ALCOHOLS, ETHERS AND PHENOLS

1. INTRODUCTION

The compounds in which hydroxyl group (–OH) is attached to a saturated carbon atom are called as **Alcohols**. The compounds in which a hydroxyl group is attached to an unsaturated carbon atom of a double bond are called as **Enols**. The saturated carbon may be that of an alkyl, alkenyl, alkynyl, cycloalkyl or benzyl group. However, if a hydroxyl group is attached to a benzene ring, the compounds are called as **Phenols**.

The alcohols are further classified as: **Monohydric** (containing one –OH group), **Dihydric** (containing two –OH groups) and **Trihydric** (containing three –OH groups).

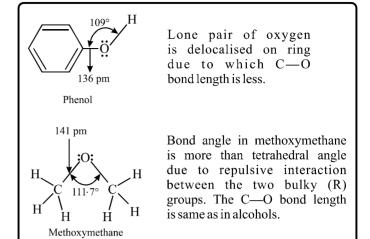

Alcohols find usage in industry as well as day to day life. For example, ordinary spirit used for polishing wooden furniture is chiefly ethanol. Sugar, cotton, paper are all made up of compounds containing –OH groups. Phenols are used in several important polymers such as *Bakelite* and in several drugs such as *Aspirin*. Ethers are commonly used as solvents and anaesthetics.

2. CLASSIFICATION

СН ₃ —ОН	Methanol	
R —СН₂—ОН	1° Alcohol	Primary
R R—CH—OH R	2° Alcohol	Secondary
R—C—OH 	3° Alcohol	Tertiary
R—O—R	Symmetrical E	Ether
R—O—R'	Unsymmetrica	al Ether

3. STRUCTURES OF FUNCTIONAL GROUPS

In alcohols, the oxygen of the -OH group is attached to carbon by a sigma (σ) bond formed by the overlap of a sp³ hybridised orbital of carbon with a sp³ hybridised orbital of oxygen. The following figure depicts structural aspects of methanol, phenol and methoxymethane.

4. PHYSICAL PROPERTIES

4.1 Boiling Point

The boiling points of alcohols and phenols increase with increase in the number of carbon atoms (increase in van der Waals forces). In alcohols, the boiling point decreases with increase in branching (decrease in Van der Waals forces due to decrease in surface area).

The –OH group in alcohols and phenols contains a hydrogen, bonded to an electronegative oxygen atom. Therefore, it is capable of forming intermolecular hydrogen bond, strength of which is even greater than amine.

It is due to the presence of strong intermolecular hydrogen bonding that alcohols and phenols have higher boiling points corresponding to other classes of compounds, namely, hydrocarbons, ethers and haloalkanes/haloarenes, amines of comparable molecular masses.

Their boiling points are lower than carboxylic acid which have even more strong H-bond. For isomeric alcohols boiling points decreases with increase in branching due to decrease in van der Waals forces with decrease in size. The order of boiling point is 1° alcohol > 2° alcohol > 3° alcohol.

In ethers, boiling point is very less, and comparable to those of alkane of comparable molecular mass due to less dipole moment and absence of H-bonding.

4.2 Solubility

The solubility of alcohols and phenols in water is due to their ability to form hydrogen bonds with water molecules. The solubility decreases with increase in the size of hydrophobic group (R). Higher alcohol are insoluble. Branching increases solubility, due to decrease in surface area of non-polar hydrocarbon part.

n-butyl alcohol < isobutyl alcohol < sec-butyl alcohol < tert-butyl alcohol

Lower ethers are water soluble but solubility is less than alcohol due to less H-bonding with water and low polarity.

Refer to Table 1, 2, 3 and 4 for reference to physical properties of alcohols, phenols and ethers.

5. PREPARATION OF ALCOHOLS

Carbonyl Compounds 1. Hydrogenation 2. LiAlH₄/NaBH₄ 3. Meerwein-Pondroff-Verley Reduction Alkanes 1. Controlled Oxidation Alkenes 1. Acid Catalyzed Hydration 2. Oxymercuration-Demercuration

5.1 Alkane

Controlled Oxidation

$$CH_4 + [O] \xrightarrow{\text{Cu tube}} CH_3OH$$

$$200^{\circ}C$$

3. Hydroboration-Oxidation4. Hydroxylation to Diols

5.2 Alkenes

5.2.1 Acid Catalyzed Hydration

Markovnikov addition with carbocation rearrangements.

$$\begin{array}{c} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c}$$

Markovnikov orientation

5.2.2 Oxymercuration-Demercuration

Markovnikov addition without carbocation rearrangements.

Example - 1

$$H_{2}C = C$$
 CH_{3}
 $(1) Hg(OAc)_{2}, H_{2}O$
 CH_{3}
 CH_{2}
 CH_{3}
 CH_{3}
 CH_{3}
 CH_{4}
 CH_{3}

5.2.3 Hydroboration-Oxidation

Anti-Markovnikov addition.

Example - 2

$$H_{2}C = C \xrightarrow{CH_{3}} \xrightarrow{(1) \text{ BH}_{3} \cdot \text{THF}} CH_{2} \xrightarrow{CH_{2}} CH_{3}$$

$$CH_{3} \xrightarrow{(2) \text{ H}_{2}O_{2}, \text{ NaOH}} CH_{2} \xrightarrow{C} CH_{3}$$

5.2.4 SYN Hydroxylation

Reagents: Cold dil. KMnO₄/NaOH or OsO₄/H₂O₂

Example - 3

$$\begin{array}{c|c} & & & & \\ \hline & OsO_4/H_2O_2 & & & \\ \hline & or \ KMnO_4/NaOH & & & \\ \hline & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ \end{array}$$

Cyclopentene

cis-Cyclopentane-1, 2-diol

5.2.5 ANTI Hydroxylation

Reagents: Peroxy Acids followed by Acidic Hydrolysis

Example - 4

$$\begin{array}{c} & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ &$$

Cyclopentene

trans-Cyclopentane-1, 2-diol (+ Enantiomer)

5.3 Alkyl Halide

5.3.1 Second-order Substitution

Primary (and some Secondary) Halides

Example - 5

$$(CH_3)_2CHCH_2CH_2$$
—Br \xrightarrow{KOH} $(CH_3)_2CHCH_2CH_2$ —OH

5.3.2 First-order Substitution

Tertiary (and some Secondary) Halides

Example - 6

5.3.3 Grignard Reagent/Organolithium Reagent

Nucleophilic addition to the carbonyl group

(a) Addition to Formaldehyde - 1° Alcohol

Example - 7

CH₃CH₂MgBr + H₂C=O
Ethyl Magnesium Bromide
$$(1) \text{ Ether}$$

$$(2) \text{ H}_3\text{O}$$
CH₃CH₂—CH₂—OH

(b) Addition to an Aldehyde - 2° Alcohol

Example - 8

$$MgBr$$
 $+ CH_3$ $-C$ $-H$

Phenyl Magnesium Bromide

Acetaldehyde

$$(1) \text{ Ether} \\ (2) \text{ H}_3 \text{O}^{\bigoplus}$$

$$H \\ C \\ C \\ C \\ C \\ H_3$$
1-Phenylethanol

(c) Addition to a Ketone - 3° Alcohol

$$CH_{3}CH_{2}MgCl + \underbrace{ (1) \ Ether }_{(2) \ H_{3}O} \underbrace{OH}_{CH_{2}CH_{3}}$$

$$Cyclohexanone$$

$$1-Ethylcyclohexanol$$

(d) Addition to an Acid Halide or an Ester - 3° Alcohol

Example - 10

CH₃—C—Cl or CH₃—C—OCH₃

Acetyl Chloride Methyl Acetate

$$(1) 2 \longrightarrow MgBr$$
Cyclohexylmagnesium Bromide
$$(2) H_3O$$

OH
$$CH_3 \longrightarrow C$$

$$1, 1-Dicyclohexylethanol$$

(e) Addition to Ethylene Oxide - $I^{\circ}Alcohol$ (with two carbon atoms added)

Example - 11

$$\begin{array}{c} \text{MgBr} \\ \hline \\ \text{(1) CH}_2 \\ \hline \\ \text{(2) H}_3 \\ \text{O} \\ \end{array} \\ \begin{array}{c} \text{CH}_2 \\ \text{CH}_2 \\ \text{OH} \\ \end{array}$$
 Cyclohexyl Magnesium Bromide 2-Cyclohexylethanol

5.4 Carbonyl Compounds

5.4.1 Catalytic Hydrogenation

$$\begin{array}{c} O \\ \parallel \\ -C - + H_2 \end{array} \xrightarrow{\text{Raney Ni}} \begin{array}{c} OH \\ \mid \\ -CH - \end{array}$$

This method is usually not as selective or as effective as the use of hydride reagents.

5.4.2 Reduction with Metal Hydrides

1. Reduction of an aldehyde gives a primary alcohol

Example - 12

2. Reduction of a ketone gives a secondary alcohol

Example - 13

3. Reduction of an acid or ester gives a primary alcohol

Example - 14

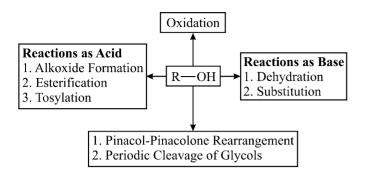

CH₃—(CH₂)₈—C—OH or CH₃—(CH₂)₈—C—OCH
Decanoic Acid Methyl Decanoate
$$\downarrow (1) \text{ LiAlH}_4 \\ (2) \text{ H}_3 O^{\bigoplus}$$
CH₃—(CH₂)₈—CH₂—OH
Decan-1-ol

Reactions of LiAlH₄ and NaBH₄

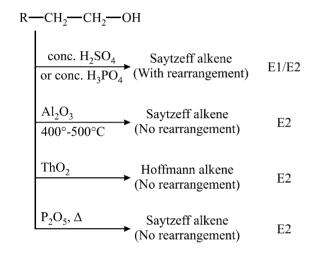

Functional Group	Structure	NaBH ₄	LiAlH ₄	
Aldehyde	O R—C—H	R—СН₂—ОН	R—СН₂—ОН	
Ketone	O R—C—R'	OH - R—CH—R'	OH R—CH—R'	
Alkene)c=c(No Reaction	No Reaction	
Acid Anion	R—C—O anion in base	No Reaction	R—СН₂—ОН	
Ester	O R—C—OR'	No Reaction	R—CH ₂ OH + R'OH	

6. REACTIONS OF ALCOHOLS

6.1 Dehydration

Reactions with Al₂O₃, ThO₂ and P₂O₅ occur in gaseous phase.

6.2 Substitution

$$RX + H_2O \qquad S_N 1/S_N 2$$

$$RX + H_3PO_3 \qquad S_N 2$$

$$RX + POX_3 + HX \qquad S_N 2$$

$$RX + SO_2 \uparrow + HC1 \uparrow \qquad S_N i$$

$$SOC1_2/Pyridine \qquad RX + SO_2 \uparrow + HC1 \uparrow \qquad S_N 2$$

Reaction of alcohol with SOCl₂ in the presence of Pyridine is known as **Darzen's Process**.

6.3 Esterification

$$RO - H + HO - C - R' \longrightarrow RO - C - R' + H_2O$$
Fruity Smell

Esterification is catalyzed by an acid or base.

6.4 Tosylation

Tosylation is used to convert poor leaving group OH into good leaving group OTs.

Example - 15

$$\begin{array}{c|c} & O & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ &$$

Example - 16

$$(CH_3)_2CH$$
—OH $\xrightarrow{TsCl/Pyridine}$ $(CH_3)_2CH$ —OTs Isopropyl Alcohol Isopropyl Tosylate

6.5 Oxidation

(a) Primary Alcohols

$$R \longrightarrow CH_{2}OH$$

$$Alk. KMnO_{4} \longrightarrow RCOOH + MnO_{2} \downarrow + H_{2}O$$

$$Brown$$

$$Acidic K_{2}Cr_{2}O_{7} \longrightarrow RCOOH + Cr_{2}(SO_{4})_{3} + K_{2}SO_{4} + H_{2}O$$

$$Green$$

$$CrO_{3} + H_{2}O \longrightarrow RCOOH$$

$$Acetone \longrightarrow RCOOH$$

$$PCC/PDC \longrightarrow RCHO$$

$$Cu \longrightarrow A(350^{\circ}-400^{\circ}C) \longrightarrow RCHO$$

Oxidation of Alcohols: Points to Remember

- 1. Jones Reagent CrO₃ + H₂O/Acetone
- 2. PCC Pyridinium Chlorochromate
- 3. PDC-Pyridinium Dichromate
- 4. CrO₃/Pyridine in CH₂Cl₂-Collins Reagent.
- 5. Cr (VI) oxidizes primary alcohol to aldehyde in anhydrous/ non-aqueous state and to carboxylic acid otherwise.

(b) Secondary Alcohols

$$R \xrightarrow{\begin{array}{c} H \\ \\ \\ C \\ \\ R_1 \end{array}} OH \xrightarrow{[O]} R \xrightarrow{\begin{array}{c} O \\ \\ \\ \\ Ketone \end{array}} R_1$$

Secondary alcohol in the presence of any oxidising agent is oxidised to ketone.

(c) Tertiary Alcohols

$$R \xrightarrow{R'} OH \xrightarrow{CrO_3/H^{\bigoplus}} No \text{ reaction}$$

$$KMnO_4 \text{ or} \atop K_2Cr_2O_7/H_2SO_4 \atop \Delta \text{ for hours}} Smaller Acid$$

$$CH_3 \xrightarrow{Cu, \Delta} Alkene$$

$$Cu, \Delta \atop Vapour Phase \atop Dehydration} Alkene$$

 ${\rm MnO_2}$ is an oxidising agent which oxidises only allylic, benzylic & propargylic alcohols.

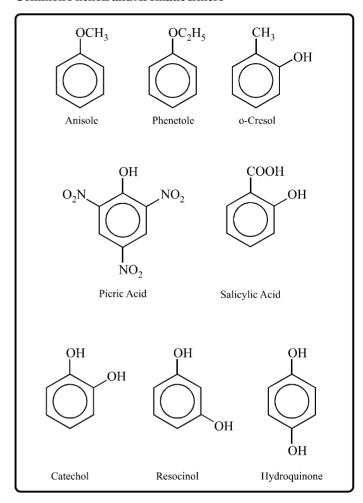

$$R-C=C-C-OH$$

Propargylic Alcohol

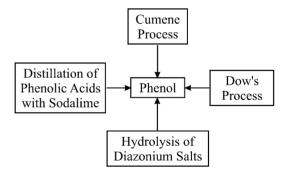

7. PHENOL

$$\begin{array}{c|c} & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & \\ & & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ & \\ &$$

Common Phenols and Aromatic Ethers

8. PREPARATION OF PHENOLS

8.1 Dow's Process

This is industrial method for preparation of phenol. It occurs through Benzyne Mechanism.

Example - 17

$$C_6H_5Cl + 2NaOH \xrightarrow{360^{\circ}C} H_2O + NaCl + C_6H_5O^{\Theta}Na^{\Theta}$$

$$\downarrow H^{\Theta}$$

$$C_6H_5OH$$

$$\begin{array}{c} & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & &$$

8.2 Cumene Process

Example - 18

$$C_{6}H_{6} + C_{3}H_{6} \xrightarrow{AlCl_{3}} C_{6}H_{5} \xrightarrow{C} C \xrightarrow{H_{3}} C_{4}H_{5}$$

$$CH_{3}$$

$$Cumene$$

$$CH_{3}$$

8.3 Hydrolysis of Diazonium Salts

$$\mathrm{ArN}_{2}^{\bigoplus}\mathrm{HSO}_{4}^{\boxminus} + \mathrm{H}_{2}\mathrm{O} \longrightarrow \mathrm{ArOH} + \mathrm{N}_{2} + \mathrm{H}_{2}\mathrm{SO}_{4}$$

8.4 Distillation of Phenolic Acids with Sodalime

Example - 19

$$\begin{array}{c|c}
OH & O^{\Theta} N_{a}^{\Theta} \\
\hline
CO_{2}N_{a} & + Na_{2}CO_{2}
\end{array}$$

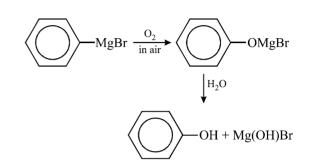

8.5 Benzene

Example - 20

$$+ H_2O_2 \xrightarrow{\text{HSO}_3F} OH$$
Acid

8.6 Grignard Reagent

Example - 21

9. REACTIONS OF PHENOLS

9.1 Formation of Ethers

(a) Williamson Synthesis

$$Ar \longrightarrow Ar \longrightarrow Ar \bigcirc R' + X^{\Theta}$$

$$ArOH \xrightarrow{OH^{\Theta}} ArO^{\Theta}$$

$$(CH_3)_2SO_4$$

$$Ar \longrightarrow O \longrightarrow CH_3 + CH_3 \longrightarrow O \longrightarrow SO_3$$

(b) Nucleophilic Aromatic Substitution

$$\begin{array}{c|c} CI & OC_2H_5 \\ \hline & NO_2 & NO_2 \\ + Na & OC_2H_5 & \\ \hline & NO_2 & \\ \hline & NO_2 & \\ \end{array}$$

9.2 Formation of Esters

Example - 23

$$(CH_3CO)_2O + C_6H_5OH + NaOH$$

$$\downarrow$$
 $CH_3COOC_6H_5 + CH_3COO^{\Theta}N_a^{\Theta} + H_2O$
Phenyl Acetate

Example - 24

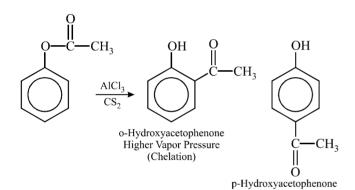

$$C_6H_5COCl + C_6H_5OH + NaOH$$

$$\downarrow$$

$$C_6H_5COOC_6H_5 + NaCl + H_2O$$
Phenyl Benzoate

9.3 Fries Rearrangement

Example - 25

Noto.

${\bf Kinetic\ Control\ versus\ Thermodynamic\ Control}$

- 1. Para isomer is the major product at 25°C. It has lower ΔH and is formed more rapidly (rate controlled product).
- 2. Ortho isomer is the chief product at 165°C (equilibrium controlled product).

9.4 Reactions of Benzene Ring

9.4.1 Hydrogenation

Example - 26

9.4.2 Oxidation to Quinones

Example - 27

9.4.3 Electrophilic Substitution

(a) Halogenation

Example - 28

$$\begin{array}{c}
\text{OH} \\
& \text{OH} \\
& \text{Br}_{2}, \text{H}_{2}\text{O}
\end{array}$$

$$\begin{array}{c}
\text{Br} \\
& \text{Br}
\end{array}$$

2, 4, 6 - Tribromophenol

Example - 29

OH
$$+ Br_{2} \xrightarrow{CS_{2}} + HBr$$

$$Br$$

$$p-Bromophenol$$

$$(major)$$

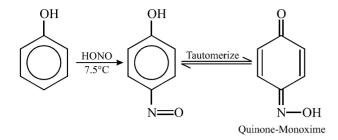

Monobromination is achieved with non-polar solvents such as CS_2 to decrease the electrophilicity of Br_2 and also to minimize phenol ionization. In polar solvents such as water, phenol ionizes to phenoxide ion which is strongly activated and therefore, bromination takes place at all the activated positions.

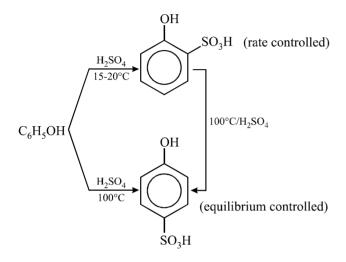

(b) Nitrosation

Example - 30

(c) Sulphonation

Example - 31

(d) Diazonium Salt Coupling - Azophenols

$$ArN_2^{\bigoplus} + C_6H_5G \longrightarrow p-G - C_6H_4 - N = N - Ar$$

G is an electron releasing groups such as -OH, -OR, $-NR_2$, -NHR, $-NH_2$.

(e) Ring Alkylation

Example - 32

$$C_6H_5OH$$
+

 CH_3CH
= CH_2 or $(CH_3)_2CHOH$
 H_2SO_4
or HF

OH

 OH
 $CH(CH_3)_2$

RX and AlCl₃ give poor yields because AlCl₃ co-ordinates with lone pair of oxygen.

(f) Ring Acylation

This is achieved using Fries Rearrangement.

(g) Kolbe's Synthesis

Example - 33

$$C_6H_5O^{\Theta}N_a^{\oplus} + O = C = O \xrightarrow{125^{\circ}C} O - C_6H_4$$

COONa
Sodium Salicylate

 H_3O^{\oplus}

O+ C_6H_4

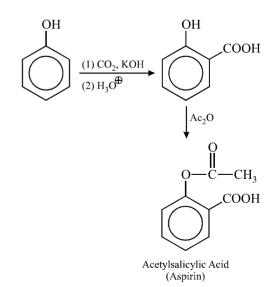

COOH
Salicylic Acid

(h) Riemer-Tiemann Synthesis of Phenolic Aldehydes

Example - 34

This reaction involves formation of carbene, CCl₂.

(i) Formation of Aspirin

(j) Formation of Oil of Wintergreen

Example - 36

10. ETHERS

10.1 Williamson Ether Synthesis

$$R - \ddot{O} \stackrel{\ominus}{:} + R' - X \longrightarrow R - \ddot{O} - R' + X \overset{\ominus}{=}$$

Substrate and Leaving Group in Williamson Synthesis

- 1. Leaving group X = Cl, Br, I, OTs, etc.
- 2. Substrate Alkyl group R' must be primary.

10.2 Alkoxymercuration-Demercuration

This reaction follows Markovnikov orientation.

10.3 Bimolecular Dehydration of Alcohols

This reaction is an industrial method for synthesis of ethers.

$$2R \longrightarrow OH \stackrel{H^{\oplus}}{\longleftrightarrow} R \longrightarrow O \longrightarrow R + H_2O$$

11. REACTIONS OF ETHERS

11.1 Cleavage by HBr and HI

$$R \longrightarrow O \longrightarrow R' \xrightarrow{excess HX} R \longrightarrow X + R' \longrightarrow X$$

$$Ar - O - R$$
 $Ar = Aromatic Ring$
 $X = Aromatic Ring$
 $X = Aromatic Ring$
 $X = Aromatic Ring$

Example - 37

$$\begin{array}{c} \text{CH}_3\text{CH}_2 & \text{--O} & \text{--CH}_3 & \text{Excess HI} \\ \text{Ethyl Methyl Ether} & \text{Ethyl Iodide} & \text{Methyl Iodide} \end{array}$$

11.2 Autoxidation

$$\begin{array}{c} R - O - CH_2 - R' \\ & \downarrow \operatorname{excess} O_2 \\ & \downarrow \operatorname{(slow)} \end{array}$$
 OOH
$$\begin{array}{c} OOH \\ R - O - CH - R' + R - O - O - CH_2 - R' \\ & \operatorname{Hydroperoxide} \end{array}$$
 Dialkyl Peroxide

12. PREPARATION OF EPOXIDES

12.1 Peroxy Acid Epoxidation

12.2 Base-promoted cyclization of halohydrins

$$\begin{array}{c|c}
 & X \\
 & C \\
 & C \\
 & OH
\end{array}$$

$$\begin{array}{c|c}
 & base \\
 & C \\
 & O
\end{array}$$

X = Cl, Br, I, OTs, etc.

$$\begin{array}{c|c} & & & H \\ & & CH - CH_2Cl \xrightarrow{NaOH, H_2O} & & & & \\ & & & CH_2Cl_2 & & & \\ & & & CH_2Cl_2 & & \\ & & & & CH_2Cl_2 & \\ &$$

13. REACTIONS OF EPOXIDES

13.1 Acid-catalyzed Opening

(a) In water

$$-\begin{array}{c|c} & & & & \text{OH} \\ \hline -C & C & & & \\ \hline O & & & & \\ \hline \end{array}$$

Anti stereochemistry is followed.

(b) In alcohols

The alkoxy group bonds to the more highly substituted carbon.

Example - 39

$$\begin{array}{c} H \\ C \\ CH_{2} \\ CH_{3}OH \end{array} \longrightarrow \begin{array}{c} CH \\ CH_{3} \\ C$$

(c) Hydrohalic Acids (X = Cl, Br, I)

13.2 Base-catalyzed Opening

(a) With Alkoxides

(Propylene Oxide)

$$-C \xrightarrow{CH_2} CH_2 \xrightarrow{R-\ddot{O}: \Theta} -C \xrightarrow{C} CH_2 \xrightarrow{CH_2} OR$$

The alkoxy group bonds to the less highly substituted carbon.

Example - 40

$$\begin{array}{c} H \\ C \\ CH_{2} \\ \hline CH_{3} \\ \hline CH_{2} \\ \hline CH_{2} \\ \hline CH_{2} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ CH_{3} \\ \hline CH_{3} \\ C$$

(b) With Organometallics

less substituted carbon

Example - 41

$$\begin{array}{c} H \\ C \longrightarrow CH_2 \\ H_3C \longrightarrow O \\ Propylene Oxide \\ & \downarrow \\ (1) \longleftarrow MgBr \\ (2) H_3O^{\bigoplus} \\ CH_3 \longrightarrow CH \longrightarrow CH_2 \longrightarrow OH \\ \end{array}$$

1-Cyclohexyl-2-Propanol

Note 1

Opening of Epoxide Ring

- 1. In acid catalyzed opening, nucleophile attacks on that epoxide carbon from which more stable carbocation can be made.
- 2. In base catalyzed opening, nucleophile attacks on the less hindered carbon.

14. ACIDIC STRENGTH

(i) Alcohols are weaker acids than thiols even though oxygen is more electronegative than sulphur. Conjugate base of alcohol i.e. RO is more basic than RS as in RO negative charge is placed on smaller oxygen atom so it will have more charge density. But in RS negative charge is dispersed on bigger sulphur so it is a poor base and its conjugate acid will be more acidic. Order of acidic strength of some of the compound are given as:

$$RSO_3H > RCOOH > Phenol > H_2O > ROH >$$

 $HC = CH > NH_3 > CH_2 = CH_2 > CH_3 - CH_3$

(ii) All alcohols (except CH_3OH) are weaker acids than H_2O due to +I effect of alkyl group. CH_3OH is slightly stronger than H_2O . Phenols are stronger than alcohol due to electron withdrawing benzene ring & resonance stabilized phenoxide ion. Alkoxide ions, the conjugate base of alcohol have no resonance so they are less stable and more basic. Phenol is weaker than carboxylic acid which have strong electron withdrawing carbonyl group and more stable resonating structures.

15. TESTS FOR ALCOHOLS, PHENOLS & ETHERS

15.1 Analysis of Alcohols - Characterization

- (a) Alcohols dissolve in cold concentrated sulfuric acid. This property they share with alkenes, amines, practically all compounds containing oxygen, and easily sulfonated compounds. (Alcohols, like other oxygen-containing compounds, form oxonium salts which dissolve in the highly polar sulfuric acid.)
- (b) Alcohols are not oxidized by cold dilute, neutral permanganate (although primary and secondary alcohols are oxidized by permanganate under more vigorous conditions.) However, as we have seen, alcohols often contain impurities that are oxidized under these conditions, and so the permanganate test must be interpreted with caution.
- (c) Alcohols do not decolorize bromine in carbon tetrachloride. This property serves to distinguish them from alkenes and alkynes. Alcohols are further distinguished from alkenes and alkynes and from nearly every other kind of compound by their oxidation by chromic anhydride (CrO₃) in aqueous sulfuric acids. Within two seconds, the clear orange solution turns blue-green and becomes opaque.

Tertiary alcohols do not give this test. Aldehydes do, but are easily differentiated in other ways.

- (d) Reactions of alcohols with sodium metal with the evolution of hydrogen gas is of some use in characterization. A wet compound of any kind, of course, will do the same thing, until the water is used up.
- (e) The presence of the –OH group in a molecule is often indicated by the formation of an ester upon treatment with an acid chloride or anhydride. Some esters are sweet-smelling; others are solids and sharp melting points, and can be derivatives in identifications. If the molecular formulas of starting material and product are determined, it is possible to calculate how many –OH groups are present.
- (f) Whether an alcohol is primary, secondary or tertiary is shown by the **Lucas test**, which is based upon the difference in reactivity of the three classes toward hydrogen halides. Alcohols (of not more than six carbons) are soluble in the Lucas reagent, a mixture of concentrated hydrochloric acid and zinc chloride. The corresponding alkyl chlorides are insoluble. Formation of a chloride from an alcohol is indicated by the cloudiness that appears when the chloride separates from the solution. Hence, the time required for cloudiness to appear is a measure of the reactivity of the alcohol.

A tertiary alcohol reacts immediately with the Lucas reagent, and a secondary alcohol reacts within five minutes. A primary alcohol does not react appreciably at room temperature. Benzyl alcohol and allyl alcohol react as rapidly as teritary alcohols with the Lucas reagent. Allyl chloride, however, is soluble in the reagent.

(g) Whether or not an alcohol contains one particular structural unit is shown by the **iodoform test**. The alcohol is treated with iodine and sodium hydroxide (sodium hypoiodite, NaOI). An alcohol of the structure yields a yellow precipitate of iodoform (CHI₂ m.p. 119°).

$$R \stackrel{H}{\longrightarrow} C \stackrel{C}{\longrightarrow} CH_3$$
 $R = H/R/Ar$ OH

Positive Iodoform Test	Negative Iodoform Test
H 	Any other primary alcohol
H 	H CH ₃ —C—CH ₃ OH
H 	H CH ₃ CH ₂ —C—CH ₂ CH ₃ OH
H 	C ₆ H ₅ —CH ₂ —CH ₂ OH

The reaction involves oxidation, halogenation and cleavage.

$$R \longrightarrow C \longrightarrow CH_3 + NaOI \longrightarrow R \longrightarrow C \longrightarrow CH_3 + NaI + H_2O$$

$$OH \qquad O$$

$$R \longrightarrow C \longrightarrow CH_3 + 3NaOI \longrightarrow R \longrightarrow C \longrightarrow CI_3 + 3NaOH$$

$$0 \qquad O$$

$$R \longrightarrow C \longrightarrow CI_3 + NaOH \longrightarrow RCOO^{\Theta}Na^{\Theta} + CHI_3$$

$$1 \qquad Yellow$$

$$0 \qquad Precipitate$$

As would be expected from the equations, a compound of structure also gives a positive test.

$$R - C - CH_3$$
 $R = H/Alkyl/Aryl$

In certain special cases this reaction is used not as a test, but to synthesize the carboxylic acid, RCOOH. Here, hypobromite or the cheaper hypochlorite would probably be used.

15.2 Analysis of Glycols, Periodic Acid Oxidation

Upon treatment with periodic acid, HIO₄, compounds containing two or more –OH or C=O groups attached to adjacent carbon atoms undergo oxidation with cleavage of carbon-carbon bonds.

$$\begin{array}{ccc}
R - C - C - R' + HIO_4 \longrightarrow RCOOH + R'COOH \\
\parallel & \parallel \\
O & O
\end{array}$$

15.3 Miscellaneous Tests

(a) Ceric Ammonium Nitrate Test - Alcohols give red colour with this reagent.

$$Ce(NH_4)_2(NO_3)_6 + RCH_2OH \rightarrow Ce(NH_4)_2(NO_3)_5 + RCOOH + HNO_3$$

- **(b) Potassium Dichromate Test -** Alcohols turn orange dichromate to green. Tertiary Alcohol do not give this test.
- (c) Ester Test Alcohol gives fruity smell of ester with carboxylic acid.
- (d) Methanol forms oil of winter green with salicylic acid.

15.4 Victor Meyer's Test

1° Alcohol	2° Alcohol	3° Alcohol
$\begin{array}{c} \text{RCH}_2\text{OH} \\ \downarrow^{\text{P}+\text{I}_2} \end{array}$	$\begin{array}{c} R \\ CHOH \\ R \\ \hline \\ P+I_2 \end{array}$	$ \begin{array}{c} R \\ R \\ \hline C \\ P + I_2 \end{array} $
RCH ₂ I AgNO ₂	R CH—I R AgNO ₂	R_3C — I $AgNO_2$
RCH ₂ —NO ₂ HONO	R CH—NO ₂	R ₃ C—NO ₂
R—C—NO ₂	$ \begin{array}{c c} R & C - NO_2 \\ R & N = O \end{array} $	No Reaction NaOH
Nitrolic acid	Pseudonitrol NaOH	Colourless
Blood Red Colour	Blue Colour	

15.5 Differentiation Tests

15.5.1 Alcohols and Phenols

- 1. Litmus Test: Phenol turns blue litmus red but not alcohols.
- 2. FeCl₃: Phenol Neutral FeCl₃ Blue-Violet
- 3. Coupling reaction:

$$Phenol + Diazonium Salt \xrightarrow{\text{weakly basic}} Yellow \text{ or } Orange \text{ Dye}$$

4. Bromine Water Test:

Phenol +
$$Br_2$$
 $\xrightarrow{H_2O}$ Br Br (white ppt.)

Alcohol + Br₂
$$\xrightarrow{\text{H}_2\text{O}}$$
 No Reaction

15.5.2 Alcohols and Ethers

- (a) Alcohols react with Na to give H₂ but not ethers.
- (b) Alcohols give fumes of HCl with PCl₅ but not ethers.

15.5.3 Sodium Bicarbonate Test

Phenol, ROH and H₂O do not displace CO₂ from carbonate & bicarbonates but RCOOH & RSO₃H gives brisk effervescence of CO₂ which proves that RCOOH & RSO₃H are stronger acids H₂CO₃ but phenol is weaker acid than H₂CO₃. Nitrophenols also give effervescence of CO₂ with Na₂CO₃. Trinitrophenol (Picric Acid) is highly acidic due to strong electron withdrawing effect of three groups its acidic strength is comparable to that of carboxylic acids. Its anion is highly resonance stabilised.

RCOOH + NaHCO₃
$$\longrightarrow$$
 RCOONa + CO₂ \uparrow + H₂O
Ph—OH + NaHCO₃ \longrightarrow No Reaction.

$$\begin{array}{c} OH \\ O_2N \\ \hline \\ NO_2 \\ \hline \\ NO_2 \\ \hline \\ O_2N \\ \hline \\ NO_2 \\ \hline \\ NO_2 \\ \hline \\ + CO_2 \uparrow + H_2O \\ \end{array}$$

15.5.4 FeCl₃ Test

Phenol gives characteristic purple colour with FeCl₃ but alcohols do not react with FeCl₃. Carboxylic acids also form buff coloured precipitate with FeCl₃. Only acetic acid forms red coloured precipitate with FeCl₃, so it can be used as a test for acetate salts.

3 OH + FeCl₃ OH + FeCl₃ Purple
$$\downarrow \text{Excess of Phenol}$$
[Fe(PhO)₆]⁻³
Purple Solution

Table 1: Physical Properties of Selected Alcohols

IUPAC Name	Common Name	Formula	MP(°C)	BP(°C)	Density
methanol	methyl alcohol	CH ₃ OH	- 97	65	0.79
ethanol	ethyl alcohol	CH ₃ CH ₂ OH	- 114	78	0.79
1-propanol	n-propyl alcohol	CH ₃ CH ₂ CH ₂ OH	- 126	97	0.80
2-propanol	isopropyl alcohol	(CH ₃) ₂ CHOH	- 89	82	0.79
1-butanol	n-butyl alcohol	CH ₃ (CH ₂) ₃ OH	- 90	118	0.81
2-butanol	sec-butyl alcohol	CH ₃ CH(OH)CH ₂ CH ₃	-114	100	0.81
