## **Determinants**

- Determinant of a square matrix A is denoted by |A| or det (A).
- Determinant of a matrix  $A = [a]_{1 \times 1}$  is |A| = |a| = a
- Determinant of a matrix  $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$  is given by,  $|A| = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} a_{21}a_{12}$

$$A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ \vdots & \vdots & \vdots \\ a_1 & a_2 & a_3 \end{bmatrix}$$

 $A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}$  is given by (expanding along  $R_1$ ): Determinant of a matrix

$$A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix} = (-1)^{1+1} a_1 \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} + (-1)^{1+2} a_2 \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} + (-1)^{1+3} a_3 \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}$$
$$= a_1 \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}$$

Similarly, we can find the determinant of A by expanding along any other row or along any column.

- The various properties of determinants are as follows:
- If the rows and the columns of a square matrix are interchanged, then the value of the determinant remains unchanged.

## Example:

$$|A| = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

This property is same as saying, if A is a square matrix, then |A| = |A'|

If we interchange any two rows (or columns), then sign of determinant changes.

## **Example:**

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = - \begin{vmatrix} b_1 & a_1 & c_1 \\ b_2 & a_2 & c_2 \\ b_3 & a_3 & c_3 \end{vmatrix}, \text{ by applying } C_1 \leftrightarrow C_2$$
$$= \begin{vmatrix} b_3 & a_3 & c_3 \\ b_2 & a_2 & c_2 \\ b_1 & a_1 & c_1 \end{vmatrix}, \text{ by applying } R_1 \leftrightarrow C_3$$

If any two rows or any two columns of a determinant are identical or proportional, then the
value of the determinant is zero.

**Example:** 

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ ka_1 & kb_1 & kc_1 \end{vmatrix} = 0$$
, where k is a constant

• If each element of a row or a column of determinant is multiplied by a constant *a*, then its determinant value gets multiplied by *a*.

**Example:** Area of a triangle with vertices  $(x_1, y_1)$ ,  $(x_2, y_2)$ , and  $(x_3, y_3)$  is given by,

$$\Delta = \frac{1}{2} \begin{bmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{bmatrix}$$

Since area is always positive, we take the absolute value of the above determinant.

- If A is a square matrix, then A(adj A) = (adj A) A = |A| I
- A square matrix *A* is said to be singular, if A=0
- A square matrix A is said to be non-singular, if  $|A| \neq 0$
- If A and B are square matrices of same order, then |AB| = |A||B|

Therefore, if *A* and *B* are non-singular matrices of same order, then *AB* and *BA* are also non-singular matrices of same order.

- If A is a non-singular matrix of order n, then  $|adj A| = |A|^{n-1}$
- A square matrix *A* is invertible, if and only if *A* is non-singular and inverse of *A* is given by the formula:

$$A^{-1} = \frac{1}{|A|}(adjA)$$

- If A is a square matrix, then A(adjA) = (adjA)A = |A|I
- A square matrix A is said to be singular, if  $|A| \neq 0$
- A square matrix A is said to be non-singular, if  $|A| \neq 0$
- If A and B are square matrices of same order, then |AB| = |A||B|

Therefore, if *A* and *B* are non-singular matrices of same order, then *AB* and *BA* are also non-singular matrices of same order.

- If A is a non-singular matrix of order n, then  $\left| AdjA \middle| (adjA) \middle| = |A|^{n-1}$ • A square matrix 4 in the square matrix 6 in the sq
- A square matrix *A* is invertible, if and only if *A* is non-singular and inverse of *A* is given by the formula:

$$A^{-1} = \frac{1}{|A|}(adjA)$$

$$a_1 x + b_1 y + c_1 z = d_1$$
  
 $a_2 x + b_2 y + c_2 z = d_2$ 

• The system of following linear equations  $a_3x + b_3y + c_{\mathcal{Z}} = d_3$  can be written as AX = B, where

$$A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}, B = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$$

- A system of linear equations is said to be consistent, if its solution (one or more) exists.
- A system of linear equations is said to be inconsistent, if its solution does not exist.
- Unique solution of the equation AX = B is given by  $X = A^{-1} B$ , where  $|A| \neq 0$
- For a square matrix A in equation AX = B, if
- $\circ$  |A| ≠ 0, then there exists a unique solution
- $|A| \neq 0$  and  $(adjA) B \neq 0$ , then no solution exists
- $|A| \neq 0$  and  $(adjA) B \neq 0$ , then the system may or may not be consistent

**Example 2:** Solve the following system of linear equations:

$$x - 3y + 4z = 12$$
  
 $2x + 2y - 3z = -7$   
 $6x - y + 2z = 13$ 

**Solution:** The given system of equations can be written in the form AX = B, where

$$A = \begin{bmatrix} 1 & -3 & 4 \\ 2 & 2 & -3 \\ 6 & -1 & 2 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$$
 and 
$$B = \begin{bmatrix} 12 \\ -7 \\ 13 \end{bmatrix}$$

Now, 
$$|A| = 1[2 \times 2 - (-1)(-3)] + 3[2 \times 2 - 6(-3)] + 4[2 \times (-1) - 6 \times 2] = 11 \neq 0$$

Therefore, *A* is a non-singular matrix and hence, the given system of linear equations has only one solution.

Now,  

$$A_{11} = [2 \times 2 - (-1)(-3)] = 1$$

$$A_{12} = -[2 \times 2 - 6(-3)] = -22$$

$$A_{13} = [2(-1) - 6 \times 2] = -14$$

$$A_{21} = -[(-3) \times 2 - (-1) \times 4] = 2$$

$$A_{22} = [1 \times 2 - 6 \times 4] = -22$$

$$A_{23} = -[1(-1) - 6(-3)] = -17$$

$$A_{31} = [(-3)(-3) - 4 \times 2] = 1$$

$$A_{32} = -[1(-3) - 2 \times 4] = 11$$

$$A_{33} = [1 \times 2 - 2(-3)] = 8$$

$$\therefore A^{-1} = \frac{1}{|A|}(adjA) = \frac{1}{11}\begin{bmatrix} 1 & 2 & 1 \\ -22 & -22 & 11 \\ -14 & -17 & 8 \end{bmatrix}$$

$$Now, X = A^{-1}B$$

$$\Rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{11} \begin{bmatrix} 1 & 2 & 1 \\ -22 & -22 & 11 \\ -14 & -17 & 8 \end{bmatrix} \begin{bmatrix} 12 \\ -7 \\ 13 \end{bmatrix} = \frac{1}{11} \begin{bmatrix} 11 \\ 33 \\ 55 \end{bmatrix} = \begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix}$$

$$x = 1, y = 3, \text{ and } z = 5$$
