\}$

We know that Cartesian product of set A = {a, b} & B = {c, d} is A \times B = {(a, c), (a, d), (b, c), (b, d)} Therefore, A = {1, 2, 3} & B = {3, 5}

 $\Rightarrow A \times B = \{(1, 3), (1, 5), (2, 3), (2, 5), (3, 3), (3, 5)\}$

Thus, remaining elements are A \times B = {(1, 5), (2, 3), (3, 5)}

(iii)If the set A has 3 elements and set B has 4 elements, then the number of elements in A imes B = 12

OR

Clearly, A is the set of all first entries in ordered pairs in A \times B and B is the set of all second entries in ordered pairs in A \times B

 \therefore A = {a, b} and B = {1, 2, 3}

37. Read the text carefully and answer the questions:

Four friends Dinesh, Yuvraj, Sonu, and Rajeev are playing cards. Dinesh, shuffling a cards and told to Rajeev choose any four cards.

(i) Total number of possible outcomes = ${}^{52}C_4$ We know that there are 12 face cards

$$\therefore$$
 Number of favourable outcomes = ${}^{12}C_{4}$

- \therefore Required probability = $\frac{{}^{12}C_4}{{}^{52}C_4}$
- (ii) Total number of possible outcomes = ${}^{52}C_4$

We know that there are 26 red and 26 black cards.

- \therefore Number of favourable outcomes = ${}^{26}C_2 \times {}^{26}C_2$
- \therefore Required probability = $\frac{({}^{26}C_2)^2}{{}^{52}C_4}$

(iii)Total number of possible outcomes = ${}^{52}C_4$

 \therefore Number of favourable outcomes = $({}^{13}C_1)^4$

- \therefore Required probability = $\frac{(13)^4}{52C_4}$
- 52

OR

Total number of possible outcomes = ${}^{52}C_4$

In playing cards there are 4 king and 4 jack cards.

 \therefore Number of favourable outcomes = $({}^4C_2 \times {}^4C_2)$

$$= 6 \times 6 = 36$$

 \therefore Required probability = $\frac{36}{5^2C_4}$

38. Read the text carefully and answer the questions:

We have, i = $\sqrt{-1}$. So, we can write the higher powers of i as follows

i.
$$i^2 = -1$$

ii. $i^3 = i^2 \cdot i = (-1) \cdot i = -i$
iii. $i^4 = (i^2)^2 = (-1)^2 = 1$
iv. $i^5 = i^{4+1} = i^4 \cdot i = 1 \cdot i = i$
v. $i^6 = i^{4+2} = i^4 \cdot i^2 = 1 \cdot i^2 = -1...$

In order to compute i^n for n > 4, write

 i^n = i^{4q+r} for some q, $r\in N$ and $0\leq r\leq 3.$ Then, i^n = $i^{4q}\cdot i^r$ =($i^4)^q\cdot i^r$ = (1)^q\cdot i^r = i^r
