19. 16 rows, 5 logs are placed in the top row. By putting S = 200, a = 20, d = -1 in the formula S = n/2 [2a + (n - 1)d], we get, 41n - n<sup>2</sup> = 400. On solving, n = 16, 25. Therefore, the number of rows is either 16 or 25. a<sub>25</sub> = a + 24 d = -4

i.e., number of logs in 25th row is - 4 which is not possible. Therefore n = 25 is not possible. For n = 16, a<sub>16</sub> = 5. Therefore, there are 16 rows and 5 logs placed in the top row.

$$\frac{25}{36}$$
 (ii)  $\frac{11}{36}$ 

- 25. (i) Incorrect. We can classify the outcomes like this but they are not then 'equally likely'. Reason is that 'one of each' can result in two ways from a head on first coin and tail on the second coin or from a tail on the first coin and head on the second coin. This makes it twicely as likely as two heads (or two tails).
  - (ii) Correct. The two outcomes considered in the question are equally likely.
