Statistics

- Mean deviation about mean $[M.D.(\overline{x})]$: • **For ungrouped data:** $M.D.(\overline{x}) = \frac{1}{n} \sum_{i=1}^{n} |x_i - \overline{x}|$, where \overline{x} is the mean given by $\overline{x} = \frac{1}{n} \sum_{i=1}^{n} x_i$
- Mean deviation about mean $[M.D.(\bar{x})]$:
- For grouped data: $M.D.(\overline{x}) = \frac{1}{n} \sum_{i=1}^{n} f_i |x_i \overline{x}|$, where \overline{x} is the mean given by $\overline{x} = \frac{1}{N} \sum_{i=1}^{n} f_i x_i$

Example:Calculate mean deviation about mean for the following data:

Class	Class 0 - 10 10 -		20 – 30	30 - 40
Frequency	21	19	49	11

Solution: Here, assumed mean (a) = 25 and class size (h) = 10

Class	Frequency (fi)	Mid- point (<i>xi</i>)	$d_i = \frac{x_i - 25}{10}$	fidi	$ x_i - \overline{x} $	$f_i x_i - \overline{x} $
0 - 10	21	5	-2	-42	15	315
10 - 20	19	15	-1	-19	5	95
20 - 30	49	25	0	0	5	245
30 - 40	11	35	1	11	15	165
Total	100			-50		820

Here,
$$N = \sum_{i=1}^{4} f_i = 100$$

Now,

 $\overline{x} = a + \frac{1}{N} \sum_{i=1}^{4} f_i d_i \times h = 25 + \frac{(-50)}{100} \times 10 = 25 - 5 = 20$ $\therefore M.D\left(\overline{x}\right) = \frac{1}{N} \sum_{i=1}^{4} f_i \left| x - \overline{x} \right| = \frac{1}{100} \times 820 = 8.2$

Example:

Find the mean deviation about the median for the following data: 181, 29, 150, 270, 160, 16, 27, 180, 200

Solution:

Here, the number of observations is 9 and these can be arranged in ascending order as 16, 27, 29, 150, 160, 180, 181, 200, 270

Median, M =
$$\left(\frac{9+1}{2}\right)^{\text{th}}$$
 observation or 5th observation = 160
 \therefore M.D.(M) = $\frac{1}{9}\sum_{i=1}^{9} |x_i - M|$
= $\frac{1}{9} \left(|16 - 160| + |27 - 160| + |29 - 160| + |150 - 160| + |160 - 160| + |181 - 160| + |200 - 160| + |270 - 160| \right)$
= $\frac{1}{9} (144 + 133 + 131 + 10 + 0 + 20 + 21 + 40 + 110)$
= $\frac{1}{9} \times 609$
= 67.67

- The mean of the squares of the deviations from mean is called the variance and it is • denoted by s^2 .
- Variance of Data:
- For ungrouped data: $\sigma^{2} = \frac{1}{n} \sum_{i=1}^{n} (x_{i} \overline{x})^{2}$ (In direct method) or $\sigma^{2} = \frac{1}{n} \sum_{i=1}^{n} x_{i}^{2} (\overline{x})^{2}$ (In shortcut method), where \overline{x} is the mean. 0
- Standard deviation is the square root of variance and it is denoted bys. This means:

Standard Deviation= Variance

Example:

The mean and standard deviations of 50 observations were calculated as 30 and 4 respectively. Later, it was found that by mistake, 13 was taken instead of 18 for one observation during the calculation. Find the correct mean and the correct standard deviation.

Solution: It is given that, number of observations (*n*) = 50 Incorrect mean, $\overline{x} = 30$ Incorrect standard deviation (s) = 4 We know that $\overline{x} = \frac{1}{n} \sum_{i=1}^{n} x_i$ i.e. $30 = \frac{1}{50} \sum_{i=1}^{50} x_i$ or $\sum_{i=1}^{50} x_i = 1500$ Incorrect sum of observations = 1500 $\therefore \text{Correct sum of observations} = 1500 - 13 + 18 = 1505$ $\therefore \text{ Correct mean} = \frac{1505}{50} = 30.1$ Now, standard deviation, $\sigma = \sqrt{\frac{1}{n}\sum_{i=1}^{n} x_i^2 - (\overline{x})^2}$

Get More Learning Materials Here :

$$\Rightarrow \sigma = 4 = \sqrt{\frac{1}{50} \times \text{Incorrect}} \sum_{i=1}^{n} x_i^2 - 900$$

$$\Rightarrow 16 = \frac{1}{50} \times \text{Incorrect}} \sum_{i=1}^{n} x_i^2 - (30)2$$

$$\Rightarrow \text{Incorrect} \sum_{i=1}^{n} x_i^2 = 916 \times 50 = 45800$$

Now, correct} \sum_{i=1}^{n} x_i^2 = \text{Incorrect} \sum_{i=1}^{n} x_i^2 - (13)^2 + (18)^2 = 45800 - 169 + 324 = 45955
Correct standard deviation

$$= \sqrt{\frac{C \text{ orrect } \Sigma x_i^2}{n}} - (C \text{ orrect } \text{mean})^2$$

$$= \sqrt{\frac{45955}{50}} - (30.1)^2$$

$$= \sqrt{919.1 - 906.01}$$

$$= \sqrt{13.09} = 3.62$$

- Variance of Data:
- For discrete frequency distribution: $\sigma^{2} = \frac{1}{N} \sum_{i=1}^{n} f_{i} (x_{i} - \overline{x})^{2} \quad \text{(In direct method)}$ or $\sigma^{2} = \frac{1}{N^{2}} \left[N \sum_{i=1}^{n} f_{i} x_{i}^{2} - \left(\sum_{i=1}^{n} f_{i} x_{i} \right)^{2} \right] \quad \text{(In shortcut method), where } \overline{x} \text{ is the mean}$ and $N = \sum_{i=1}^{n} f_{i}$
- Standard deviation is the square root of variance and it is denoted by σ.
 Standard Deviation = √Variance
- Variance of Data:
- For continuous frequency

$$\sigma^{2} = \frac{1}{N} \sum_{i=1}^{n} f_{i} (x_{i} - \overline{x})^{2} \text{ or } \sigma^{2} = \frac{1}{N^{2}} \left[N \sum_{i=1}^{n} f_{i} x_{i}^{2} - \left(\sum_{i=1}^{n} f_{i} x_{i} \right)^{2} \right]$$
(Indirect distribution:
$$\sigma^{2} = \frac{h^{2}}{N^{2}} \left[N \sum_{i=1}^{n} f_{i} y_{i}^{2} - \left(\sum_{i=1}^{n} f_{i} y_{i} \right)^{2} \right]$$
(Indirect method) or

 $x_i = \text{class marks of the class intervals}, \overline{x} = \text{mean}, N = \sum_{i=1}^{n} f_i$, $h = \text{width of the class intervals}, y_i = \frac{x_i - A}{h}$, where A is the assumed mean.

• Standard deviation is the square root of variance and it is denoted bys. This means:

Standard Deviation = √Variance

Example:Find the variance and standard deviation for the following data.

Class	10 - 20	20 - 30	30 - 40	40 – 50	50 - 60
Frequency	5	4	3	1	7

Solution: Let assumed mean, A = 35

Here, *h* = 10, N = 20

We obtain the following table from the given data.

Class	Frequency (fi)	Mid- points (<i>x_i</i>)	$y_i = \frac{x_i - 35}{10}$	yi ²	fiyi	fiyi²
10 - 20	5	15	-2	4	-10	20
20 - 30	4	25	-1	1	-4	4
30 - 40	3	35	0	0	0	0
40 - 50	1	45	1	1	1	1
50 - 60	7	55	2	4	14	28
Total	N = 20					

• The measure of variability, which is independent of units, is called the coefficient of variation. The coefficient of variation (C.V.) is defined as

C.V = $\frac{\sigma}{x} \times 100$, $\overline{x} \neq 0$ Where, σ and \overline{x} are standard deviation and mean of the data respectively.

- For comparing the variability or dispersion of two series, we first calculate the C.Vs of each series. The series having higher C.V. is said to be more variable than the other and the series having lower C.V. is said to be more consistent than the other.
- For two series with equal mean values, the series with greater standard deviation (or variance) is more variable or dispersed than the other. Also, the series with lower value of standard deviation (or variance) is said to be more consistent or less scattered than the other.

Example:Which series, I or II, is more consistent?

	Series I	Series II
Mean	3100	3100
Variance	121	169

Solution: Standard deviation of series I, $\sigma_1 = \sqrt{121} = 11$

Standard deviation of series II, $\sigma_2 = \sqrt{169} = 13$

Since the mean of both the series is the same, the series with lower standard deviation will be more consistent.

Thus, series I will be more consistent.
