Skysails is the genre of engineering science that uses extensive utilization of wind energy to move a vessel in the seawater. The 'Skysails' technology allows the towing kite to gain a height of anything between 100 metres - 300 metres. The sailing kite is made in such a way that it can be raised to its proper elevation and then brought back with the help of a 'telescopic mast' that enables the kite to be raised properly and effectively. # Solution

## Section A

#### 1.

(d) composite number

**Explanation:** We have  $7 \times 11 \times 13 + 13 = 13 (77 + 1) = 13 \times 78$ . Since the given number has 2 more factors other than 1 and itself, therefore it is a composite number.

# 2. **(b)** 0

Explanation: There is no zero as the graph does not intersect the x-axis at any point.

## 3. (a) no solution

**Explanation:** Since, we have y = 0 and y = -6 are two parallel lines. therefore, no solution exists.

# 4.

(d) k < 16 Explanation: D > 0  $b^2 - 4ac > 0$  $(-8)^2 - 4(1)(k) > 0$ 64 - 4k > 064 > 4k $(\frac{64}{4}) > k$ 

#### 5.

16 > k

(d) d = 2a Explanation: Given AP in which First term = a Common difference = d Number of terms = n Given  $S_n$  denotes the sum of n terms So  $S_{kx} = (kx/2)\{2a + (kx-1)d\}$ 

# and $S_x = (x/2)\{2a + (x-1)d\}$

Now

$$\begin{split} S_{X} / S_{kx} &= \frac{(\frac{x}{2})[2a + (x-1)d]}{(\frac{kx}{2})[2a + (kx-1)d]} \\ &= \frac{[2a + (x-1)d]}{k[2a + (kx-1)d]} \\ &= \frac{[2a + xd - d]}{k[2a + kxd - d]} \\ &= \frac{[(2a - d) + xd]}{k[(2a - d) + kxd]]} \end{split}$$
 If d = 2a then

 $S_x / S_{kx} = [(2a - 2a) + x \times 2a] / [k \times \{(2a - 2a) + k \times x \times 2a\}]$  $= (x \times 2a) / (k^2 \times x \times 2a)$  $= 1/k^2$ 

6.

#### (b) None of these

**Explanation:** Let the points (0, 0),  $(3, \sqrt{3})$  and  $(3, \lambda)$  from an equilateral triangle AB = BC = CA

Get More Learning Materials Here : 📕

$$\Rightarrow AB^{2} = BC^{2} = CA^{2}$$
Now,  $AB^{2} = (x_{2} - x_{1})^{2} + (y_{2} - y_{1})^{2}$ 

$$= (3 - 0)^{2} + (\sqrt{3} - 0)^{2} = (3)^{2} + (\sqrt{3})^{2}$$

$$= 9 + 3 = 12$$
BC<sup>2</sup> =  $(3 - 3)^{2} + (\lambda - \sqrt{3})^{2}$ 

$$= (0)^{2} + (\lambda - \sqrt{3})^{2} = (\lambda - 3)^{2}$$
and  $CA^{2} = (0 - 3)^{2} + (0 - \lambda)^{2} = (-3)^{2} + (-\lambda)^{2}$ 

$$= 9 + \lambda^{2}$$

$$AB^{2} = CA^{2} \Rightarrow 12 = 9 + \lambda^{2}$$

$$\Rightarrow \lambda^{2} = 12 - 9 = 3$$

$$\therefore \lambda = \pm \sqrt{3}$$

7.

**(c)** (1, -1)

**Explanation:** Let the coordinates of midpoint C(x, y) of the line segment joining the points A(-2, 3) and B(4, -5)  $\therefore x = \frac{x_1+x_2}{2} = \frac{-2+4}{2} = \frac{2}{2} = 1$ And  $y = \frac{y_1+y_2}{2} = \frac{3-5}{2} = \frac{-2}{2} = -1$ Therefore, the coordinates of mid-point C are (1, -1)

8.

(b) 2 Explanation: In  $\triangle ABC$ , DE || BC  $\therefore \frac{AD}{DB} = \frac{AE}{EC}$   $\Rightarrow \frac{x+3}{3x+19} = \frac{x}{3x+4}$   $\Rightarrow (x + 3) (3x + 4) = x (3x + 19)$   $\Rightarrow 3x^2 + 4x + 9x + 12 = 3x^2 + 19x$   $\Rightarrow 3x^2 + 13x + 12 = 3x^2 + 19x$   $\Rightarrow 12 = 3x^2 + 19x - 3x^2 - 13x$   $\Rightarrow 12 = 6x \Rightarrow x = \frac{12}{6} = 2$  $\therefore x = 2$ 

9. **(a)** 44 cm

**Explanation:** Since tangents from an external point to a circle are equal in length.

 $\therefore AS = AP = 6 \text{ cm and } AB = 6 + 7 = 13 \text{ cm}$  PB = BQ = 7 cm and BC = 7 + 5 = 12 cm CQ = CR = 5 cm and CD = 5 + 4 = 9 cm RD = SD = 4 cm and AD = 4 + 6 = 10 cmTherefore, perimeter of quadrilateral ABCD = 13 + 12 + 9 + 10 = 44 \text{ cm}

10.

**(d)** 3 cm

**Explanation:** A quadrilateral ABCD is circumscribed to a circle with centre O. AB = 6 cm, BC = 7 cm, CD = 4 cm, AD = 7 cm rs-aggarwal-class-10-solutions-chapter-12-circles-mcqs-44 ABCD circumscribed to a circle. AB + CD = BC + AD  $\Rightarrow$  6 + 4 = 7 + AD  $\Rightarrow$  10 = 7 + AD AD = 10 - 7 = 3 cm

11. (a)  $\sqrt{2}\sin\theta$ 

**Explanation:** Given:  $\sin\theta + \cos\theta = \sqrt{2}\cos\theta$ Squaring both sides, we get  $\Rightarrow \sin^2\theta + \cos^2\theta + 2\sin\theta\cos\theta = 2\cos^2\theta$  $\Rightarrow \cos^2\theta - 2\sin\theta\cos\theta = \sin^2\theta$ 

Page 10 of 21

Get More Learning Materials Here : **\_** 

$$\Rightarrow \cos^2\theta - 2\sin\theta\cos\theta + \sin^2\theta = 2\sin^2\theta$$
$$\Rightarrow (\cos\theta - \sin\theta)^2 = 2\sin^2\theta$$
$$\Rightarrow \cos\theta - \sin\theta = \sqrt{2}\sin\theta$$

12.

(d) 
$$\frac{a^2+b^2}{a^2-b^2}$$
  
Explanation:  $\tan \theta = \frac{a}{b}$   
 $\frac{a \sin \theta + b \cos \theta}{a \sin \theta - b \cos \theta} = \frac{a \frac{\sin \theta}{\cos \theta} + b \frac{\cos \theta}{\cos \theta}}{a \frac{\sin \theta}{\cos \theta} - b \frac{\cos \theta}{\cos \theta}}$  (Dividing by  $\cos \theta$ )  
 $= \frac{a \tan \theta + b}{a \tan \theta - b} = \frac{a \times \frac{a}{b} + b}{a \times \frac{a}{b} - b}$   
 $= \frac{\frac{a^2}{b} + b}{\frac{a^2}{b} - b} = \frac{\frac{a^2 + b^2}{b}}{\frac{a^2 - b^2}{b}}$   
 $= \frac{a^2 + b^2}{b} \times \frac{b}{a^2 - b^2}$ 

13. (a) 30 m

**Explanation:** Let AB be the observer and CD =h metres be the tower.

BE = AC = 28.5 m.

From right  $\triangle \text{BED}$ , we have

$$\frac{DE}{BE} = \tan 45^{\circ} \Rightarrow \frac{DE}{28.5 \text{ m}} = 1$$
$$\Rightarrow \text{ De} = 28.5 \text{ m}$$
$$\therefore \text{ h} - 1.5 = 28.5 \Rightarrow \text{ h} = 30.$$

14. **(a)**  $\sqrt{3\pi}$  cm

**Explanation:** Let the length of side of square be x cm

7

Then area of square =  $x^2 cm^2$ 

Area of sector of circle =  $\frac{\theta}{1} \times \pi r^2$ 

$$= \frac{90^{\circ}}{360^{\circ}} \times \pi r^{2} \quad [\because \text{ angle of square} = \theta = 90^{\circ}]$$
  
$$\therefore \text{ Shaded area} = \frac{\pi \times 4}{4} = \pi$$
  
According to question, Area of square = 3 × shaded

 $\Rightarrow 3\pi = x^2 \therefore x = \sqrt{3\pi}$  cm

15.

(b) 
$$\frac{\pi r^2}{4} - \frac{1}{2}r^2$$
  
Explanation:  $\frac{\pi r^2}{4} - \frac{1}{2}r^2$ 

16.

**(b)**  $\frac{3}{8}$ 

**Explanation:** Area of square JMLK =  $6^2 = 36$  sq. units A and B are the mid-points of sides KL and LM.  $\therefore$  AL = KA = LB = BM = 3 units Now, Area of  $\triangle$ ALB =  $\frac{1}{2} \times$  AL  $\times$  LB =  $\frac{1}{2} \times 3 \times 3 = \frac{9}{2}$  sq. units

Page 11 of 21

area

Get More Learning Materials Here :

Area of  $\triangle JMB = \frac{1}{2} \times BM \times JM = \frac{1}{2} \times 6 \times 3 = 9$  sq. units Area of  $\triangle KAJ = \frac{1}{2} \times KJ \times KA = \frac{1}{2} \times 6 \times 3 = 9$  sq. units Total area of all the three triangles =  $(\frac{9}{2} + 9 + 9)$ =  $\frac{45}{2}$  sq. units  $\therefore$  Area of  $\triangle JAB = (36 - \frac{45}{2}) = \frac{27}{2}$  sq. units  $\therefore$  Required probability =  $\frac{27}{\frac{2}{36}} = \frac{27}{2 \times 36} = \frac{3}{8}$ 

17.

# (c) 15

**Explanation:** Given, Number of red ball = 5 Number of green ball = n  $\therefore$  Total ball = n + 5 Now P(red ball) =  $\frac{5}{n+5}$ and P(green ball) =  $\frac{n}{n+5}$ Now, according to the question  $\frac{n}{n+5} = \frac{3\times5}{n+5}$ n = 15 So, number of green ball = 15

# 18.

#### (b) 315

**Explanation:** Class having maximum frequency is the modal class. hence, modal class : 150-155

 $\therefore$  Lower limit of the modal class = 150

Also, N =  $60 \Rightarrow \frac{N}{2} = 30$ 

The cumulative frequency just greater than 30 is 37.

Hence, the median class is 160-165.

 $\therefore$  Upper limit of the median class = 165

Required sum = 150 + 165 = 315

# 19.

(d) A is false but R is true.Explanation: A is false but R is true.

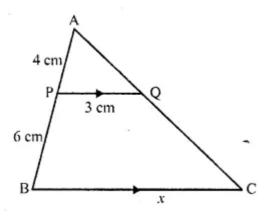

20. **(a)** Both A and R are true and R is the correct explanation of A.

26. This problem can be solved using H.C.F. because we are cutting or "dividing" the strips of cloth into smaller pieces of 36 and 24 and we are looking for the widest possible strips .

So,

H.C.F. of 36 and 24 is 12 So we can say that

Maya should cut each piece to be 12 inches wide.

28. Let the digits at units and tens place of the given number be x and y respectively

Thus, the number is 10y + x.

The sum of the two digits of the number is 9.

Thus, we have x + y = 9 .....(i)

After interchanging the digits, the number becomes 10x + y.

Also, 9 times the number is equal to twice the number obtained by reversing the order of the digits.

Thus, we have

9(10y + x) = 2(10x + y)

 $\Rightarrow 90y + 9x = 20x + 2y$ 

 $\Rightarrow 20x+2y-90y-9x=0$ 

 $\Rightarrow 11x - 88y = 0$ 

 $\Rightarrow 11(x-8y)=0$ 

 $\Rightarrow x - 8y = 0$ .....(ii)

So, we have the systems of equations

Proof: Let  $\angle PTQ = \theta$ Since TP, TQ are tangents drawn from point T to the circle. TP = TQ  $\therefore$  TPQ is an isoscles triangle  $\therefore \angle TPQ = \angle TQP = \frac{1}{2} (180^{\circ} - \theta) = 90^{\circ} - \frac{\theta}{2}$ Since, TP is a tangent to the circle at point of contact P

- ∴∠OPT = 90°
- $\therefore \angle OPQ = \angle OPT \angle TPQ = 90^{\circ} (90^{\circ} \frac{1}{2} \theta) = \frac{\theta}{2} = \frac{1}{2} \angle PTQ$ Thus,  $\angle PTQ = 2 \angle OPQ$

OR

In the given figure, O is the centre of a circle. PT and PQ are tangents to the circle from an external point P. If  $\angle TPQ = 70^\circ$ , then,we have to find  $\angle TRQ$ .

We know that the radius and tangent are perpendicular at their point of contact.

 $\angle OTP = \angle OQP = 90^{\circ}$ Now, In quadrilateral OQPT  $\angle QOT + \angle OTP + \angle OQP + \angle TPQ = 360^{\circ}$  [Angle sum property of a quadrilateral]  $\angle QOT + 90^{\circ} + 90^{\circ} + 70^{\circ} = 360^{\circ}$  $250^{\circ} + \angle QOT = 360^{\circ}$  $\angle QOT = 110^{\circ}$ We know that the angle subtended by an arc at the centre is double of the angle subtended b

We know that the angle subtended by an arc at the centre is double of the angle subtended by the arc at any point on the circumference of the circle.

 $\angle TRQ = \frac{1}{2} \angle QOT \Rightarrow \angle TRQ = \frac{1}{2} \times 110^{\circ} = 55^{\circ}$ 

30. Given,  $1 + \sin^2 \theta = 3 \sin \theta \cos \theta$ , then we have to prove that  $\tan \theta = 1$ , or  $\frac{1}{2}$ .

Now, 
$$1 + \sin^2\theta = 3 \sin\theta \cos\theta$$
  
[Dividing by  $\sin^2 \theta$  0n both sides]  
 $\Rightarrow \frac{1}{\sin^2 \theta} + \frac{\sin^2 \theta}{\sin^2 \theta} = \frac{3 \sin \theta \cos \theta}{\sin^2 \theta}$   
 $\Rightarrow \csc^2 \theta + 1 = 3 \cot \theta$   
 $\Rightarrow 1 + \cot^2 \theta + 1 - 3 \cot \theta = 0$   
 $\Rightarrow \cot^2 \theta - 3 \cot \theta + 2 = 0$   
 $\Rightarrow \cot^2 \theta - 2 \cot \theta - \cot \theta + 2 = 0$   
 $\Rightarrow \cot \theta (\cot \theta - 2) - 1(\cot \theta - 2) = 0$   
 $\Rightarrow \cot \theta - 2) (\cot \theta - 1) = 0$   
 $\Rightarrow \cot \theta - 2 = 0 \text{ or } (\cot \theta - 1) = 0$   
 $\Rightarrow \cot \theta = 2 \text{ or } \cot \theta = 1$   
 $\Rightarrow \tan \theta = \frac{1}{2} \text{ or } \tan \theta = 1$
