Co-ordination Compounds

$Salt_{1(aq.)} + Salt_{2(aq.)} \xrightarrow[\text{Add}^n \text{ Rxn}]{\text{cryst.}} \underset{\text{(Adduct)}}{\text{Add}^n \text{ cmpd.}}$

- $KCl_{(aq.)} + MgCl_{2(aq.)} \xrightarrow[\Delta]{\text{cryst}} KCl \cdot MgCl_2 \cdot 6H_2O \xrightarrow{H_2O}$ completely ionize K^+, Cl^-, Mg^{2+}

  Carnellite

- $CuSO_4 + 4NH_3 \longrightarrow CuSO_4 \cdot 4NH_3$
- $4KCN + Fe(CN)_2 \longrightarrow 4KCN \cdot (Fe(CN)_2) \xrightarrow{H_2O}$ completely ionize K^+, Fe^{2+}, CN^-

* Types of Addition compound :

1] Double salt :- which ionise completely in aq. medium. All ions show their presence in aq. medium

	Type of ions in aq.	No. of ions
A) Carnellite $KCl \cdot MgCl_2 \cdot 6H_2O$	3 (K^+, Mg^{2+}, Cl^-)	5
B) Mohr's salt $FeSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$	3 ($Fe^{2+}, SO_4^{2-}, NH_4^+$)	5
c) Alums ↓	3 (X^+, Y^{3+}, SO_4^{2-})	8

General formula ⇒ $X_2SO_4 \cdot Y_2(SO_4)_3 \cdot 24H_2O$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

$\Rightarrow XY(SO_4)_2 \cdot 12H_2O \quad \Rightarrow [X(H_2O)_6]^+ [Y(H_2O)_6]^{3+} (SO_4)_2$

$X^+ \Rightarrow$ ~~A^+~~, Na^+, K^+, Rb^+, Cs^+, NH_4^+

$Y^{3+} \Rightarrow Cr^{3+}, Fe^{3+}, Al^{3+}$

Q. Find the formula of an Alum which gives following observation :

i) gives ppt with $BaCl_2$ ($BaSO_4$)

ii) gives a volatile product & coloured ppt when reacted with NaOH ($Y^{3+} = Cr^{3+}, Fe^{3+}$)

iii) gives a volatile product & coloured sol^n when reacted with Na_2O_2 ($+ = NH_4^+$)

($NH_4Cr(SO_4)_2 \cdot 12H_2O$)

Also find the colour of sol^n when it reacts with excess Na_2O_2.

$\longrightarrow NH_4Cr(SO_4)_2 \cdot 12H_2O$; Yellow

2] Complex Salt :- does not ionise completely in aq. medium. some of the ions lose their identity in aq. medium.

	Type of ions in aq. medium	No. of ions in aq. med.
A) $K_4KCN \cdot Fe(CN)_2$ $= K_4[Fe(CN)_6]$		

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Theo. $3(K^+, CN^-, Fe^{3+})$ 11

Pract. $2(K^+ [Fe(CN)_6]^{4-})$ 5

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- Charge on complex is sum of O.S. of C.M.I & ligands
- Space in 3-D where co-ordinate bond form b/w ligand & C.M.I is called co-ordination sphere.
- Simple ions which ionic bond with complex ion are called counter ions.
- Space in 3-D where complex ion forms ionic bond with opp. charge ions is called ionization sphere.
- Species in co-ordin^n sphere is non-ionisable while species in ionisation sphere is ionisable.
- Geometry around C.M.I is called co-ordination polyhedra.
  Eg, tetrahedral (4), Sq. planar (4).
- Species in sq. bracket represent co-ordination entity.
- Co-ordination no. is property of CMI, no. of co-ordinate bond formed by CMI is called its C.N°.

+3 O.S. of 3d series = 6 always
+2 O.S. of 3d series = 4/6
Ni^{2+} (OH_2 / NH_3) = 6
(Cl^- / CN^-) = 4

Get More Learning Materials Here : CLICK HERE www.studentbro.in

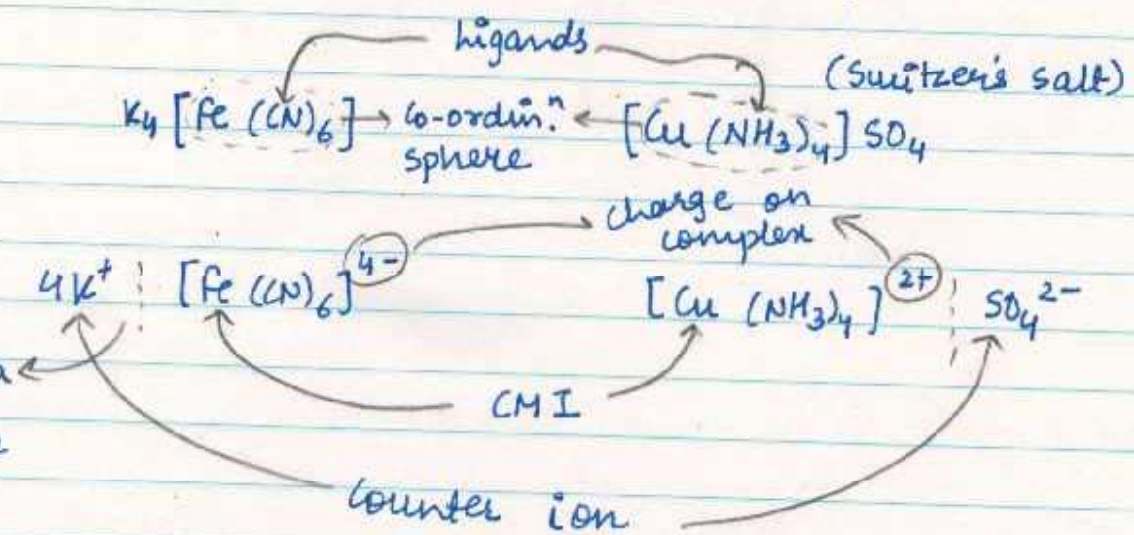
* Basic Terminology :→

- Ions which lose their identity in aq. sol^n are written in square bracket are called complex ions & compound containing such ions are called complex compound.

- In complex ion atleast one metal ion is present which is centre of complex ion, acts as lewis acid is called central metal ion [CMI].

- CMI is surrounded by neutral molecule and ions which act as lewis base and are called ligands.

- Complex formation is a lewis acid-base rxn in which co-ordinate bond is present b/w CMI & ligands, thats why, complex cmpds are also known as co-ordination compounds.



Get More Learning Materials Here : CLICK HERE www.studentbro.in

* Classification of ligands :

1) On the basis of charge :

Cationic	Anionic	Neutral
-ium suffix is used	ide → ido	- Common name except
NO^+ → Nitrosylium / Nitrosonium	ite → ito	H_2O → aqua
$N_2H_5^+$ → Hydrazinium	ate → ato	NH_3 → ammine
	SO_4^{2-} → Sulphato	CO → Carbonyl
	O^{2-} → oxido	NO → Nitrosyl
	SO_3^{2-} → Sulphito	C_6H_6 → benzene
	$C_6H_5^-$ → phenyl	PH_3 → Phosphene
	CH_3^- → methyl	

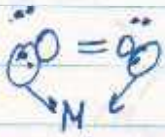
2) On the basis of denticity :

- Having one donor site = monodentate

Eg : $H^-, F^-, Cl^-, Br^-, I^-, H_2O, OH^-, NH_3, NH_2^-, NH^{-2}$

- Having two donor site

A) form three membered ring with CMI = Monodentate



3-membered ring
Angle strain & (unstable)

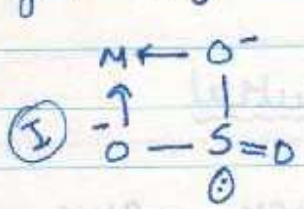
$M \leftarrow O=O$
Stable

Eg : CN^-, SCN^-

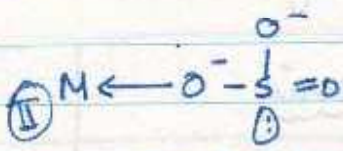
Get More Learning Materials Here : CLICK HERE www.studentbro.in

B] Form four membered ring with CMI

eg : SO_3^{2-}



(I) • Stable in comp. of 3-m ring but unstable due to angle strain.



(II) • More stable in comp. of 1st structure.

Such ligands are called flexident coz they show variable denticity, as per requirement of C. No. of central metal ion they can act as bidentate ligand.

$[Cr(NH_3)_5 SO_4]Br$ ← Monodentate

$[Cr(NH_3)_4 SO_4]$ ← Bidentate

C] Form 5/6/7 membered ring are called bidentate/didentate

• (en) ethylenediamine (ethane + 2 diamine)

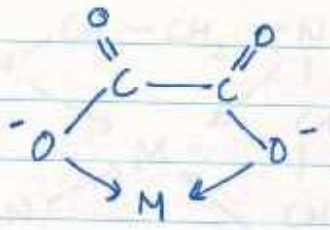
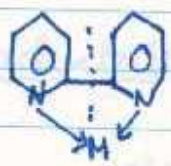
- (ox^{-2}) Oxlato $C_2O_4^{2-}$



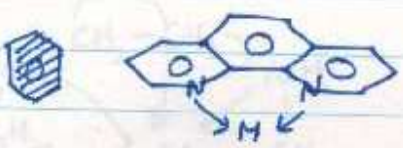
symm.

- dipyridine (dipy)



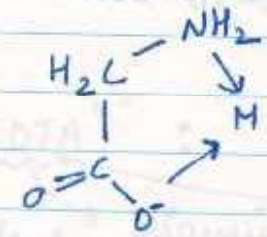
symm.

- Phenanthrolene (Phen)



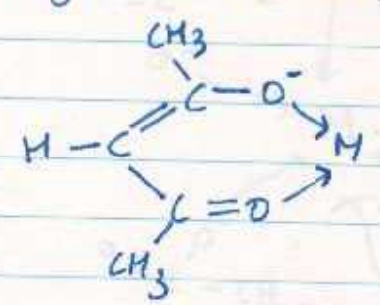
symm.

- glycinato (gly^-)



Unsymm.

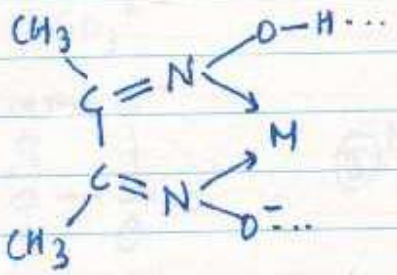
- Acetylacetonato ($acac^-$)



Symm.

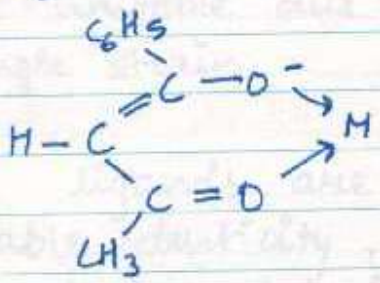
Get More Learning Materials Here : CLICK HERE www.studentbro.in

- dimethylglyoximato (dmg$^-$)



Unsymm.

- benzylacetonato (bcac$^-$)



Unsymm.

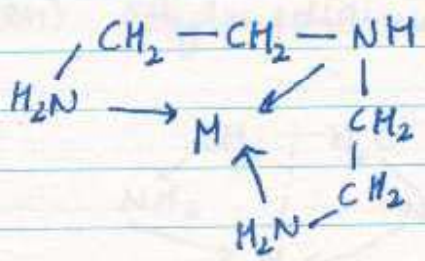
- having,

3 donor site → tridentate
4 donor site → tetradentate
5 donor site → pentadentate
6 donor site → Hexadentate

} Polydentate

eg,

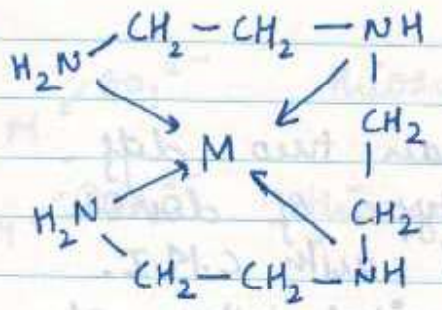
dien (diethylene tri amine)



tridentate

Get More Learning Materials Here : CLICK HERE www.studentbro.in

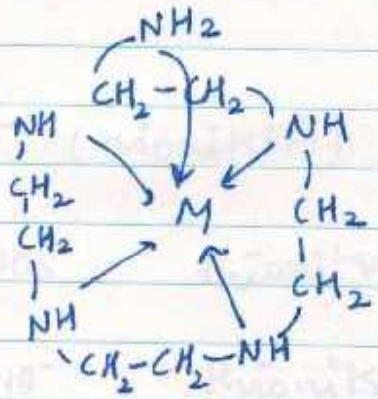
trien (triethylene tetra amine)



tetradentate

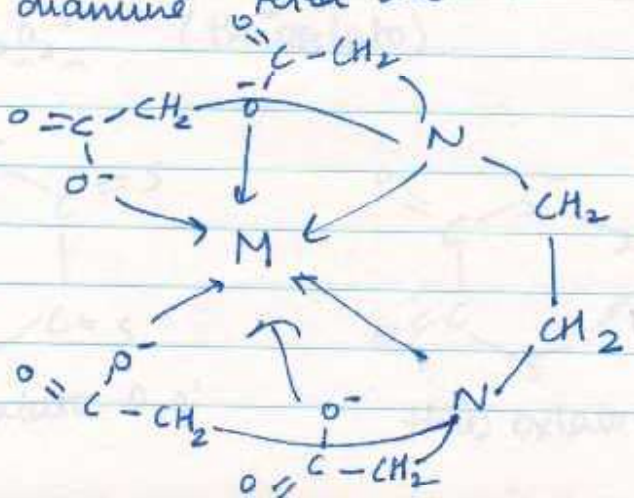
- **Pentadentate (teten) :**

tetra ethylene penta amine



- **EDTA^{4-} :**

ethylene diamine tetra acetato



∠MND = 8

Get More Learning Materials Here : CLICK HERE www.studentbro.in

• Special case :

1] Ambidentate ligands :

-ve

• ligands having two or more than two diff. donor site but uses only one type of donor site at a time when co-ordinated with C.M.I.
• In naming of such ligands, capital letter of donor site is written as suffix.

a) CN^- $[:C\equiv N:]^-$

$M \leftarrow C\equiv N^-$ cyanido - C

$M \leftarrow N\equiv C^-$ cyanido - N

b) SCN^- $[\ddot{S}=C=\ddot{N}]^-$

$M \leftarrow SCN^-$ thiocyanato - S

$M \leftarrow NCS^-$ thiocynate - N

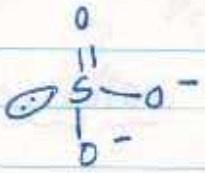
c) OCN^-

$M \leftarrow OCN^-$ cyanato - O

$M \leftarrow NCO^-$ cyanato - N

Get More Learning Materials Here : CLICK HERE www.studentbro.in

d) SO_3^{2-}



M ← SO_3^{2-} thiosulphato - S

M ← OSO_2^{2-} thiosulphato - O

e) NO_2^-

M ← NO_2^- Nitrito - N / Nitro

M ← ONO^- Nitrito - O / Nitrito

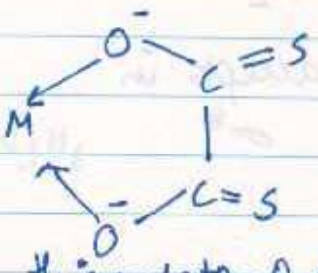
f) NOS^- (thionitrito)

M ← NOS^- thionitro - N

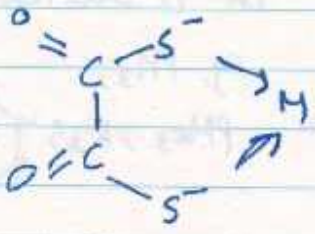
M ← SNO^- thionitro - S

M ← ONS^- thionitro - O

g) $C_2S_2O_2^{2-}$ (thioxlato)



thio oxlato - O, O'



thio oxlato - S, S'

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. Calculate denticity of :

i] $[N(CH_2COO)_3]^{3-}$ 4

NTA^{3-}

ii] $[N(CH_2-CH_2NH_2)_3]$ 4

* Classification of ligands on the basis of bonding pattern :

- Classical
  - (only donor)
  - $M \leftarrow L$
  - H^-, F^-, ~~Cl^-~~, ~~Br_2~~, H_2O, OH^-, NH_3, NH_2^-, NH^{-2}, O^{-2}, N^{-3}, en
  - (2^{nd} pd. donor atom per π bond nahi hona chahiye)
- Non-classical
  - (donor as well as acceptor)
  - π-acid ligands
  - $M \leftarrow\!\!\circlearrowright L$ synergic bonding
    - l.p. / σ donor, π acceptor
      - accepts e^- in π^* (having π bond on donor atom)
      - accepts e^- in d orbital eg. PH_3, PMe_3, R_2S
      - H_2 accepts in σ^*
    - π donor, π acceptor

Get More Learning Materials Here : CLICK HERE www.studentbro.in

* π-donor, π-acceptor :

- They are not lewis base but they act as ligand in complex formation coz they share their π-e⁻ with vacant orbital of metal & accept e⁻s from filled d-orbital of metal into their vacant π*. So due to synergy metal ligand B.O.↑ as a ligand their stability ↑. Such ligands are written with prefix,

η^x where,

x → hapticity of ligand (no. of donor atoms participating in donation)

ligand	Bonding Pattern	no. of e⁻ in do.	name
• C_2H_4		2	η^2-ethylene / π-ethylene
• $CH_2=CH-CH=CH_2$		4	η^4-butadiene / π-butadiene
• C_6H_6		6	η^6-benzene / π-benzene
• $B_3N_3H_6$		6	η^6-borazine / π-borazine

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- $C_5H_5^-$ (cyclopentadienyl) (cp)

a)  — 2 — η^1-cp / σ-cp

b)  — 4 — η^3-cp

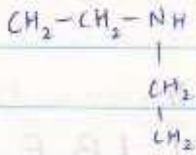
c)  — 6 — η^5-cp / π-cp

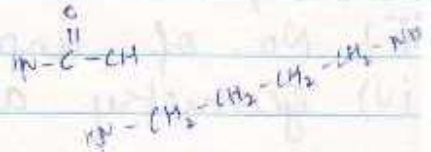
- $C_3H_5^-$
  - allyl $CH_2=CH-CH_2^-$
    - a) $M \leftarrow \bar{C}H_2-CH=CH_2$ — 2 — η^1-allyl / σ-allyl
    - b) $CH_2=CH=CH_2$ (M coordinated) — 4 — η^3-allyl / π-allyl
  - cyclopropyl

 η^1-cyclopropyl (2)

Q. Matrix Match

A) gly^-	i) same donor atoms
B) dipy	ii) diff. donor atoms
c) bn	iii) optically active
D) pn	iv) forms 5-membered ring
	v) unsymmetrical bidentate





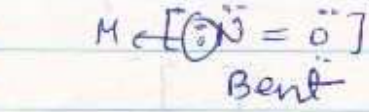
→ c → i ; iii , iv)
A → ii ; iv ; v ;
B → i ; iv ;
D → i ; iii ; iv ; v

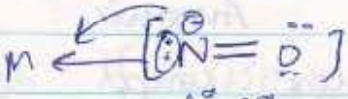
* On the basis of fixed & variable charge :

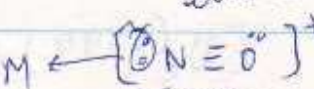
1] Innocent ligand : Having fixed O.S.
eg, Cl^-, OH^-, H_2O, NH_3, etc.

2] Non-innocent ligand : Can show diff. diff. O.S
eg. $(O_2) \rightarrow O_2$, O_2^-, O_2^{2-}

$(NO) \rightarrow \underbrace{NO, NO^+}_{M}, \underbrace{NO^-}_{2}$







Get More Learning Materials Here : CLICK HERE www.studentbro.in

They can be distinguished by,

i) B.O.
ii) B.L / B.E.
iii) No. of unpaired e^-
iv) Geometry around donor site.

eg. NO_2^- ONO^- { NO_2^- is an innocent ligand }

Tri. Planar Bent

v) Long" of central metal ion
vi) V.P e^- of CMI
vii) O.S of CMI

Q $K_2[Zn(CN)_2(O_2^-)_2] \xrightarrow{\text{Reagent}} [Zn(CN)_2(O_2^\circ)_2]$

Find diff in no of m— b/w I & II

$\longrightarrow 1 \times 2 = 2$

* Classification of Complexes :

i] On the basis of Charge,

$[\,]^+$ $[\,]^-$ $[\,]^\circ$
cationic Anionic neutral

So complex cmpd can be

Get More Learning Materials Here : CLICK HERE www.studentbro.in

i] Simple cation + complex anion

ii] complex cation + simple anion

iii] complex anion + complex anion

iv] Neutral complex

eg of i)

a) Fischer's salt $K_3[Co(NO_2)_6]$
(Yellow ppt)

b) Sodium nitro prusside $Na_2[\overset{+2}{Fe}(CN)_5\overset{+1}{NO}]$

$\rightarrow [Fe(CN)_5X]^{-n}$

eg of ii)

a) Browning complex $[Fe(H_2O)_5NO]SO_4$

eg of iii)

a) $[Cr(NH_3)_6][Co(NO_2)_6]$

eg of iv)

a) cis-platin (anticancer) $cis-[Pt(NH_3)_2Cl_2]$

b) Wilkerison catalyst $[Rh(PPh_3)_3Cl]$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

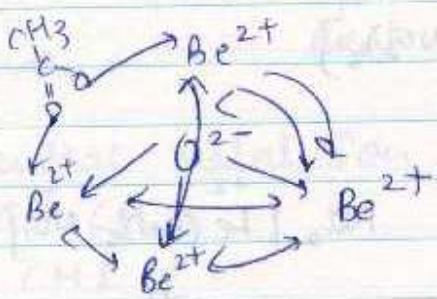
ii] On the basis of no. of CMI

a) Mononuclear : Having one CMI

eg. cis-platin

b) bi/polynuclear : Having more than one CMI

eg. $[Be_4O(CH_3COO)_6]$



iii] On the basis of types of ligand

a) Homoleptic : only one type of ligand

b) Heteroleptic : more than one type of ligand

iv] on the basis of donation of ligands

A) σ complexes : Having only lone pair donor

cis-platin

Get More Learning Materials Here : CLICK HERE www.studentbro.in

B] π- complexes : Having atleast one π donor

eg.

- $Cr(C_6H_6)_2$ - ferrocene $Fe(C_5H_5)_2$ - Zeise's salt $K[PtCl_3(\eta^2-C_2H_4)]$ 
C_2H_4 & $PtCl_3$ plane is ⊥ar to each other

v] On the basis of stability :

$$M^{+x} + nL \rightleftharpoons [ML_n]^{+x}$$

$K_s / K_f = \frac{[ML_n^{+x}]}{[M^{+x}][L]^n}$

K_s ↑ stability constant

K_f ↑ forward reaction ↑ stability of complex ↑ Conc. of simple ions ↓

a) Perfect complex : Stable in presence of particular reagent.
Having high value of K_f.

b) Imperfect complex : Unstable in presence of particular reagent.
Having low value of K_f

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- $CuSO_4 + KCN \longrightarrow \overset{+2}{Cu}(CN)_2 + K_2SO_4$

DPP # 6
Q.1 → 30

Matrix, Imperfect in presence of

A] $[Ag(H_2O)_2]^+$ P) Cl^-

B] $[Ag(NH_3)_2]^+$ Q) Br^-

C] $[Ag(S_2O_3)_2]^{3-}$ R) I^-

D] $[Ag(CN)_2]^-$ S) S^{2-}

T) None of these

→ A - P, Q, R, S
B - ~~P,~~ ~~Q~~ R, S or Q, R, S
C - ~~P/Q/R/S~~ S
D - ~~P/Q/R/S~~ T

- Chelating ligands :→ those who form ring like structure with CMI (bidentate, polydentate) Ring formation is called chelation.

- Bridging ligands :→ In polynuclear complexes, ligands joins two or more than two CMI. Such ligands are written with μ_n prefix where n = no. of CMI which are directly bonded with a ligand.

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. 
→ • dichloridoplatinate (II) di-μ-amido-dichloridoplatinate (II)
• di-μ-amido bis(dichloridoplatinate (II))
• di-μ-amido tetrachloridodiplatinate (II)
• bis-μ-amido dichloridoplatinate (II)

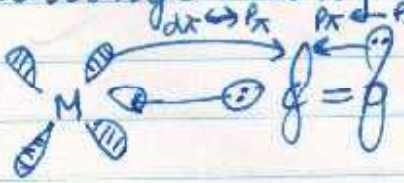
* Synergic Bonding :
↳ give & take

M ⇄ L
↳ π-acid ligands

i] in metal carbonyls ($M(CO)_x$:→

Acc" to VBT,

:C≡O:
BO = 3 EN C<O
donor site 'C'
more EN 'O' donates l.p. to less EN 'C'.
in carbonyl complexes



EN, M < C < O

Get More Learning Materials Here : CLICK HERE www.studentbro.in

'C' ko e^- lene mai maja metal se jyada aayega, jaise metal se donation ↑ hoga 'O' apna l.p. withdraw kar lega, metal-C BO ↑

CO BO ↓

CO BE ↓ CO BL ↑

$1 < BO_{MC} < 2$

$2 < BO_{CO} < 3$

Acc^n to MOT

NBMO of 'C' → :C O: ← NBMO of 'O'

BO = 3, $14\ e^-$ system

energy of NBMO of 'C' > energy of NBMO of 'O'
so donor atom is 'C'.

HOMO of CO is σ_{NBMO} having slight AB ch^r
LUMO of CO is π^* having 100% AB ch^r

due to donation, BO of CO ↑ slightly
due to acceptance, BO of CO ↓ rapidly
So, due to synergic bonding
Net CO BO ↓ $2 < CO\ BO < 3$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. If CO BO in $Cr(CO)_6$ is x then comment on CO BO in

A) CO $> x$

B) $BH_3 \leftarrow CO$ $> x$

C) $Cr(CO)_6^+$ $> x$

D) $Cr(CO)_6^-$ $< x$

E) $V(CO)_6^-$ $< x$

F) $Mn(CO)_6^+$ $> x$

G) $[Cr(CO)_5(NH_3)]$ $< x$ → Classical one lp. decdr. b/w 5 CO

H) $[Cr(CO)_5PF_3]$ $> x$

I) $[Cr(CO)_5PCl_3]$ $< x$

Acceptance tendency of

$PF_3 > CO > PCl_3$

Practical evidence of CO BL / stretching freq. Method :

As strength of spring ↑

to stretch string required energy ↑

$E = h\nu$

Stretching frequency (ν) ↑

As like spring,

As CO BO ↑

CO BE ↑

Stretching frequency of CO ↑

Get More Learning Materials Here : CLICK HERE www.studentbro.in

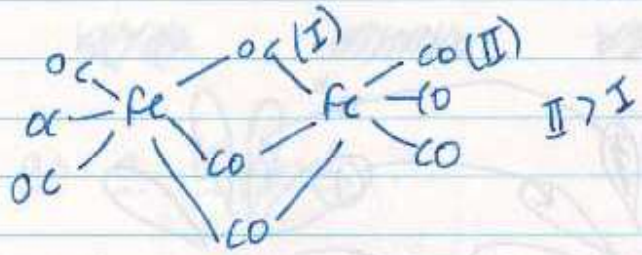
Q. Compare stretching frequency of CO

A) $Cr(CO)_4 > Cr(CO)_4^-$

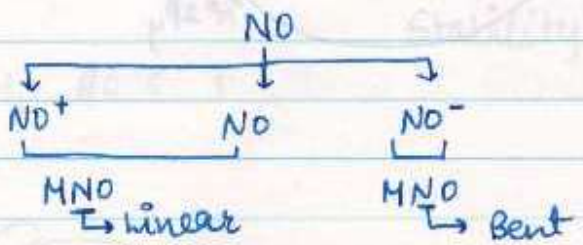
B) $[Cr(CO)_5PF_3] \gtrsim [Cr(CO)_5PH_3] \gtrsim [Cr(CO)_5PMe_3]$

C) $[Cr(CO)_6] > [Cr(CO)_5NH_3] > [Cr(CO)_4(en)]$

D)



* NO as a ligand :



• How to distinguish b/w NO & NO^+

eg ⇒ Brown ring complex $[Fe(H_2O)_5NO]SO_4$

- Fe^{2+} NO 2V (unstable)
- Fe^{+} NO^+ ≈0V (stable)

Sodium nitroprusside $Na_2[Fe(CN)_5NO]$

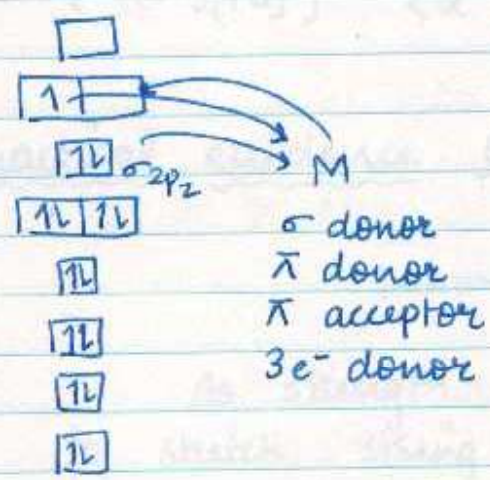
- Fe^{3+} NO 3V (unstable)
- Fe^{2+} NO^+ 1V (stable)

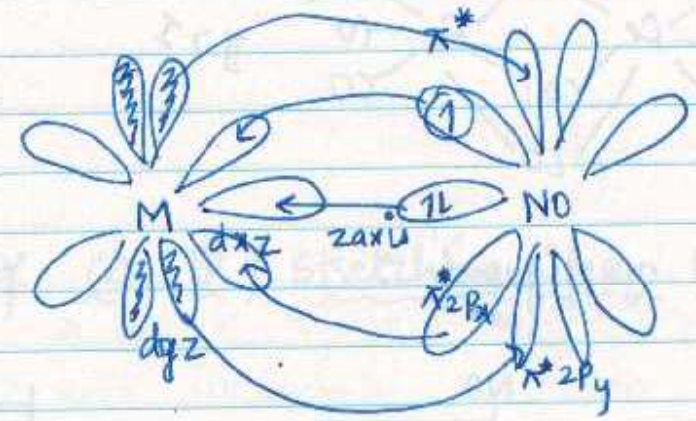
Get More Learning Materials Here : CLICK HERE www.studentbro.in

- $Cr(NO)_4$ — Cr NO $\approx 0V$ (stable)
  Cr^{4-} NO^+ $5V$ (unstable)
- $Fe(CO)_2(NO)_2$ — Fe° NO $4V$ (stable)
  Fe^{2-} NO^+ $3V$ (unstable)

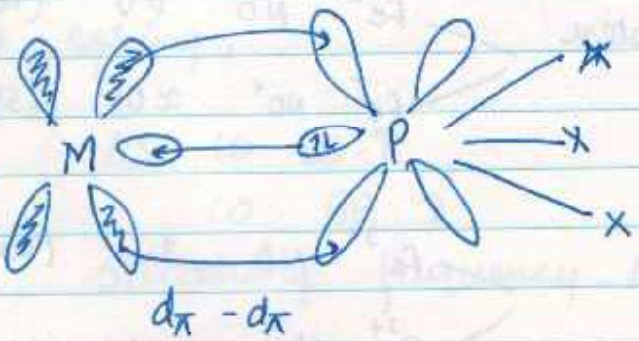
→ Synergic bonding in $M{-}NO$ (o)

NO 15e⁻





→ Synergic bonding in PX_3, SX_2, AsX_3



$d_\pi - d_\pi$

No change in P-X BO due to synergy because e⁻ from metal ion enters in vacant d-orbital of 'p' not in σ* of P-X bond.

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. compare stretching frequency of CO

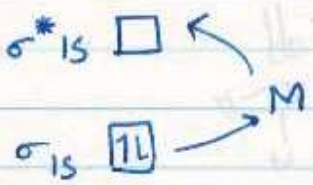
$M(CO)_x$ (cyclopropyl) (a)

$M(CO)_x$ (π-allyl) (c) 4 e⁻

$M(CO)_x$ (σ-allyl) (b)

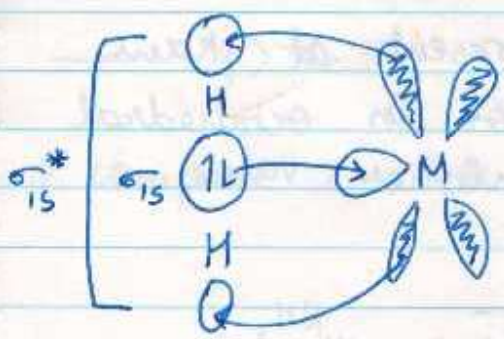
→ [redacted] c > b > a

→ H_2 as a ligand.



H_2 as a ligand stable when good acceptor present in complex, So e⁻ cloud in σ^* of H_2 ↓, Stability of H_2 ↑

$0 < H_2$ BO < 1



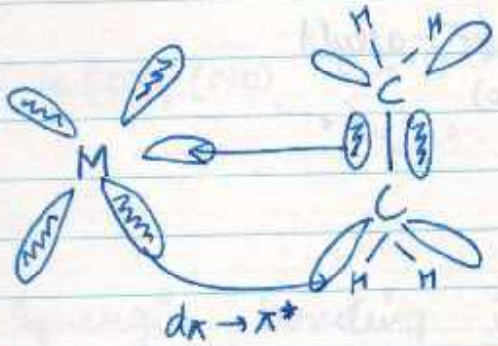
$Mo(CO)_5 H_2 \leftarrow H_2$

$Mo(CO)_2(PMe_3) H_2 \leftarrow H^-$

acceptance of CO > PMe_3 tendency

Get More Learning Materials Here : CLICK HERE www.studentbro.in

* C_2H_4 as a ligand



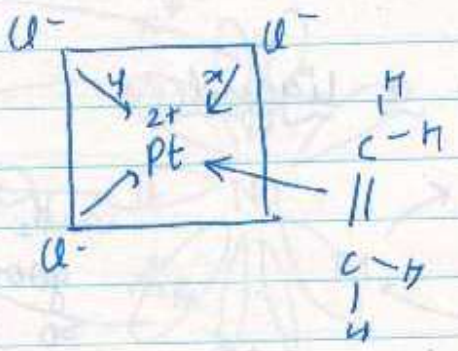
example :→

Zeise's salt

$K[PtCl_3(\eta^2-C_2H_4)] \cdot H_2O$

first compound observed which has π-donor ligand.

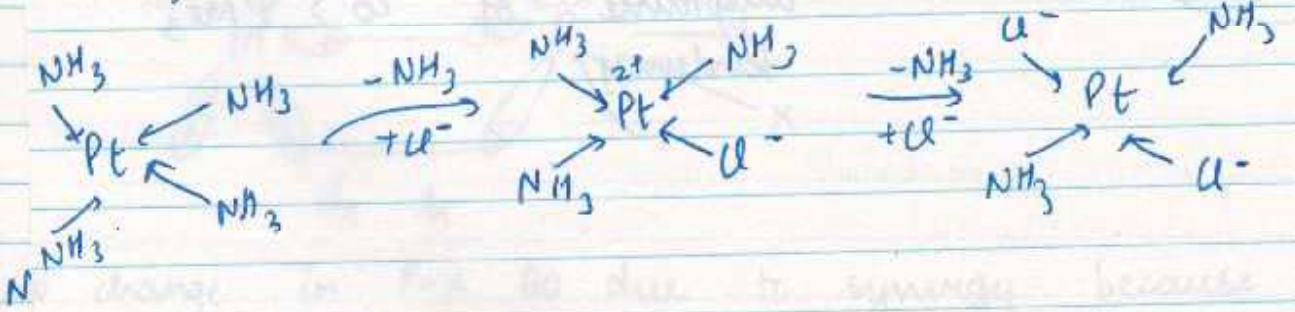
- $PtCl_3$ & C_2H_4 plane are ⊥er to each other
- C_2H_4 is not planar
- All H atoms are in a plane but not with 'C' atoms due to rep^n b/w $d\pi \rightarrow \pi^*$ & C–H σ bond



BL y > x

due to trans effect

trans effect :→ when strong a.c. present at trans position in sq. planar or in octahedral geometry M-Ligand BL has higher value from its expected value.



Get More Learning Materials Here : CLICK HERE www.studentbro.in

• $PtCl_4^{2-} \xrightarrow[-Cl^-]{+NH_3}$  $\xrightarrow[-Cl^-]{+NH_3}$ 
Q. Draw possible correct structure of
$M(CO)_2(CN)_2(NH_3)_2Cl$
If two type of stretching frequency obtained for CN^- & one type of stretching frequency obtained for CO.

→ 
Q. If difference in C-C Bl in C_2H_4 & $K[PtCl_3(C_2H_4)]$ is x & in C_2F_4 & $K[PtCl_3(C_2F_4)]$ is y. then compare x & y

→ $y > x$ C_2F_4 is better acceptor than C_2H_4

Q. Compare C-C Bl in • $C_5H_5^-$ & ferrocene
• C_6H_6 & $Cr(C_6H_6)_2$

→ $C_6H_6 < Cr(C_6H_6)_2$

$C_5H_5^- <$ ferrocene

Get More Learning Materials Here : CLICK HERE www.studentbro.in

* Organo metallic compounds : When metal forms covalent / coordinate bond with C, B, Si such compounds are called organo metallic compounds.

- Cyanide salts & ionic carbide are not organo metallic compounds.

* WERNER'S THEORY :→

Acc" to him, CMI shows two types of valency,
i) Primary Valency (PV)
ii) Secondar valency (SV)

PV	SV
• O.S. of CMI	• C.N. of CMI
• Satisfied by anions.	• Satisfied by anions / neutral molecules (ligands)
• Form ionic bond	• Co-ordinate bond
• Generally ionisable	• Non-ionisable
• Non-directional	• Directional
• Satisfied by represented by dotted (- - -) line	• by solid (—) line

Note :
1) anionic ligands are represented by solid with dotted line. If nothing is specified, always consider neutral ligands inside cordination sphere in conversion of weaner's formula into modern formula

Get More Learning Materials Here : CLICK HERE www.studentbro.in

	$Pt \cdot 4NH_3 \cdot Cl_2$	$Pt \cdot 3NH_3 \cdot Cl_2$
	$[Pt(NH_3)_4]Cl_2$	$[Pt(NH_3)_3Cl]Cl$
		PV	2	2
SV	4	4
electrolyte	1:2 (cation : anion)	1:1
cond.	>	
ppt with excess $AgNO_3$	2 mol	1 mol

- Application of Werner's theory :

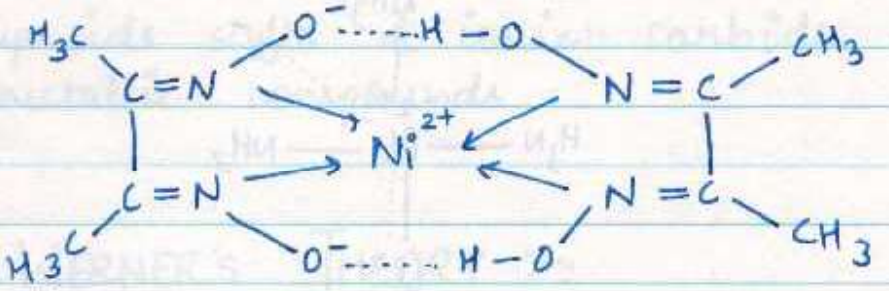
i] to predict exact formula of each complex.

ii] to predict the structure of diff. complexes with C.N. 4 & 6.

eg : $[Cr(NH_3)_4Cl_2]Cl$ → 2 isomers

Get More Learning Materials Here : CLICK HERE www.studentbro.in

* $Ni^{2+} + dmg^- \longrightarrow Ni(dmg)_2 \downarrow$
Rosy red



* E.A.N (Effective Atomic Number) :-

- Total no. of es^- in CMI after complex formation.

Q.

1. $[Sc(H_2O)_6]^{3+}$ = 30
2. $[Ti(CO)_6]^{2-}$ = 36
3. $[VO_4]^{3-}$ = 96
4. $[Cr(NH_3)_6]Cl_3$ = 33
5. $[Mn(en)_3]SO_4$ = 29+6
6. $K_3[Fe(C_2O_4)_3]$ = 35
7. $Co(gly)_3$ = 36
8. $[Ni\ EDTA]^-$ = 40
9. $[Ag(CN)_2]^-$ = 50
10. $CuCl_4^{2-}$ = 35
11. $[Zn(acac)_2]$ = 32+4
12. HgI_4^{2-} = Hg+6 = 86
13. $[Pt(en)(dien)NH_3]^{4+}$ = Pt+8

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Sidgwick EAN Rule (as like octet rule) :

Acc" to sidgwick, complexes having EAN equal to next inert gas atomic no. are more stable in comparison of other complexes having EAN not equal to next inert gas A.N.

- complex follows EAN rule means, EAN of CNI is equal to next inert gas A.N.,

  $3d \rightarrow 36$

  $4d \rightarrow 54$

  $5d \rightarrow 86$

- EAN rule is also called $18e^-$ rule due to 18 valence shell es^-,

  $(n-1)d^{10}\ ns^2\ np^6$

  which is conf" of next inert gas atomic no.

- This rule is applicable for metal carbonyls & π-complexes.

* Metal carbonyls :

EAN

Oxidising agent

- 33 → tetramerize
- 34 → trimerize
- 35 → dimerize
- 36 → Stable
- 37 → Reducing agent

In presence of SFL, es^- are forced to pair as per requirement of d-orbitals for hybridisation. Due to pairing of es^- value of spin only Magnetic moment ↓ such complexes are called low spin complexes, in presence of WFL, no change in no. of unpaired es^- so they have high value of spin only magnetic moment in comparison of low spin complexes such complexes are called high spin complexes. (low spin w.r.t ground state)

Note: High spin & low spin complexes are defined only when ligands effect in that configuration occurs.

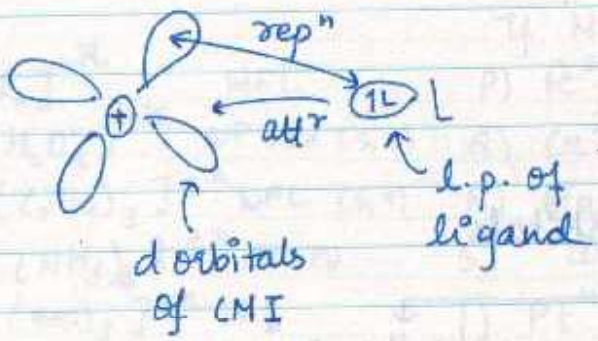
* Crystal Field Theory (CFT) :

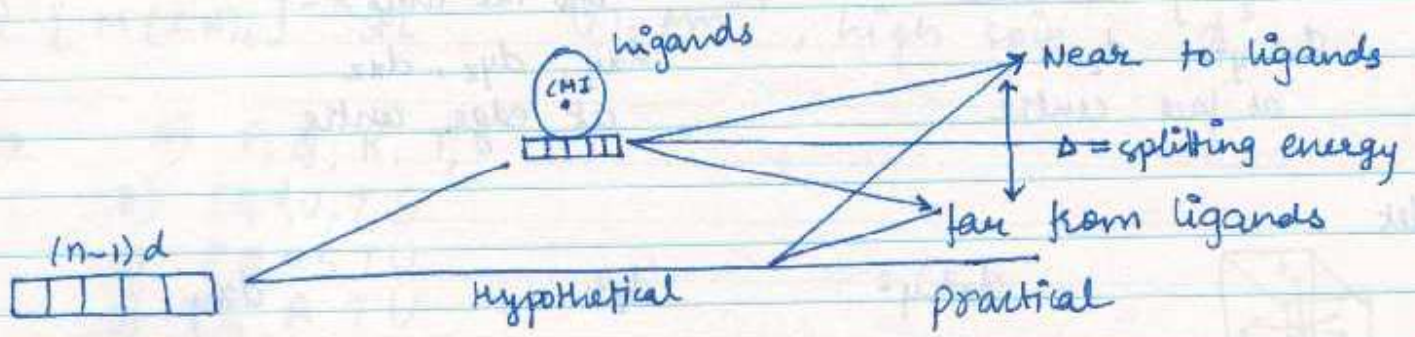
Acc. to CFT,

CMI = point charge

Ligands → Neutral = dipole
→ Anionic = -ve point charge

Interaction b/w ligand & CMI = electrostatic





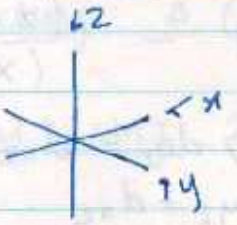
ligands are equally near to all d-orbitals

- When ligand approaches CMI in a particular geometry some of the d-orbital exp. more rep^n as compared to other d-orbitals or they are near to ligands

Get More Learning Materials Here : CLICK HERE www.studentbro.in

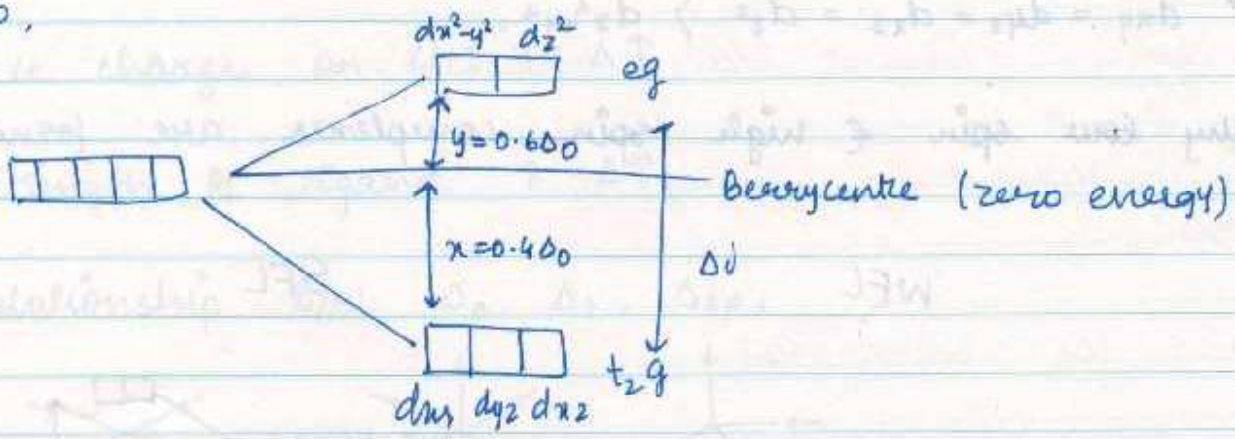
as compared to other d-orbitals. So, d-orbitals are splitted into diff. energy set, loss of degeneracy of d-orbitals is called crystal field splitting & energy diff. b/w them is called splitting energy (Δ).

- Splitting in Octahedral :



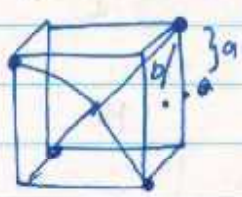
ligands are near to anial d-orbitals and far from non-anial d-orbitas

So,



$d_z^2 = d_{x^2-y^2} > d_{xy} = d_{yz} = d_{xz}$

- in tetrahedral :



b)a

ligands are near to non anial d-orbitals

$d_{xy} = d_{yz} = d_{xz} > d_{x^2-y^2} = d_z^2$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- in Sq. planar :

$d_{x^2-y^2} > d_{xy} > d_{z^2} > d_{yz} = d_{xz}$

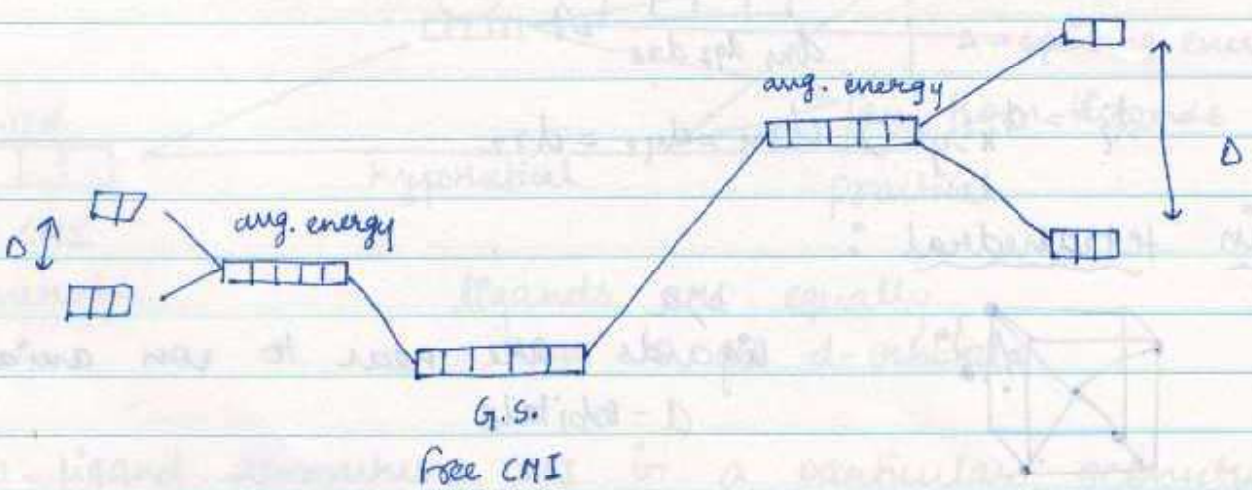
In xy plane

equall ⊥

- sp ⇒ $d_{z^2} > d_{yz} = d_{xz} > d_{x^2-y^2} = d_{xy}$ (z axis) (xy Plane)
- sp^2 ⇒ $d_{x^2-y^2} = d_{xy} > d_{z^2} > d_{yz} = d_{xz}$
- dsp^3 (TBP) ⇒ $d_{z^2} > d_{x^2-y^2} = d_{xy} > d_{yz} = d_{xz}$
- dsp^3 (S.P) ⇒ $d_{x^2-y^2} > d_{z^2} > d_{xy} > d_{yz} = d_{xz}$
- square antiprismatic ⇒ ~~$d_{z^2} \neq d_{x^2-y^2} > d_{xy} = \neq d_{yz} \neq d_{xz}$~~
- Dodecahedron ⇒ ~~$d_{xy} = d_{yz} \neq d_{xz}$ > $d_{z^2} = \neq d_{x^2-y^2}$~~
  - $d_{xy} = d_{yz} = d_{xz} = d_{x^2-y^2} > d_{z^2}$
  - $d_{xy} = d_{yz} = d_{xz} = d_{z^2} > d_{x^2-y^2}$.

Q. Why low spin & high spin complexes are formed ?

WFL SFL



Free CMI

* Priority order for comparison of stability of complexes for same CMI, same C.N. & diff. ligands :

⇒ C-donor > chelation

for same no. of ring(s)

Stability ∝ Δ. (CFSE).

Q. Stability order :

1) $PtCl_4^{2-}$ $PdCl_4^{2-}$ $NiCl_4^{2-}$ a > b > c {Z eff}

2) $K_4Fe(CN)_6$ $K_3Fe(CN)_6$ b > a {+ve charge on CMI}

3) $Ni(dmg)_2$ $[Ni(en)_2]^{2+}$ a > b {H-bonding}

4) $Cr(CN)_6^{3-}$, $Cr(C_2O_4)_3^{3-}$, $Cr(en)_3^{3+}$, $[Cr(NH_3)_6]^{3+}$, $[Cr(H_2O)_6]^{3+}$ a > c > b > d > e {c > chelate; if no chelate C > N > O > F}

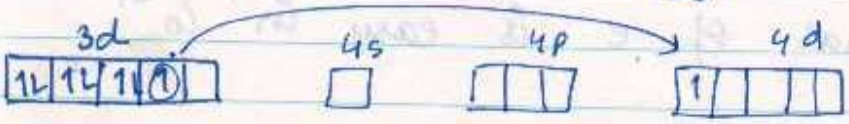
5) $[Fe(C_2O_4)_3]^{3-}$ $[Fe(acac)_3]$ b > a {no. of atoms in a ring}

* Transference of electrons :→

In presence of strong field ligand when single e⁻ is present in highest energy (n-1) d orbital, excitation of e⁻ takes place.

eg.

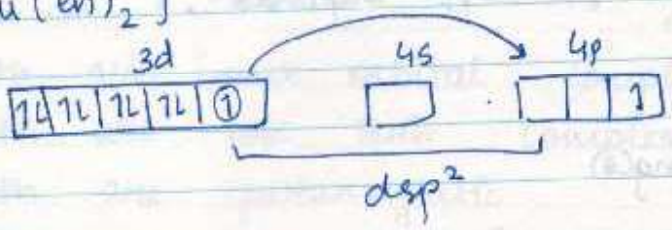
d^7 SFL in CN = 6. $[Co(CN)_6]^{4-}$



Get More Learning Materials Here : CLICK HERE www.studentbro.in

d^9 SFL in CN = 4

$[Cu(en)_2]^{+2}$



With the help of transference we can compare reducing nature of Co^{2+} in presence of different diff. ligands.

$[Co(H_2O)_6]^{2+} \longrightarrow [Co(H_2O)_6]^{+3}$ } E° = -ve

$NH_3 \longrightarrow$

$en \longrightarrow$

$CN^- \longrightarrow$ } E° = +ve

Strength of ligand ↑
rep^n b/w single e$^-$ & ligand ↑
Energy ↑

Reducing nature ↑

$\Delta G = -nfE$

↑ electrode potential

Reducing nature of

$[Cu(en)_2]^{2+}$ < $[Co(en)_3]^{2+}$

(A)

1) Zeff of $Cu^{2+} > Co^{2+}$
removal of e^- is easy in Co^{2+}

Get More Learning Materials Here : CLICK HERE www.studentbro.in

2) In complex A outermost e^- present in 4p while in complex B outermost e^- present in 4d
distance from nucleus
$4p < 4d$

* Jahn Teller distortion :→

When t_2g & eg subsets (set of orbitals) are unsymmetrically filled, octahedral complex is no more symmetrical. This is called Jahn teller distortion.

When t_2g set of orbitals are unsymmetrically filled distortion is very weak but when eg orbitals are unsymmetrically filled, strong distortion is observed.

	WFL	SFL

~~$[Cr(H_2O)_3Cl_3] \cdot 3H_2O$~~

Conductivity order : A > B > C

Moles of AgCl obt. when 1 mol of each reacts with excess $AgNO_3$: 3, 2, 1

Order of M. Wt. of product obt. on ran with conc. H_2SO_4 : A > B > C

Stability order : A > B > C

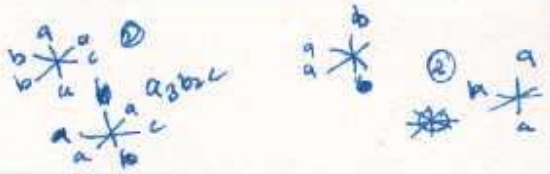
3] Linkage Isomerism :

Complexes having same MF also having ligands having same MF but co-ordinated by diff. diff. donor site with CMI are linkage isomers of each other. This type of isomerism arises when complex contains ambidentate ligand.

Eg,

$[Pt(NH_3)_3CN]Cl \longleftrightarrow [Pt(NH_3)_3NC]Cl$

Get More Learning Materials Here : CLICK HERE www.studentbro.in



Q. Find total no. of linkage isomers of $[Pt(CN)_4]^{2-}$.

→ 5

Q. $[Cr(CN)_3(NO_2)_3]^{3-}$ (4 × 4)

→ 16

Q. $[Pt(SCN)_2(NOS)_2]^{2-}$ (3 × 6)

→ 18

Q. Find total no. of isomers of $[Cr(NH_3)_3(CN)_3]$ (4)

2 × 3 = 6
2 × 2 = 4

→ 10

Q. Find the isomerism present b/w given pair of complexes

a) $[Cr(H_2O)_5NO_2]Cl_2$

b) $[Cr(H_2O)_4(NO_2)Cl]Cl \cdot H_2O$

c) $[Cr(H_2O)_5ONO]Cl_2$

d) $[Cr(H_2O)_4Cl_2]NO_2 \cdot H_2O$

→ ab → hydrate, ~~ionisation~~
ac → linkage
ad → hydrate, I
bc → linkage, ~~I~~, H
bd → I
cd → H, I

Note: I when counter "ions" get different

+7

4] Co-ordination Isomerism :

This type of isomerism arises when compound contains complex cation as well as complex anion.
Compounds having same MF but ligand or grp of ligands are present in diff. diff. co-ordination sphere, are co-ordination isomers of each other.

eg. $[Cr(NH_3)_6][Co(CN)_6] \longrightarrow [Cr(NH_3)_5CN][Co(CN)_5NH_3]$

⑥

$[Cr(NH_3)_4(CN)_2][Co(CN)_4(NH_3)_2]$

linkage ↳ CN (6 8)

$[Cr(NH_3)_2(CN)_4][Co(NH_3)_4(CN)_2]$

$[Cr(NH_3)(CN)_5][Co(NH_3)_5(CN)_6]$

+ ②

Q. Find total no. of C.N. isomers of this $[Co(NH_3)_6][Co(C_2O_4)_3]$

→ (1)

Q. $[Pt(NH_3)_4][Pt(Cl)_4(SCN)_2]$ C.N. isomers.

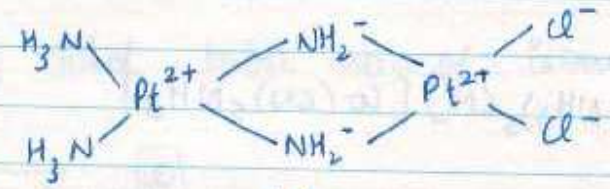
→ 1

Get More Learning Materials Here : CLICK HERE www.studentbro.in

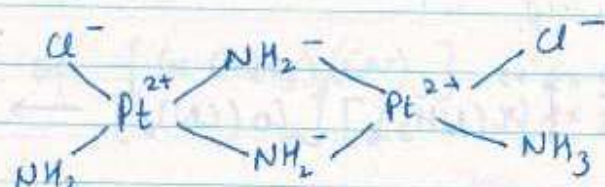
5] Co-ordination position :

This arises in binuclear complexes. Binuclear complexes having same MF but ligand or group of ligands are co-ordinated with diff. diff metal ion are co-ordination position isomers of each other.

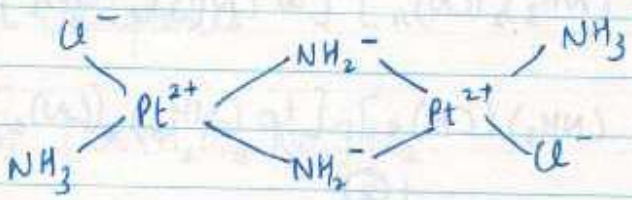
Eg,



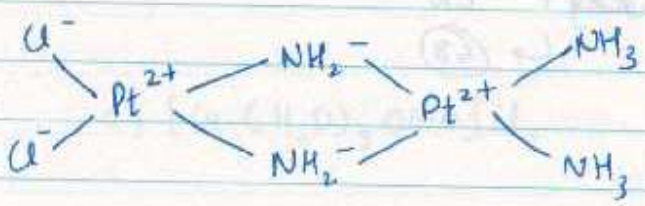
(A)



(B)



(C)



(D)

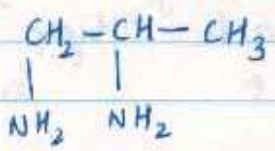
AB) CPI
AC) CPI
AD) Identical
BC) GI
BD) CPI
DC) CPI

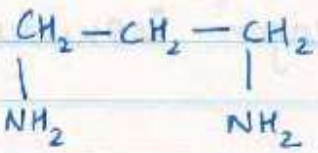
Get More Learning Materials Here : CLICK HERE www.studentbro.in

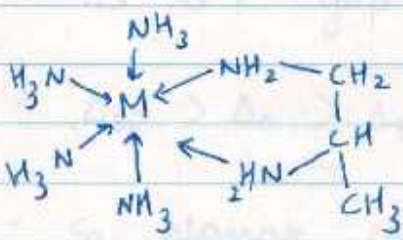
6] Ligand :

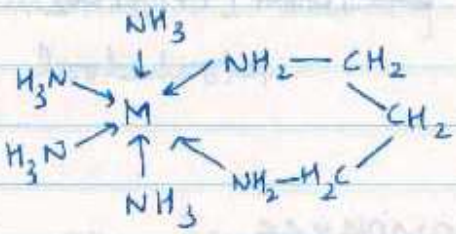
When complex contains ligand which can show position isomerism then complex can show ligand isomerism.

Eg,









Tetraammine - (1,2 - diamine propane) M.

7] Polymerisation :

This is not true isomerism. Complexes having diff. MF but same empirical formula are polymer isomers of each other.

	Pt	NH_3	Cl	
$[Pt(NH_3)_2Cl_2]$	1	2	2	PI
$[Pt(NH_3)_4][PtCl_4]$	2	4	4	
$[Pt(NH_3)_3Cl]_2[PtCl_4]$	3	6	6	

Get More Learning Materials Here : CLICK HERE www.studentbro.in

When a neutral complex contains, neutral ligand as well as anionic ligand it can show polymerisation isomerism.

* Allogen Isomerism :

Complexes having same MF but different geometry around CMI are allogen isomers of each other.

Eg,

$Ni(PPh_3)Cl_2$ ⇌ $Ni(PPh_3)Cl_2$

sq. planar — tetrahedral

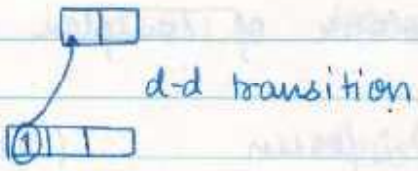
* COLOUR OF COMPLEXES :

Colour

- d-d transition
  - due to splitting
  - self excitation
  - No. of transition ↓
  - Intensity ↓
- Charge Transfer (CT)
  - Ligand to Metal (LMCT)
  - Metal to ligand (MLCT)
    - due to potential diff.
    - No. of transition ↑
    - Intensity ↑
  - Metal to Metal (MMCT)

Get More Learning Materials Here : CLICK HERE www.studentbro.in

* d-d transition



⇒ d^{10}, d^0, ~~d^5~~ - WFL (d^5 - WFL symmetrically filled)

⇒ d^{1-9} ⇒ $\Delta = \frac{hc}{\lambda_{ab}}$.

⇒ As Δ ↑ gap ↑ transition ↓ intensity ↓

⇒ $\Delta_{sp} > \Delta_o > \Delta_t$

• Sq. planar complexes are generally colourless or light yellow.
Tetrahedral complexes are more intense in comparison of octahedral

* $CoCl_4^{2-}$ → intense blue
$[Co(H_2O)_6]^{2+}$ → Pink

• Octahedral cyano complexes are yellow in colour.

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. Match them correctly

Complex	Colour of complex
A) $[Ni(H_2O)_6]^{2+}$	P) Green (R)
B) $[Ni(en)(H_2O)_4]^{2+}$	Q) Blue - Green
C) $[Ni(en)_2(H_2O)_2]^{2+}$	R) Blue (B)
D) $[Ni(en)_3]^{2+}$	S) Violet (Y)

→ A - P, B - Q, C - R, D - S VIBGYOR

$\lambda_{ab.} \Rightarrow$ R > Q > R > S

Q. Complex . colour

$\Delta \uparrow \lambda_{ab} \downarrow$

$[Cr(NH_3)_5Cl]^{2+}$ →	Yellow
$[Cr(NH_3)_5(H_2O)]^{3+}$ →	Green
$[Cr(NH_3)_6]^{3+}$ →	Blue
$[Cr(CN)_6]^{3-}$ →	Violet

→ For abs. colour,

A - S
B - R
C - Q
D - P

• Applications :→

- Coordination compounds find use in many qualitative and quantitative chemical analysis. The familiar colour rans given by metal ions with a number of ligands, as a result of formation of coordination entities, form the basis for their detection and estimation by classical & instrumental methods of analysis. Examples of such reagents include EDTA, DMG, α-nitroso-β-naphthol, cupron, etc.

- Hardness of water is estimated by simple titration with Na_2EDTA. The Ca^{2+} and Mg^{2+} ions form stable complexes with EDTA. The selective estimation of these ions can be done due to difference in the stability constants of calcium & magnesium complexes.

- Some important extraction processes of metals, like those of silver and gold, make use of complex formation. Gold, for example, combines with cyanide in the presence of oxygen and water to form the coordination entity $[Au(CN)_2]^-$ in aqeous sol^n. Gold can be separated in metallic form from this solution by the addition of zinc.

- Similarly, purification of metals can be achieved through formation and subsequent decomposition of their coordination compounds. For example, impure nickel is converted to $[Ni(CO)_4]$, which is decomposed to yield pure nickel.

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- Coordination compounds are of great importance in biological systems. The pigment responsible for photosynthesis, chlorophyll, is a coordination compound of magnesium. Haemoglobin, the red pigment of blood which acts as oxygen carrier is a coordination compound of iron. Vitamin B_{12}, cyanocobalamine, the anti-pernicious anaemia factor, is a coordination compound of cobalt. Among the other compounds of biological importance with coordinated metal ions are the enzymes like, carboxypeptidase A and carbonic anhydrase (catalysts of biological systems).

- Coordination compounds are used as catalysts for many industrial processes. Examples include rhodium complex, $[(Ph_3P)_3RhCl]$, a Wilkinson catalyst, is used for the hydrogenation of alkenes.

- Articles can be electroplated with silver and gold much more smoothly and evenly from solutions of the complexes, $[Ag(CN)_2]^-$ & $[Au(CN)_2]^-$ than from a solution of simple metal ions.

- In black and white photography, the developed film is fixed by washing with hypo solution which dissolves the undecomposed AgBr to form a complex ion, $[Ag(S_2O_3)_2]^{3-}$.

- There is growing interest in the use of chelate therapy in medicinal chemistry. An example is the treatment of problems caused by the presence of

Ex. 3 (A)

metals in toxic proportions in plant / animal systems. Thus, excess of copper and iron are removed by the chelating ligands D-penicillamine and desferrioxime B via the formation of coordination compounds. EDTA is used in the treatment of lead poisoning. Some coordination compounds of platinum effectively inhibit the growth of tumours. Examples are: cis platin and related compounds.

Types of Reaction

1] Acid - Base ran
- Neutralisation
- lewis acid - base
  - complex formation
  - Hydrolysis

(But not exactly lewis acid - base)

2] Thermal decomposition

3] Redox ran
- disp^{r}
- comp^{r}
- displacement
- decomp.
- combination

4] Ion exchange
- ppt formation
- ppt dissolution
- ppt exchange

* Neutralisation Ran :→

In this ran, formation of H_2O takes place & energy is released so ran moves in forward direction.

Acid : Compound of NM, generally they are molecules, exist in gaseous / liquid state. When dissolved in water, either ionisable (strong acid) or non-ionisable (weak acid).

Weak acid are present in water in soluble form

Get More Learning Materials Here : CLICK HERE www.studentbro.in

due to dipole-dipole interaction / H-bond with H_2O.
No ppt observed in water.

Base : Compound of metal, ionic in nature, exists in solid state, either soluble (strong base) or insoluble (weak base). Insoluble gives ppt in water

Salt : Ionic cmpd, solid state, either soluble or insoluble.

So, types of neutralisation rxn on the basis of observation :

1) $NaOH + HCl \longrightarrow NaCl + H_2O$ (Simple)
Clear Clear Clear

2) $Ba(OH)_2 + H_2SO_4 \longrightarrow BaSO_4\downarrow + H_2O$ (ppt formation)
Clear Clear White ppt

3) $Pb(OH)_2 + HNO_3 \longrightarrow Pb(NO_3)_2 + H_2O$ (ppt dissolution)
White ppt Clear Clear

4) $Ag_2O + HCl \longrightarrow AgCl\downarrow + H_2O$ (ppt exchange)
Black-Brown White

This rxn moves in → dir^{n} when either cation or anion or both disappear from sol^{n}.

- cation can disappear by,
  - i) ppt exchange rxn
    Eg, $AgCl + NaI \rightarrow AgI\downarrow + NaCl$
  - ii) by complex formation rxn
    Coz during complex f. Metal ion becomes CMI & loses its identity.

Eg, * All Ag salts are soluble in excess KCN
* All Ag salts are soluble in excess hypo except Ag_2S
* All Ag salts are soluble in excess NH_3 except AgI & Ag_2S

Solubility ↓ Covalent ↑

	AgCl	AgBr	AgI	Ag_2S	
H_2O	×	×	×	×	$[Ag(H_2O)_2]^+$
Cold NH_3	✓	×	×	×	$[Ag(NH_3)_2]^+$
Hot NH_3	✓	✓	×	×	$[Ag(NH_3)_2]^+$
$S_2O_3^{2-}$	✓	✓	✓	×	$[Ag(S_2O_3)_2]^{3-}$ ← CN = 4, chelation
CN^-	✓	✓	✓	✓	$[Ag(CN)_2]^-$

Stability : $[Ag(CN)_2]^- > [Ag(S_2O_3)_2]^{3-} > [Ag(NH_3)_2]^+ > [Ag(H_2O)_2]^+$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

As solubility of salt ↓
for dissolution, req. stability of complex ↑.

* All Pb(II) salts are soluble in excess NaOH except PbS due to formation of hydroxo complex

$$PbCO_3 + NaOH \longrightarrow \underset{\text{soluble}}{Na_2PbO_2} + Na_2CO_3$$

* All Zn(II) salts are soluble on excess NaOH except ZnS

$$ZnCO_3 + NaOH \longrightarrow \underset{\text{soluble}}{Na_2ZnO_2} + Na_2CO_3$$

• Anion can disappear by,
i] On reaction with strong acid

⇒ All carbonate salts are soluble in dil. HCl, dil. H_2SO_4, dil. HNO_3, CH_3COOH

$$\underset{\text{insoluble}}{Ag_2CO_3} + \text{dil. } HNO_3 \longrightarrow \underset{\text{soluble}}{AgNO_3} + CO_2\uparrow$$

⇒ To Dissolve — Acid which is not used for dissolution

Ag (I) salt	HCl, CH_3COOH
Pb (II) salt	dil. HCl, dil. H_2SO_4
Ba (II) salt	dil. H_2SO_4
Ca (II) salt	×

Get More Learning Materials Here : CLICK HERE www.studentbro.in

⇒ All insoluble CrO_4^{2-} are soluble in dil. HCl / dil. HNO_3 / dil. H_2SO_4

Acidic Nature $H_2CrO_4 <$ HCl / HNO_3 / H_2SO_4 / CH_3COOH
SA WA

$SrCrO_4$ is only CrO_4^{2-} which is soluble in CH_3COOH. H_2CrO_4 is non volatile while H_2CO_3 (CO_2) is volatile. Weak acid CH_3COOH mai saare CO_3^{2-} soluble hai coz CO_2 volatile hai, isliye $H_2O \longrightarrow$ le jayega.

WA CH_3COOH mai ek hi CrO_4^{2-} soluble hai $SrCrO_4$ coz saare insoluble CrO_4^{2-} mai uski solubility sabse jyada hai, H_2CrO_4 non volatile hai, soln mai pada rahega.

⇒ All insoluble oxlate are soluble in dil. HCl / dil. HNO_3/ dil. H_2SO_4

Only BaC_2O_4 is soluble in CH_3COOH among insoluble oxlate.

⇒ All insoluble sulphates are insoluble in dil. HCl, dil. H_2SO_4, dil. HNO_3, they are soluble in conc. acid

$$H_2SO_4 \xrightarrow{Ka_1} HSO_4^- \xrightarrow{Ka_2} SO_4^{2-}$$

$Ka_1 \gg Ka_2$

SO_4^{2-} is strong base in comparison of HSO_4^- so SO_4^{2-} can take H^+ only from conc. acid from soluble HSO_4^-

$BaSO_4$ + dil. $H_2SO_4 \longrightarrow$ ×

H_2O jyada hai isliye H^+ le lega

Get More Learning Materials Here : CLICK HERE www.studentbro.in

$BaSO_4$ + conc. $H_2SO_4 \longrightarrow Ba(HSO_4)_2$

H_2O km hai majburi mai H^+ SO_4^{2-} ko lena padega.

Zeff ↑

⇒ only black colour sulphide which insoluble in dil. HCl is FeS

⇒ Only sulphide which is insoluble in dil. HNO_3 is HgS

dil. $HCl + S^{2-} \longrightarrow H_2S$

No change in O.S. of 'S'

rxn can moves in backward dirⁿ

Get More Learning Materials Here : CLICK HERE www.studentbro.in

dil. $HNO_3 + S^{2-} \longrightarrow S\downarrow + NO\uparrow$

change in O.S. of 'S'

Rxn can't move in backward direc^n

So HNO_3 is better reagent for dissolution of black colour sulphide in comparison of dil. HCl.

- By Redox change :

$AgNO_2\downarrow + O_3 \longrightarrow AgNO_3 + O_2\uparrow$

(White) Soluble

* COMPLEX FORMATION REACTION :-

- It is lewis acid - base rxn.
- This rxn is based on hard soft acid base theory Acc^n to this theory (HSAB), strong lewis acid prefers to form complex with strong lewis base & weak lewis acid prefers to form complex with weak lewis base.

Eg, d-block metal ions form cyano complex, p-bloc & mercury do not form complex with cyanid ion.

- d-block cations except Fe, Mn, Hg form complex with NH_3.
- p-block cation & Hg form iodo complex.
- d-block as well as p-block cations form complex with hypo ($S_2O_3^{2-}$), weak field ligand but forms stable complex due to chelation

• Reagents of Precipitation :

1] NaOH :→

$M^{+x}_{(aq.)} \xrightarrow{NaOH} M(OH)_x$

$M \neq NH_4, IA, Ba-Sr, Ca$

$M(OH)_x \rightarrow$ Basic $\xrightarrow{NaOH}$ X

$M(OH)_x \rightarrow$ Amphoteric $\xrightarrow{NaOH}$ soluble sod. salt

Zn, Be, Al, Ga, Sn, Cr^{+3}, V^{+5}, Sb^{+3}, As^{+3}, Pb

S, p block d^{10} → White

Cr^{3+}, Fe^{2+}, Ni^{2+} → Green

Cu^{2+}, Cr^{2+} → Blue

Mn^{2+}, Co^{2+} → Pink

$Fe(OH)_3$ → Reddish Brown.

- $Al^{+3} \xrightarrow{NaOH} Al(OH)_3 \downarrow \xrightarrow{NaOH} NaAlO_2$

  $Al^{+3} \xrightarrow{\text{excess NaOH}} NaAlO_2$

- $Fe^{3+} \xrightarrow{NaOH} Fe(OH)_3 \downarrow \xrightarrow{NaOH} X$

  $Fe^{3+} \xrightarrow{\text{excess NaOH}} Fe(OH)_3 \downarrow$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

2] NH_3 / NH_4OH :→

- NH_3 is a WB, when it dissolves in water initially it gives OH^- so reacts like NaOH but as it is a weak base, it gives a limited amount of OH^- in water.

On adding excess NH_3 / NH_4OH, NH_3 present in water in molecular form, forms H-bond with H_2O.

So in excess NH_3, main reagent is NH_3 & in limited NH_3 main reagent is OH^-.

In excess NH_3, NH_3 acts as ligand, shows complex formation rxn, it is a SFL so forms complex with d block cation.

$M^{+x} \xrightarrow{NH_4OH/NH_3} M(OH)_x \downarrow$

$M \neq NH_4^+, IA, Ba, Sr, Ca$

d block $\xrightarrow{NH_3}$ soluble complex (except Fe, Mn, Hg)

p block $\xrightarrow{NH_3}$ X

→ Hg shows complex formation as like p block cation due to large size, absence of (n-1)d orbitals

⇒ NH_3 acts as WFL for Mn^{2+}, Fe^{+2}

⇒ K_{sp} of $Fe(OH)_3$ is very very low so it is perfect ppt in presence of NH_3.

d^{10} → colourless

$Cu^{2+}_{(amm.)}$, $Ni^{2+}_{(amm.)}$ → Blue

Ba^{2+} × × × ×

Ca^{2+} × × × ×

3] KI :

→ Solubility :- All iodide are water soluble except Ag^+, Bi^{3+}, Cu^+, Hg_2^{2+} / Hg^{2+}, Pb^{2+}

→ Cu^{2+} & Fe^{3+} show redox rxn with I^-

→ In excess of KI :- $I^- \rightarrow$ WFL

p block, Hg insoluble iodide are soluble in excess KI due to formation of iodo complex.

Only iodo complex which is coloured = BiI_4^- (yellow - orange) due to polarization

- $Cu^{2+} + KI \longrightarrow \underset{\text{white}}{CuI\downarrow} + \underset{\text{Brown}}{I_2 / KI_3}$

  $\xrightarrow[KI]{} X$

- $Ag^+ + KI \longrightarrow \underset{\text{Yellow}}{AgI\downarrow} \xrightarrow{KI} X$

- $Pb^{2+} \xrightarrow{KI} \underset{\text{yellow}}{PbI_2\downarrow} \xrightarrow{KI} \underset{\text{Clear}}{PbI_4^{2-}}$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- $Hg^{2+} \xrightarrow{KI} HgI_2\downarrow$ (red) $\xrightarrow{KI} HgI_4^{2-}$ (clear)
  $\downarrow \Delta$
  HgI_2 (yellow)

- $Hg_2^{2+} \xrightarrow{KI} Hg_2I_2$ (green) $\longrightarrow Hg\downarrow$ (Black) $+ HgI_4^{2-}$ (clear)

  - Hg_2^{2+} disp^{n} in presence of ligand Hg (Black ppt) $+ Hg^{2+}$

- $Bi^{3+} \xrightarrow{KI} BiI_3\downarrow$ (Black-brown) $\xrightarrow{KI} BiI_4^-$ (yellow-orange)

- $Fe^{3+} + KI \longrightarrow Fe^{2+} + I_2 / KI_3$

- $K_4Fe(CN)_6 + KI \longrightarrow \times$

- $K_3Fe(CN)_6 + KI \longrightarrow K_4Fe(CN)_6 + KI_3 / I_2$

* Note :

- $Ag^+ \xrightarrow[NH_3]{\text{excess}} [Ag(NH_3)_2]^+ \xrightarrow[\text{Standing}]{\text{on}} Ag_3N$
  $\downarrow$ explosive rxn
  $Ag + N_2$ (ΔG = -ve)

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- $Hg^{2+} X^-$ $\xrightarrow[NH_3]{\text{excess}}$ $HgO \cdot HgNH_2^+ X^-$

due to high p.p. of Ag^+ & Hg^{2+}

4] KCN :→

- All cyanides are water insoluble except NH_4^+, IA, IIA, $Hg(CN)_2$

- CN^- polyatomic anion, p block, polarizability ↓

- S, p block, d^{10} → white

d^{1-9} (gen.) → yellow

- excess KCN : All insoluble d-block cyanide are soluble in excess KCN

CN^- → Strongest ligand (Complex of cyano)
d^{10} → clear solution
d^{1-9} (gen.) → Yellow
(Octahedral)

- Cu^{2+} shows redox with CN^-

Eg,

- $Ag^+ \xrightarrow{KCN} \underset{\text{white}}{AgCN\downarrow} \xrightarrow{KCN} \underset{\text{clear}}{[Ag(CN)_2]^-}$
- $Pb^{2+} \xrightarrow{KCN} \underset{\text{white}}{Pb(CN)_2\downarrow} \xrightarrow{KCN} X$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- $Cu^{2+} \xrightarrow{KCN} Cu(CN)_2 \downarrow$ (yellow-brown) $\xrightarrow{\text{On standing}} CuCN \downarrow$ (white) $+ (CN)_2 \uparrow$
  $\xrightarrow{KCN} K_3[Cu(CN)_4]$
- $Cd^{2+} / Zn^{2+} \xrightarrow{KCN}$ White ppt $\downarrow \xrightarrow{KCN}$ Clear sol^n
- $Fe^{3+} \xrightarrow{KCN} Fe(CN)_3 \downarrow$ (Yellow-brown) $\xrightarrow{KCN} K_3[Fe(CN)_6]$ } Yellow colour
- $Fe^{2+} \xrightarrow{KCN} Fe(CN)_2 \downarrow$ (Yellow) $\xrightarrow{KCN} K_4[Fe(CN)_6]$
- $Ni^{2+} \xrightarrow{KCN} Ni(CN)_2 \downarrow$ (greenish-yellow) $\xrightarrow{KCN} K_2[Ni(CN)_4]$ (Clear)
- $Hg_2^{2+} \xrightarrow{KCN} Hg_2(CN)_2 \downarrow \xrightarrow{KCN} Hg$ (Black ppt) $+ Hg(CN)_2$ (Clear)

Q. $M^{+x} \xrightarrow{NaOH}$ Reddish Brown ppt $\xrightarrow{NH_4OH} X$

$M^{+x} \xrightarrow{KCN} A \xrightarrow{KCN} C \rightarrow [M^{+4}]$ + F

$M^{+x} \xrightarrow{KI} M^{+y} \xrightarrow{KCN} B \xrightarrow{KCN} D \rightarrow [M^{+4}]$ + G, H

Identify A - H & M^{+x}.

→ $M^{+x} = Fe^{3+}$

A = $Fe(CN)_3$
B = $Fe(CN)_2$
C = $K_3[Fe(CN)_6]$
D = $K_4[Fe(CN)_6]$
E = $Fe[Fe(CN)_6]$
F = $Fe_3[Fe(CN)_6]_2$
G = $Fe_4[Fe(CN)_6]_3$
H = $Fe_2[Fe(CN)_6]$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. Which pair of ions can be separated by NaOH?

A) Pb^{2+} ; Cu^{2+}
B) Al^{3+}, Ca^{2+}
C) Ni^{2+}, Zn^{2+}
D) Cr^{3+}, Fe^{3+}

Q. Which d-block metal ion is soluble in excess NH_3 as well as excess NaOH but when limited NaOH is used it gives white coloured ppt?

→ Zn^{2+}

Q. A metal ion gives ppt & coloured sol^n when reacts with KI. Find the formula of cmpd when metal ion reacts with excess KCN.

→ $K_3[Cu(CN)_6]$

5] Na_2CO_3 :-

- All CO_3^{2-} water insoluble except NH_4^+, IA
- Colour : s/p block, Zn^{2+} → white
  d block → coloured (except Zn^{2+})
- ppt :
  $M^+ \longrightarrow M_2CO_3$
  $M^{2+} \longrightarrow MCO_3 \cdot M(OH)_2$
  except Ca^{2+}, Ba^{2+}, Sr^{2+}, Fe^{2+} → value of K_{sp} is high
  ↳ soluble OH^-
  P.P.↓ $M^{+3} \longrightarrow M(OH)_3$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

$M^{+n} \leftarrow O \begin{cases} H \\ H \end{cases}$ $\quad H_2O \rightarrow H^+ \; OH^- \quad [OH^-] \uparrow$

$H^+ + CO_3^{2-} \rightarrow HCO_3^- \quad [CO_3^{2-}] \downarrow$

- All CO_3^{2-} are soluble in dil. HCl / dil. H_2SO_4 / dil. HNO_3 as well as in CH_3COOH due to formation of volatile CO_2.

6] Na_2CrO_4 :→

- All CrO_4^{2-} are water soluble except $\underbrace{Ag^+, Hg_2^{2+}}_{\text{Red}}, \underbrace{Sr^{2+}, Ba^{2+}, Pb^{2+}}_{\text{Yellow}}$

- $Hg_2^{2+} \xrightarrow{CrO_4^{2-}}$ Brown ppt (Unknown comp.) $\xrightarrow{\Delta}$ Hg_2CrO_4 (Red)

- CrO_4^{2-} is anion of WA H_2CrO_4 which is non volatile. All insoluble CrO_4^{2-} are soluble in SA (dil. HCl, HNO_3, H_2SO_4) but only one insoluble CrO_4^{2-} is soluble in CH_3COOH which is $SrCrO_4$ due to its high Ksp among insoluble CrO_4^{2-}.

7] $Na_2C_2O_4$:→

- All $C_2O_4^{2-}$ are water insoluble except NH_4^+, IA, FeC_2O_4, BeC_2O_4

Colour : white except $Fe_2(C_2O_4)_3$ (Blue) ⇒ used in blueprints

- $H_2C_2O_4$ is a WA, non volatile in nature, $C_2O_4^{2-}$ is SB so soluble in SA but only one insoluble $C_2O_4^{2-}$ is soluble in CH_3COOH which is BaC_2O_4 due to its high Ksp among insoluble oxlate

Ksp $\quad \underbrace{Mg < Ca < Sr < Ba}_{\text{insoluble}} < \underbrace{Be}_{\text{Soluble}}$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

8] Na_2SO_4 :→

- All sulphates are water soluble except Hg^{2+}, Sr^{2+}, Ba^{2+}, Pb^{2+}

Colour : Anhydrous sulphate = white

- SO_4^{2-} is anion of SA so insoluble SO_4^{2-} are not soluble in any dil. acid

$BaSO_4$ + dil. H_2SO_4 → ×

Insoluble SO_4^{2-} are soluble in conc. HCl / HNO_3 / H_2SO_4 due to formation of HSO_4^-

$BaSO_4$ + conc. H_2SO_4 ⟶ $Ba(HSO_4)_2$

9] $Na_2S_2O_3$:→
(aq. sol^n of Hypo.)

Solubility : All thio sulphates are water soluble except Ag^+, Bi^{3+}, Cu^+, $[Ni(en)_3]^{2+}$, Hg_2^{2+} / Hg^{2+}, Ba^{2+}, Pb^{2+}

Colour : Simple thiosulphate salts ⟶ white

$[Ni(en)_3]S_2O_3$ ⟶ Purple

coloured due to d-d transition (complex cation)

Excess $Na_2S_2O_3$:

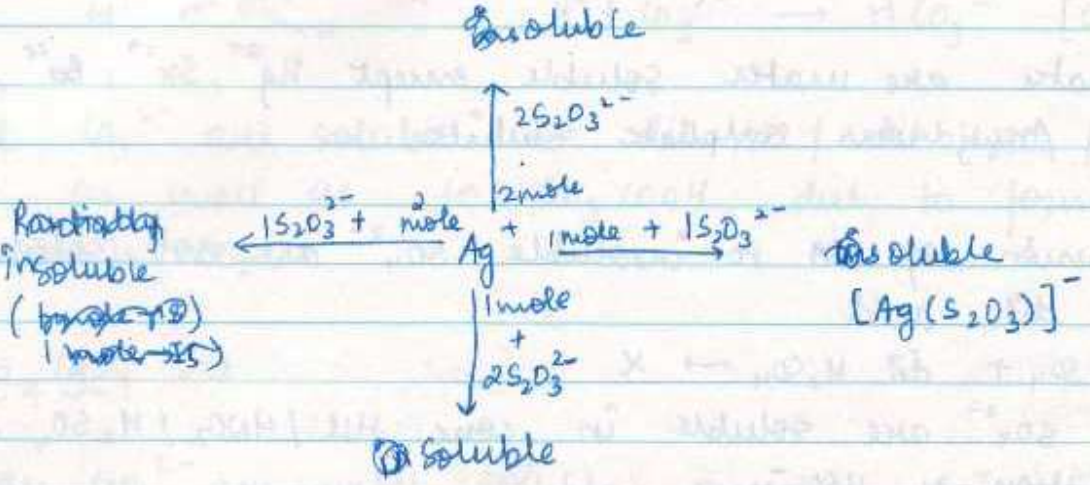
$S_2O_3^{2-}$ → WFL (f block cations are soluble)

→ SFL (d block cations are soluble)
chelation

- All insoluble simple thiosulphates are soluble in excess thiosulphate except BaS_2O_3.

Get More Learning Materials Here : CLICK HERE www.studentbro.in

Q. soluble / insoluble



10] H_2S :→

(Na_2S, $H_2S + H^+$)

$H_2S \rightleftharpoons H^+ \; S^{2-}$

WA

$\xleftarrow{H^+}$ $[S^{2-}]\downarrow$

$\xrightarrow{OH^-}$ $[S^{2-}]\uparrow$

Conc. of S^{2-}

Na_2S or $H_2S + OH^- > H_2S > H_2S + H^+$

• ppt in diff. conc. of S^{2-}

in Na_2S → all are insoluble except NH_4^+, IA, IIA

Get More Learning Materials Here : CLICK HERE www.studentbro.in

in H_2S + HCl → Ag^+, Hg^{2+}, Pb^{2+}, Pb^{2+}, Cu^{2+}, Bi^{3+}, Hg^{2+}, Cd^{2+}, $Sb^{3+/5+}$, $Sn^{2+/4+}$, $As^{3+/5+}$ } ← Ksp ↓ (x)

in H_2S → x + Zn^{2+}

- Colour of insoluble sulphide

Black : PbS, HgS, Ag_2S, FeS, CuS, CoS, NiS
White : ZnS
Pink / buff : MnS
Yellow : Cd^{2+}, $As^{3+/5+}$, Sn^{4+}
Orange : $Sb^{3+/5+}$
Black-Brown : Sn^{2+}, Bi^{3+}

- MgS, Al_2S_3, Cr_2S_3 exist only in solid state in aq. medium they get hydrolysed

$$Al_2S_{3(s)} \xrightarrow{H_2O} Al(OH)_3 \downarrow + H_2S \uparrow$$

- Fe^{3+} shows redox with S^{2-}

- Dissolution of insoluble sulphides :

Hot & dil. HNO_3 > HCl > CH_3COOH
SA + OA SA WA

- HgS is only sulphide which is insoluble in hot & dil. HNO_3.
- due to its lowest K_{sp} among sulphides.

Get More Learning Materials Here : CLICK HERE www.studentbro.in

- MnS is only sulphide which is soluble in CH_3COOH due to very high K_{sp}.

- Among black coloured sulphides, FeS is only sulphide which is soluble in dil. HCl due to high ionic ch^r (low P.P. of Fe^{2+}).

- Those who precipitate in presence of HCl are insoluble in dil. HCl.

- Only ZnS, MnS & FeS are soluble in dil. HCl.

i] $CaCl_2$

Ca^{2+} — Cl^-

All Cl^- are water soluble except Ag^+, Cu^+, Hg_2^{2+}, Pb^{2+}

Ca^{2+} → Insoluble (CaF_2, $CaCO_3$, $CaSO_3$, $Ca_3(PO_4)_2$, CaC_2O_4)

All are soluble in dil. HCl.

ii] $BaCl_2$

Ba^{2+}

Insoluble : $BaCO_3$, BaC_2O_4 (soluble in CH_3COOH), $BaSO_3$, $Ba_3(PO_4)_2$, BaS_2O_3, $BaSO_4$, $BaCrO_4$ → coloured

$BaSO_4$ → Insoluble in dil. HCl

Get More Learning Materials Here : CLICK HERE www.studentbro.in

13] $AgNO_3$
↳ Ag^+

Soluble : AgF, Ag_2SO_4, $AgNO_3$, all bi salts

Solubility : - All Ag (I) salts are soluble in hot & dil. HNO_3 except AgCl, AgBr, AgI
Acidic nature $HCl / HBr / HI > HNO_3$

- All Ag(I) salts are soluble in NH_4OH except AgI & Ag_2S

- All Ag (I) salts are soluble in hypo except Ag_2S

- All Ag (I) salts are soluble in KCN.

14] $(CH_3COO)_2Pb$
↳ Pb^{2+}

Soluble : $(CH_3COO)_2Pb$, $Pb(NO_2)_2$, $Pb(NO_3)_2$, all bi salts

Solubility : - All Pb (II) salts are soluble in NaOH except PbS
- All Pb (II) salts are soluble in hot & dil. HNO_3 except $PbSO_4$, $PbCl_2$, $PbBr_2$, PbI_2
- Only white ppt which is soluble in hot water is b $PbCl_2$

Get More Learning Materials Here : CLICK HERE www.studentbro.in

3) $Li + air \longrightarrow Li_2O + Li_3N$

$Na + air \longrightarrow Na_2O_2$

$K + air \longrightarrow KO_2$

$Mg + air \xrightarrow{RT} X$

$Mg + air \xrightarrow{\Delta} MgO$

- Comproportionation Rxn :-

1] Non metal $+ H_2O/OH^- \xrightarrow[H^+]{disp^r}$ Acid / salt (two type)

$Na_2S + Na_2S_2O_3 \xrightarrow{H^+} S\downarrow$

$NaCl + NaOCl \xrightarrow{H^+} Cl_2\uparrow$

$NaI + NaIO_3 \xrightarrow{H^+} I_2$

$PH_3 + H_3PO_4 \xrightarrow{H^+} X$

~~OX~~

*// $H_2S + SO_2 \longrightarrow S\downarrow + H_2O$

$HCl + HOCl \xrightarrow{H^+} Cl_2 + H_2O$

$HI + HOI \longrightarrow I_2 + H_2O$

2) $Mn^{2+} + KMnO_4 \xrightarrow{H^+/ZnSO_4}$ ~~K_2MnO_4~~ MnO_2

3) $S + Conc.\ H_2SO_4 \longrightarrow$ ~~H_2S~~ $+ SO_2$

$S + dil.\ H_2SO_4 \longrightarrow X$

4) $NaH + H_2O \longrightarrow H_2\uparrow + NaOH$

5) $Cu^+_{(aq.)} \longrightarrow Cu^{2+}_{(aq.)} + Cu$

$\longleftarrow$ when insoluble cmpd of Cu^+ forms

NH_2CONH_2

6) $N^{-3} + N^{+3} \longrightarrow N_2$

$NH_4Cl + HNO_2 \longrightarrow N_2\uparrow + 2H_2O + HCl$

$RNH_2 + HNO_2 \longrightarrow N_2\uparrow + H_2O + ROH$

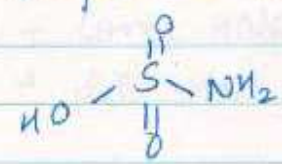
$Urea + HNO_2 \longrightarrow N_2\uparrow + H_2O + CO_2$

$Thiourea + HNO_2 \longrightarrow N_2\uparrow + H_2O + HNCS$

$\downarrow Fe(OH)_3$

Blood red

Sulphamic acid



$+ HNO_2 \rightarrow N_2\uparrow + H_2O + SO_3 \ (H_2SO_4).$

7) Heating of Ammonium salts :
(containing anion 'N' atom)

$\overset{-3}{N}H_4\overset{+3}{N}O_2 \xrightarrow{\Delta} N_2 + 2H_2O$

$\overset{-3}{N}H_4\overset{+5}{N}O_3 \xrightarrow{\Delta} N_2O + H_2O$

$\overset{-3}{N}H_4\overset{-1}{N}_3 \xrightarrow{\Delta} N_2H_2$

$KMnO_4 / H^+$ → $S_2O_3^{2-}$ → $S + SO_4^{2-}$

$KMnO_4 / H^+$ → $S_2O_3^{2-}$ (limited) → HSO_4^- / SO_4^{2-}

- $KMnO_4 + I^- \xrightarrow{OH^-} IO_3^- + MnO_2$
- $KMnO_4 + S_2O_3^{2-} \xrightarrow{OH^-} MnO_2 + SO_4^{2-}$
- $K_2Cr_2O_7 / H^+$

HCl	Cl_2
HBr	Br_2
HI	I_2
H_2S	S
HNO_2	HNO_3
H_3AsO_3	AsO_4
SO_2	SO_4^{2-}
NO_2	HNO_3
CO_2	X
Sn^{2+}	Sn^{4+}
Fe^{2+}	Fe^{3+}

Cr^{3+}

- $Cr^{3+} + H_2O_2 + OH^- \longrightarrow CrO_4^{2-}$

$Cr_2O_7^{2-} / H^+ + H_2O_2 \longrightarrow$ Blue CrO_5 $\longrightarrow Cr_2O_3 + O_2\uparrow$

Stable in organic solvent having N/O donor atom
