## **SEQUENCE AND SERIES**

### **1. DEFINITION**

Sequence is a function whose domain is the set N of natural numbers.

**Real Sequence :** A sequence whose range is a subset of R is called a real sequence.

**Series :** If  $a_1, a_2, a_3, a_4, \dots, a_n$ , ..., is a sequence, then the expression

 $a_1 + a_2 + a_3 + a_4 + a_5 + \dots + \dots + a_n + \dots$  is a series.

A series if finite or infinite according as the number of terms in the corresponding sequence is finite or infinite.

**Progressions :** It is not necessary that the terms of a sequence always follow a certain pattern or they are described by some explicit formula for the n<sup>th</sup> term. Those sequences whose terms follow certain patterns are called progressions.

### 1.1 An Arithmetic Progression (AP)

AP is a sequence whose terms increase or decrease by a fixed number. This fixed number is called the common difference. If a is the first term & d the common difference, then AP can be written as a n<sup>th</sup> term of this AP as  $t_n = a + (n - 1) d$ , where  $d = a_n - a_{n-1}$ .

The sum of the first n terms the AP is given by ;

$$S_n = \frac{n}{2} [2a + (n-1)d] = \frac{n}{2} [a + \ell].$$

where  $\ell$  is the last term.

### **Properties of Arithmetic Progression**

(i) If each term of an A.P. is increased, decreased, multiplied or divided by the same non zero number, then the resulting sequence is also an AP.

(ii) 3 numbers in AP are a - d, a, a + d;

4 numbers in AP are a - 3d, a - d, a + d, a + 3d; 5 numbers in AP are a - 2d, a - d, a, a + d, a + 2d; 6 numbers in AP are a - 5d, a - 3d, a - d, a + d, a + 3d; a + 5d.

- (iii) The common difference can be zero, positive or negative.
- (iv) The sum of the two terms of an AP equidistant from the beginning & end is constant and equal to the sum of first & last terms.
- (v) Any term of an AP (except the first) is equal to half the sum of terms which are equidistant from it.  $a_n = 1/2 (a_{n-k} + a_{n+k}), k < n$ . For  $k = 1, a_n = (1/2) (a_{n-1} + a_{n+1})$ ; For  $k = 2, a_n = (1/2) (a_{n-2} + a_{n+2})$  and so on.

$$(vi) \quad t = S - S$$

- (vii) If a, b, c are in AP  $\Rightarrow$  2 b = a + c.
- (viii) A sequence is an AP, iff its n<sup>th</sup> terms is of the form An + B i.e., a linear expression in n. The common difference in such a case is A i.e., the coefficient of n.

### 1.2 Geometric Progression (GP)

GP is a sequence of numbers whose first term is non zero & each of the succeeding terms is equal to the proceeding terms multiplied by a constant. Thus in a GP the ratio of successive terms is constant. This constant factor is called the COMMON RATIO of the series & obtained by dividing any term by that which immediately proceeds it. Therefore a, ar,  $ar^2$ ,  $ar^3$   $ar^4$ , ..... is a GP with a as the first term & r as common ratio.

- (i)  $n^{th}$  term = a  $r^{n-1}$
- (ii) Sum of the I<sup>st</sup> n terms i.e.  $S_n = \frac{a(r^n 1)}{r 1}$ , if  $r \neq 1$ .
- (iii) Sum of an infinite GP when  $|\mathbf{r}| < 1$  when  $\mathbf{n} \to \infty$ ,

$$r^{n} \rightarrow 0 \text{ if } |r| < 1 \text{ therefore, } S_{\infty} = \frac{a}{1-r} (|r| < 1).$$

- (iv) If each term of a GP be multiplied or divided by the same non-zero quantity, the resulting sequence is also a GP.
- (v) Any 3 consecutive terms of a GP can be taken as a/r, a, ar ; any 4 consecutive terms of a GP can be taken as  $a/r^3$ , a/r, ar ar  $a^3$  & so on.
- (vi) If a, b, c are in  $GP \Rightarrow b^2 = ac$ .

#### **Properties of Geometric Progressions**

- 1. If all the terms of a GP be multiplied or divided by the same non-zero constant, then it remains a GP with the same common ratio.
- 2. The reciprocals of the terms of a given GP forms a GP.
- 3. If each term of a GP be raised to the same power, the resulting sequence also forms a G.P.
- 4. In a finite GP the product of the terms equidistant form the beginning and the end is always same and is equal to the product of the first and the last term.
- 5. Three non-zero numbers, a, b, c are in GP, if  $b^2 = ac$ .
- 6. If the terms of a given GP are chosen at regular intervals, then the new sequence so formed also forms a GP.
- If a<sub>1</sub>, a<sub>2</sub>, a<sub>3</sub>, ..., a<sub>n</sub>, .... is a GP of non-zero non-negative terms, then log a<sub>1</sub>, log a<sub>2</sub>, .... log a<sub>n</sub>, .... is an AP and vice versa.

### 2. MEANS

### 2.1 Arithmetic Mean

If three terms are in AP then the middle term is called the AM between the other two, so if a, b, c, are in AP, b is AM of a & c.

AM for any n positive number  $a_1, a_2, \dots, a_n$  is ;

 $A = \frac{a_1 + a_2 + a_3 + \dots + a_n}{n}$ 

### 2.2 n-Arithmetic Means between Two Numbers

If a, b are any two given numbers & a,  $A_1, A_2, \dots, A_n$ , b are in AP then  $A_1, A_2, \dots, A_n$  are n AM's between a & b.

$$A_{1} = a + \frac{b-a}{n+1}, A_{2} = a + \frac{2(b-a)}{n+1}, \dots, A_{n} = a + \frac{n(b-a)}{n+1}$$
$$A_{1} = a + d, A_{2} = a + 2d, \dots, A_{n} = a + nd, \text{ where}$$
$$d = \frac{b-a}{n+1}$$

Sum of n AM's inserted between a & b is equal to n times the single AM between a & b i.e.  $\sum_{r=1}^{n} A_r = nA$  where A is the single AM between a & b.

### 2.3 Geometric Mean

If a, b, c are in GP, b is the GM between a & c.  $b^2 = ac$ , therefore  $b = \sqrt{ac}$ ; a > 0, c > 0.

### 2.4 n-Geometric Means between a & b

If a, b are two given numbers & a,  $G_1, G_2, \dots, G_n$ , b are in GP. Then  $G_1, G_2, G_3, \dots, G_n$  are n GMs between a & b.  $G_1 = a (b/a)^{1/n+1} = ar$ ,  $G_2 = a (b/a)^{2/n+1} = ar^2$ , ....,  $G_n a (b/a)^{n/n+1} = ar^n$  where  $r = (b/a)^{1/n+1}$ 

Note...

The product of n GMs between a & b is equal to the nth power of the single GM between a & b i.e.  $\prod_{r=1}^{n} G_r = (G)^n$ where G is the single GM between a & b.

# 2.5 Arithmetic, Geometric and Harmonic means between two given numbers

Let A, G and H be arithmetic, geometric and harmonic means of two positive numbers a and b. Then,

$$A = \frac{a+b}{2}$$
,  $G = \sqrt{ab}$  and  $H = \frac{2ab}{a+b}$ 

These three means possess the following properties

- $1. \qquad A \ge G \ge H$
- 2. A, G, H form a GP i.e.,  $G^2 = AH$ .
- 3. The equation having a and b as its roots is  $x^2 2Ax + G^2 = 0$
- 4. If A, G, H are arithmetic, geometric and harmonic means between three given numbers a, b and c, then the equation having a, b, c as its roots is

🕀 www.studentbro.in

$$x^{3} - 3Ax^{2} + \frac{3G^{2}}{H}x - G^{3} = 0$$

### SEQUENCE AND SERIES

# Note ...

# Some important properties of Arithmetic & Geometric Means between two quantities

- 1. If A and G are respectively arithmetic and geometric means between two positive quantities a and b, then the quadratic equation having a, b as its roots is  $x^2 2Ax + G^2 = 0$ .
- 2. If A and G be the AM and GM between two positive numbers, then the number are  $\sqrt{2}$

 $A\pm\sqrt{A^2-G^2}.$ 

### **3. SIGMA NOTATIONS**

3.1 Theorems

(i) 
$$\sum_{r=1}^{n} (a_r \pm b_r) = \sum_{r=1}^{n} a_r \pm \sum_{r=1}^{n} b_r$$

- (ii)  $\sum_{r=1}^{n} k a_r = k \sum_{r=1}^{n} a_r$
- (iii)  $\sum_{r=1}^{n} k = k + k + k$ ..... n times = nk ; where k is a constant.

## 4. SUM TO n TERMS OF SOME SPECIAL SEQUENCES

4.1 Sum of first n natural numbers

$$\sum_{k=1}^{n} k = 1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}.$$

4.2 Sum of the squares of first n natural numbers

$$\sum_{k=1}^{n} k^{2} = 1^{2} + 2^{2} + \dots + n^{2} = \frac{n(n+1)(2n+1)}{6}.$$

4.3 Sum of the higher powers of first n natural numbers

$$\sum_{k=1}^{n} k^{3} = 1^{3} + 2^{3} + \dots + n^{3} = \left(\frac{n(n+1)}{2}\right)^{2} = \left(\sum_{k=1}^{n} k\right)^{2}$$

$$\sum_{k=1}^{n} k^{4} = \frac{n}{30}(n+1)(2n+1)(3n^{2}+3n-1)$$
  
4.4 Sum of first n odd numbers  
$$\sum_{k=1}^{n} (2k-1) = 1+3+...+(2n-1) = n^{2}$$

### **5. ARITHMETICO-GEOMETRIC SERIES**

A series each term of which is formed by multiplying the corresponding term of an AP & GP is called the Arithmetico-Geometric Series. e.g.  $1 + 3x + 5x^2 + 7x^3 + \dots$  Here, 1, 3, 5, ...... are in AP & 1, x,  $x^2$ ,  $x^3$  ...... are in GP.

### 5.1 Sum of n terms of an Arithmetico-Geometric Series

Let 
$$S_n = a + (a + d) r + (a + 2 d) r^2 + \dots + [a + (n - 1) d] r^{n-1}$$

then 
$$S_n = \frac{a}{1-r} + \frac{dr(1-r^{n-1})}{(1-r)^2} - \frac{[a+(n-1)d]r^n}{1-r}, r \neq 1.$$

5.2 Sum to Infinity

If 
$$|\mathbf{r}| < 1$$
 &  $\mathbf{n} \to \infty$   
then  $\underset{n \to \infty}{\text{Limit } \mathbf{r}^n} = 0$ .  $\mathbf{S}_{\infty} = \frac{\mathbf{a}}{1 - \mathbf{r}} + \frac{\mathbf{dr}}{(1 - \mathbf{r})^2}$ 

### 6. HARMONIC PROGRESSION (HP)

A sequence is said to HP if the reciprocals of its terms are in AP.

If the sequence  $a_1$ ,  $a_2$ ,  $a_3$ , ...,  $a_n$  is an HP then  $1/a_1$ ,  $1/a_2$ , ...,  $1/a_n$  is an AP & converse. Here we do not have the formula for the sum of the n terms of an HP. For HP whose first terms is a & second term is b, then n<sup>th</sup>

term is 
$$t_n = \frac{ab}{b + (n-1)(a-b)}$$

If a, b, c are in HP  $\Rightarrow$  b =  $\frac{2ac}{a+c}$  or  $\frac{a}{c} = \frac{a-b}{b-c}$ .

### 7. HARMONIC MEAN

If a, b, c are in HP, b is the HM between a & c, then b = 2ac/[a + c].]
