

# **RELATIONS AND FUNCTIONS**

# **1.1 Overview**

# 1.1.1 Relation

A relation R from a non-empty set A to a non empty set B is a subset of the Cartesian product  $A \times B$ . The set of all first elements of the ordered pairs in a relation R from a set A to a set B is called the domain of the relation R. The set of all second elements in a relation R from a set A to a set B is called the range of the relation R. The whole set B is called the codomain of the relation R. Note that range is always a subset of codomain.

# **1.1.2** Types of Relations

A relation R in a set A is subset of  $A \times A$ . Thus empty set  $\phi$  and  $A \times A$  are two extreme relations.

- (i) A relation R in a set A is called empty relation, if no element of A is related to any element of A, i.e.,  $R = \phi \subset A \times A$ .
- (ii) A relation R in a set A is called universal relation, if each element of A is related to every element of A, i.e.,  $R = A \times A$ .
- (iii) A relation R in A is said to be reflexive if aRa for all  $a \in A$ , R is symmetric if  $aRb \Rightarrow bRa$ ,  $\forall a, b \in A$  and it is said to be transitive if aRb and  $bRc \Rightarrow aRc$  $\forall a, b, c \in A$ . Any relation which is reflexive, symmetric and transitive is called an equivalence relation.
- Note: An important property of an equivalence relation is that it divides the set into pairwise disjoint subsets called equivalent classes whose collection is called a partition of the set. Note that the union of all equivalence classes gives the whole set.

# **1.1.3** Types of Functions

(i) A function  $f: X \to Y$  is defined to be one-one (or injective), if the images of distinct elements of X under *f* are distinct, i.e.,

 $x_1, x_2 \in \mathbf{X}, f(x_1) = f(x_2) \Rightarrow x_1 = x_2.$ 

(ii) A function f: X → Y is said to be onto (or surjective), if every element of Y is the image of some element of X under f, i.e., for every y ∈ Y there exists an element x ∈ X such that f (x) = y.

**CLICK HERE** 

(iii) A function  $f: X \to Y$  is said to be one-one and onto (or bijective), if f is both oneone and onto.

### **1.1.4** Composition of Functions

(i) Let  $f : A \to B$  and  $g : B \to C$  be two functions. Then, the composition of f and g, denoted by  $g \circ f$ , is defined as the function  $g \circ f : A \to C$  given by

$$g \ o \ f(x) = g \ (f(x)), \ \forall \ x \in \mathbf{A}.$$

- (ii) If  $f: A \to B$  and  $g: B \to C$  are one-one, then  $g \circ f: A \to C$  is also one-one
- (iii) If *f* : A → B and *g* : B → C are onto, then *g* o *f* : A → C is also onto.
  However, converse of above stated results (ii) and (iii) need not be true. Moreover, we have the following results in this direction.
- (iv) Let  $f: A \to B$  and  $g: B \to C$  be the given functions such that  $g \circ f$  is one-one. Then f is one-one.
- (v) Let  $f: A \to B$  and  $g: B \to C$  be the given functions such that  $g \circ f$  is onto. Then g is onto.

### **1.1.5** Invertible Function

- (i) A function f : X → Y is defined to be invertible, if there exists a function g : Y → X such that g of = I<sub>x</sub> and f o g = I<sub>y</sub>. The function g is called the inverse of f and is denoted by f<sup>-1</sup>.
- (ii) A function  $f: X \to Y$  is invertible if and only if f is a bijective function.
- (iii) If  $f : X \to Y$ ,  $g : Y \to Z$  and  $h : Z \to S$  are functions, then  $h \circ (g \circ f) = (h \circ g) \circ f$ .
- (iv) Let  $f: X \to Y$  and  $g: Y \to Z$  be two invertible functions. Then  $g \circ f$  is also invertible with  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ .

### **1.1.6** Binary Operations

- (i) A binary operation \* on a set A is a function  $*: A \times A \rightarrow A$ . We denote \*(a, b) by a \* b.
- (ii) A binary operation \* on the set X is called commutative, if a \* b = b \* a for every  $a, b \in X$ .
- (iii) A binary operation  $* : A \times A \rightarrow A$  is said to be associative if (a \* b) \* c = a \* (b \* c), for every  $a, b, c \in A$ .
- (iv) Given a binary operation  $*: A \times A \rightarrow A$ , an element  $e \in A$ , if it exists, is called identity for the operation \*, if a \* e = a = e \* a,  $\forall a \in A$ .

**CLICK HERE** 

>>>

(v) Given a binary operation  $* : A \times A \rightarrow A$ , with the identity element e in A, an element  $a \in A$ , is said to be invertible with respect to the operation \*, if there exists an element b in A such that a \* b = e = b \* a and b is called the inverse of a and is denoted by  $a^{-1}$ .

### **1.2 Solved Examples**

Short Answer (S.A.)

**Example 1** Let  $A = \{0, 1, 2, 3\}$  and define a relation R on A as follows:

 $\mathbf{R} = \{(0, 0), (0, 1), (0, 3), (1, 0), (1, 1), (2, 2), (3, 0), (3, 3)\}.$ 

Is R reflexive? symmetric? transitive?

Solution R is reflexive and symmetric, but not transitive since for  $(1, 0) \in \mathbb{R}$  and  $(0, 3) \in \mathbb{R}$  whereas  $(1, 3) \notin \mathbb{R}$ .

**Example 2** For the set  $A = \{1, 2, 3\}$ , define a relation R in the set A as follows:

 $\mathbf{R} = \{(1, 1), (2, 2), (3, 3), (1, 3)\}.$ 

Write the ordered pairs to be added to R to make it the smallest equivalence relation.

**Solution** (3, 1) is the single ordered pair which needs to be added to R to make it the smallest equivalence relation.

**Example 3** Let R be the equivalence relation in the set Z of integers given by  $R = \{(a, b) : 2 \text{ divides } a - b\}$ . Write the equivalence class [0].

**Solution**  $[0] = \{0, \pm 2, \pm 4, \pm 6, ...\}$ 

**Example 4** Let the function  $f : \mathbf{R} \to \mathbf{R}$  be defined by f(x) = 4x - 1,  $\forall x \in \mathbf{R}$ . Then, show that *f* is one-one.

**Solution** For any two elements  $x_1, x_2 \in \mathbf{R}$  such that  $f(x_1) = f(x_2)$ , we have

$$4x_1 - 1 = 4x_2 - 1$$

$$\Rightarrow 4x_1 = 4x_2$$
, i.e.,  $x_1 = x_2$ 

Hence *f* is one-one.

**Example 5** If  $f = \{(5, 2), (6, 3)\}, g = \{(2, 5), (3, 6)\}$ , write  $f \circ g$ .

**Solution**  $f \circ g = \{(2, 2), (3, 3)\}$ 

**Example 6** Let  $f : \mathbf{R} \to \mathbf{R}$  be the function defined by  $f(x) = 4x - 3 \forall x \in \mathbf{R}$ . Then write  $f^{-1}$ .

>>

 $f^{-1}$ 

Solution Given that f(x) = 4x - 3 = y (say), then 4x = y + 3 $\Rightarrow \qquad x = \frac{y+3}{4}$ 

Hence

$$(y) = \frac{y+3}{4} \implies f^{-1}(x) = \frac{y+3}{4}$$

**Example 7** Is the binary operation \* defined on Z (set of integer) by m \* n = m - n + mn  $\forall m, n \in \mathbb{Z}$  commutative?

Solution No. Since for  $1, 2 \in \mathbb{Z}$ , 1 \* 2 = 1 - 2 + 1.2 = 1 while 2 \* 1 = 2 - 1 + 2.1 = 3 so that  $1 * 2 \neq 2 * 1$ .

**Example 8** If  $f = \{(5, 2), (6, 3)\}$  and  $g = \{(2, 5), (3, 6)\}$ , write the range of f and g.

**Solution** The range of  $f = \{2, 3\}$  and the range of  $g = \{5, 6\}$ .

**Example 9** If  $A = \{1, 2, 3\}$  and *f*, *g* are relations corresponding to the subset of  $A \times A$  indicated against them, which of *f*, *g* is a function? Why?

 $f = \{(1, 3), (2, 3), (3, 2)\}$  $g = \{(1, 2), (1, 3), (3, 1)\}$ 

**Solution** f is a function since each element of A in the first place in the ordered pairs is related to only one element of A in the second place while g is not a function because 1 is related to more than one element of A, namely, 2 and 3.

**Example 10** If  $A = \{a, b, c, d\}$  and  $f = \{a, b), (b, d), (c, a), (d, c)\}$ , show that *f* is one-one from A onto A. Find  $f^{-1}$ .

**Solution** *f* is one-one since each element of A is assigned to distinct element of the set A. Also, *f* is onto since f(A) = A. Moreover,  $f^{-1} = \{(b, a), (d, b), (a, c), (c, d)\}$ .

**Example 11** In the set N of natural numbers, define the binary operation \* by m \* n = g.c.d (m, n), m,  $n \in \mathbb{N}$ . Is the operation \* commutative and associative?

Solution The operation is clearly commutative since

 $m * n = g.c.d(m, n) = g.c.d(n, m) = n * m \forall m, n \in \mathbb{N}.$ 

It is also associative because for  $l, m, n \in \mathbb{N}$ , we have

$$l * (m * n) = g. c. d (l, g.c.d (m, n))$$
  
= g.c.d. (g. c. d (l, m), n)  
= (l \* m) \* n.

**CLICK HERE** 

>>

## Long Answer (L.A.)

**Example 12** In the set of natural numbers **N**, define a relation R as follows:  $\forall n, m \in \mathbf{N}, nRm$  if on division by 5 each of the integers *n* and *m* leaves the remainder less than 5, i.e. one of the numbers 0, 1, 2, 3 and 4. Show that R is equivalence relation. Also, obtain the pairwise disjoint subsets determined by R.

**Solution** R is reflexive since for each  $a \in \mathbf{N}$ , aRa. R is symmetric since if aRb, then bRa for  $a, b \in \mathbf{N}$ . Also, R is transitive since for  $a, b, c \in \mathbf{N}$ , if aRb and bRc, then aRc. Hence R is an equivalence relation in **N** which will partition the set **N** into the pairwise disjoint subsets. The equivalent classes are as mentioned below:

$$\begin{split} \mathbf{A}_{0} &= \{5,\,10,\,15,\,20\,\ldots\} \\ \mathbf{A}_{1} &= \{1,\,6,\,11,\,16,\,21\,\ldots\} \\ \mathbf{A}_{2} &= \{2,\,7,\,12,\,17,\,22,\,\ldots\} \\ \mathbf{A}_{3} &= \{3,\,8,\,13,\,18,\,23,\,\ldots\} \\ \mathbf{A}_{4} &= \{4,\,9,\,14,\,19,\,24,\,\ldots\} \end{split}$$

It is evident that the above five sets are pairwise disjoint and

$$\mathbf{A}_0 \cup \mathbf{A}_1 \cup \mathbf{A}_2 \cup \mathbf{A}_3 \cup \mathbf{A}_4 = \bigcup_{i=0}^{4} \mathbf{A}_i = \mathbf{N}.$$

**Example 13** Show that the function  $f: \mathbf{R} \to \mathbf{R}$  defined by  $f(x) = \frac{x}{x^2 + 1}, \forall x \in \mathbf{R}$ , is

neither one-one nor onto.

Solution For 
$$x_1, x_2 \in \mathbf{R}$$
, consider  
 $f(x_1) = f(x_2)$   
 $\Rightarrow \frac{x_1}{x_1^2 + 1} = \frac{x_2}{x_2^2 + 1}$   
 $\Rightarrow x_1 x_2^2 + x_1 = x_2 x_1^2 + x_2$   
 $\Rightarrow x_1 x_2 (x_2 - x_1) = x_2 - x_1$   
 $\Rightarrow x_1 = x_2 \text{ or } x_1 x_2 = 1$ 

We note that there are point,  $x_1$  and  $x_2$  with  $x_1 \neq x_2$  and  $f(x_1) = f(x_2)$ , for instance, if we take  $x_1 = 2$  and  $x_2 = \frac{1}{2}$ , then we have  $f(x_1) = \frac{2}{5}$  and  $f(x_2) = \frac{2}{5}$  but  $2 \neq \frac{1}{2}$ . Hence *f* is not one-one. Also, *f* is not onto for if so then for  $1 \in \mathbb{R} \exists x \in \mathbb{R}$  such that f(x) = 1

which gives  $\frac{x}{x^2+1}=1$ . But there is no such x in the domain **R**, since the equation  $x^2 - x + 1 = 0$  does not give any real value of x.

**Example 14** Let  $f, g : \mathbf{R} \to \mathbf{R}$  be two functions defined as f(x) = |x| + x and  $g(x) = |x| - x \quad \forall x \in \mathbf{R}$ . Then, find  $f \circ g$  and  $g \circ f$ .

**Solution** Here f(x) = |x| + x which can be redefined as

$$f(x) = \begin{cases} 2x \text{ if } x \ge 0\\ 0 \text{ if } x < 0 \end{cases}$$

Similarly, the function g defined by g(x) = |x| - x may be redefined as

$$g(x) = \begin{cases} 0 \text{ if } x \ge 0\\ -2x \text{ if } x < 0 \end{cases}$$

Therefore,  $g \circ f$  gets defined as :

For  $x \ge 0$ ,  $(g \ o \ f)$   $(x) = g \ (f \ (x) = g \ (2x) = 0$ and for x < 0,  $(g \ o \ f)$   $(x) = g \ (f \ (x) = g \ (0) = 0$ . Consequently, we have  $(g \ o \ f)$  (x) = 0,  $\forall x \in \mathbf{R}$ . Similarly,  $f \ o \ g$  gets defined as:

For  $x \ge 0$ ,  $(f \circ g)(x) = f(g(x)) = f(0) = 0$ ,

and for x < 0,  $(f \circ g)(x) = f(g(x)) = f(-2x) = -4x$ .

i.e. 
$$(f \circ g)(x) = \begin{cases} 0, x > 0 \\ -4x, x < 0 \end{cases}$$

**Example 15** Let **R** be the set of real numbers and  $f: \mathbf{R} \to \mathbf{R}$  be the function defined by f(x) = 4x + 5. Show that *f* is invertible and find  $f^{-1}$ .

**Solution** Here the function  $f : \mathbf{R} \to \mathbf{R}$  is defined as f(x) = 4x + 5 = y (say). Then

$$4x = y - 5$$
 or  $x = \frac{y - 5}{4}$ .

Get More Learning Materials Here : 💶 🥣

This leads to a function  $g : \mathbf{R} \to \mathbf{R}$  defined as

 $g(y)=\frac{y-5}{4}.$ 

Therefore,

$$=\frac{4x+5-5}{4} = x$$

or

$$g \ o \ f = I_R$$
  
 $(f \ o \ g) \ (y) = f \ (g(y))$ 

 $(g \circ f)(x) = g(f(x)) = g(4x + 5)$ 

Similarly

$$= f\left(\frac{y-5}{4}\right)$$
$$= 4\left(\frac{y-5}{4}\right) + 5 = y$$

or

Hence *f* is invertible and  $f^{-1} = g$  which is given by

$$f^{-1}(x) = \frac{x-5}{4}$$

>>>

**Example 16** Let \* be a binary operation defined on **Q**. Find which of the following binary operations are associative

 $f \circ g = I_R$ .

(i) 
$$a * b = a - b$$
 for  $a, b \in \mathbf{Q}$ .

(ii) 
$$a * b = \frac{ab}{4}$$
 for  $a, b \in \mathbf{Q}$ .

- (iii) a \* b = a b + ab for  $a, b \in \mathbf{Q}$ .
- (iv)  $a * b = ab^2$  for  $a, b \in \mathbf{Q}$ .

### **Solution**

(i) \* is not associative for if we take a = 1, b = 2 and c = 3, then
(a \* b) \* c = (1 \* 2) \* 3 = (1 − 2) \* 3 = −1 − 3 = −4 and
a \* (b \* c) = 1 \* (2 \* 3) = 1 \* (2 − 3) = 1 − (−1) = 2.

Thus  $(a * b) * c \neq a * (b * c)$  and hence \* is not associative.

- (ii) \* is associative since **Q** is associative with respect to multiplication.
- (iii) \* is not associative for if we take a = 2, b = 3 and c = 4, then (a \* b) \* c = (2 \* 3) \* 4 = (2 - 3 + 6) \* 4 = 5 \* 4 = 5 - 4 + 20 = 21, and a \* (b \* c) = 2 \* (3 \* 4) = 2 \* (3 - 4 + 12) = 2 \* 11 = 2 - 11 + 22 = 13Thus  $(a * b) * c \neq a * (b * c)$  and hence \* is not associative.
- (iv) \* is not associative for if we take a = 1, b = 2 and c = 3, then  $(a * b) * c = (1 * 2) * 3 = 4 * 3 = 4 \times 9 = 36$  and  $a * (b * c) = 1 * (2 * 3) = 1 * 18 = 1 \times 18^2 = 324$ .

Thus  $(a * b) * c \neq a * (b * c)$  and hence \* is not associative.

# **Objective Type Questions**

Choose the correct answer from the given four options in each of the Examples 17 to 25.

**Example 17** Let R be a relation on the set N of natural numbers defined by nRm if n divides m. Then R is

- (A) Reflexive and symmetric
- (C) Equivalence

- (B) Transitive and symmetric
- (D) Reflexive, transitive but not symmetric

Solution The correct choice is (D).

Since *n* divides *n*,  $\forall n \in \mathbb{N}$ , R is reflexive. R is not symmetric since for 3,  $6 \in \mathbb{N}$ , 3 R  $6 \neq 6$  R 3. R is transitive since for *n*, *m*, *r* whenever n/m and  $m/r \Rightarrow n/r$ , i.e., *n* divides *m* and *m* divides *r*, then *n* will devide *r*.

**Example 18** Let L denote the set of all straight lines in a plane. Let a relation R be defined by lRm if and only if l is perpendicular to  $m \forall l, m \in L$ . Then R is

- (A) reflexive (B) symmetric
- (C) transitive (D) none of these

**Solution** The correct choice is (B).

**Example 19** Let N be the set of natural numbers and the function  $f : N \to N$  be defined by  $f(n) = 2n + 3 \forall n \in N$ . Then f is

- (A) surjective (B) injective
- (C) bijective (D) none of these

**Solution** (B) is the correct option.

Example 20 Set A has 3 elements and the set B has 4 elements. Then the number of

**CLICK HERE** 

>>

injective mappings that can be defined from A to B is

- (A) 144 (B) 12
- (C) 24 (D) 64

Solution The correct choice is (C). The total number of injective mappings from the set containing 3 elements into the set containing 4 elements is  ${}^{4}P_{3} = 4! = 24$ .

**Example 21** Let  $f: \mathbf{R} \to \mathbf{R}$  be defined by  $f(x) = \sin x$  and  $g: \mathbf{R} \to \mathbf{R}$  be defined by  $g(x) = x^2$ , then  $f \circ g$  is

(A) 
$$x^{2} \sin x$$
 (B)  $(\sin x)^{2}$   
(C)  $\sin x^{2}$  (D)  $\frac{\sin x}{x^{2}}$ 

**Solution** (C) is the correct choice.

**Example 22** Let  $f: \mathbb{R} \to \mathbb{R}$  be defined by f(x) = 3x - 4. Then  $f^{-1}(x)$  is given by

(A)	$\frac{x+4}{3}$	(B)	$\frac{x}{3}-4$
(C)	3x + 4	(D)	None of these

**Solution** (A) is the correct choice.

**Example 23** Let  $f : \mathbf{R} \to \mathbf{R}$  be defined by  $f(x) = x^2 + 1$ . Then, pre-images of 17 and -3, respectively, are

(B)  $\{3, -3\}, \phi$ (A)  $\phi$ , {4, -4} (D)  $\{4, -4, \{2, -2\}\}$ (C)  $\{4, -4\}, \phi$ 

**Solution** (C) is the correct choice since for  $f^{-1}(17) = x \Rightarrow f(x) = 17$  or  $x^2 + 1 = 17$  $\Rightarrow x = \pm 4 \text{ or } f^{-1}(17) = \{4, -4\} \text{ and for } f^{-1}(-3) = x \Rightarrow f(x) = -3 \Rightarrow x^2 + 1$  $= -3 \Rightarrow x^2 = -4$  and hence  $f^{-1}(-3) = \phi$ .

**Example 24** For real numbers x and y, define xRy if and only if  $x - y + \sqrt{2}$  is an irrational number. Then the relation R is

(A)	reflexive	(B)	symmetric
(C)	transitive	(D)	none of these

**Solution** (A) is the correct choice.

Fill in the blanks in each of the Examples 25 to 30.

**Example 25** Consider the set  $A = \{1, 2, 3\}$  and R be the smallest equivalence relation on A, then R =\_\_\_\_\_

.....

**Solution**  $R = \{(1, 1), (2, 2), (3, 3)\}.$ 

**Example 26** The domain of the function  $f: \mathbf{R} \to \mathbf{R}$  defined by  $f(x) = \sqrt{x^2 - 3x + 2}$  is

Solution Here  $x^2 - 3x + 2 \ge 0$   $\Rightarrow (x-1)(x-2) \ge 0$  $\Rightarrow x \le 1 \text{ or } x \ge 2$ 

Hence the domain of  $f = (-\infty, 1] \cup [2, \infty)$ 

**Example 27** Consider the set A containing n elements. Then, the total number of injective functions from A onto itself is \_\_\_\_\_.

**Solution** *n*!

**Example 28** Let **Z** be the set of integers and R be the relation defined in **Z** such that aRb if a - b is divisible by 3. Then R partitions the set **Z** into \_\_\_\_\_ pairwise disjoint subsets.

Solution Three.

**Example 29** Let **R** be the set of real numbers and \* be the binary operation defined on **R** as  $a * b = a + b - ab \forall a, b \in \mathbf{R}$ . Then, the identity element with respect to the binary operation \* is \_\_\_\_\_.

**Solution** 0 is the identity element with respect to the binary operation \*.

State True or False for the statements in each of the Examples 30 to 34.

**Example 30** Consider the set  $A = \{1, 2, 3\}$  and the relation  $R = \{(1, 2), (1, 3)\}$ . R is a transitive relation.

Solution True.

**Example 31** Let A be a finite set. Then, each injective function from A into itself is not surjective.

Solution False.

**Example 32** For sets A, B and C, let  $f : A \to B$ ,  $g : B \to C$  be functions such that  $g \circ f$  is injective. Then both f and g are injective functions.

Solution False.

**Example 33** For sets A, B and C, let  $f : A \to B$ ,  $g : B \to C$  be functions such that  $g \circ f$  is surjective. Then g is surjective **Solution** True.

CLICK HERE

>>

**Example 34** Let N be the set of natural numbers. Then, the binary operation \* in N defined as a \* b = a + b,  $\forall a, b \in N$  has identity element.

Solution False.

# **1.3 EXERCISE** Short Answer (S.A.)

1. Let  $A = \{a, b, c\}$  and the relation R be defined on A as follows:

$$\mathbf{R} = \{(a, a), (b, c), (a, b)\}.$$

Then, write minimum number of ordered pairs to be added in  $\mathbf{R}$  to make  $\mathbf{R}$  reflexive and transitive.

- 2. Let D be the domain of the real valued function f defined by  $f(x) = \sqrt{25 x^2}$ . Then, write D.
- 3. Let  $f, g: \mathbf{R} \to \mathbf{R}$  be defined by f(x) = 2x + 1 and  $g(x) = x^2 2$ ,  $\forall x \in \mathbf{R}$ , respectively. Then, find  $g \circ f$ .
- 4. Let  $f : \mathbf{R} \to \mathbf{R}$  be the function defined by  $f(x) = 2x 3 \quad \forall x \in \mathbf{R}$ . write  $f^{-1}$ .
- 5. If A = {a, b, c, d} and the function  $f = \{(a, b), (b, d), (c, a), (d, c)\}$ , write  $f^{-1}$ .
- 6. If  $f : \mathbf{R} \to \mathbf{R}$  is defined by  $f(x) = x^2 3x + 2$ , write f(f(x)).
- 7. Is  $g = \{(1, 1), (2, 3), (3, 5), (4, 7)\}$  a function? If g is described by  $g(x) = \alpha x + \beta$ , then what value should be assigned to  $\alpha$  and  $\beta$ .
- 8. Are the following set of ordered pairs functions? If so, examine whether the mapping is injective or surjective.
  - (i)  $\{(x, y): x \text{ is a person, } y \text{ is the mother of } x\}$ .
  - (ii){(a, b): *a* is a person, *b* is an ancestor of *a*}.
- 9. If the mappings f and g are given by  $f = \{(1, 2), (3, 5), (4, 1)\}$  and  $g = \{(2, 3), (5, 1), (1, 3)\}$ , write f o g.
- 10. Let C be the set of complex numbers. Prove that the mapping  $f: \mathbb{C} \to \mathbb{R}$  given by  $f(z) = |z|, \forall z \in \mathbb{C}$ , is neither one-one nor onto.
- 11. Let the function  $f : \mathbf{R} \to \mathbf{R}$  be defined by  $f(x) = \cos x$ ,  $\forall x \in \mathbf{R}$ . Show that *f* is neither one-one nor onto.
- 12. Let  $X = \{1, 2, 3\}$  and  $Y = \{4, 5\}$ . Find whether the following subsets of  $X \times Y$  are functions from X to Y or not.
  - (i)  $f = \{(1, 4), (1, 5), (2, 4), (3, 5)\}$  (ii)  $g = \{(1, 4), (2, 4), (3, 4)\}$

>>

- (iii)  $h = \{(1,4), (2,5), (3,5)\}$  (iv)  $k = \{(1,4), (2,5)\}.$
- **13.** If functions  $f : A \to B$  and  $g : B \to A$  satisfy  $g \circ f = I_A$ , then show that f is one-one and g is onto.

- **14.** Let  $f : \mathbf{R} \to \mathbf{R}$  be the function defined by  $f(x) = \frac{1}{2 \cos x}$  x **R**. Then, find the range of f.
- **15.** Let *n* be a fixed positive integer. Define a relation R in Z as follows:  $a, b \in Z$ , aRb if and only if a b is divisible by *n*. Show that R is an equivalance relation.

### Long Answer (L.A.)

- **16.** If  $A = \{1, 2, 3, 4\}$ , define relations on A which have properties of being:
  - (a) reflexive, transitive but not symmetric
  - (b) symmetric but neither reflexive nor transitive
  - (c) reflexive, symmetric and transitive.
- **17.** Let R be relation defined on the set of natural number N as follows:

 $R = \{(x, y): x \in N, y \in N, 2x + y = 41\}$ . Find the domain and range of the relation R. Also verify whether R is reflexive, symmetric and transitive.

- **18.** Given  $A = \{2, 3, 4\}$ ,  $B = \{2, 5, 6, 7\}$ . Construct an example of each of the following:
  - (a) an injective mapping from A to B
  - (b) a mapping from A to B which is not injective
  - (c) a mapping from B to A.
- **19.** Give an example of a map
  - (i) which is one-one but not onto
  - (ii) which is not one-one but onto
  - (iii) which is neither one-one nor onto.

**20.** Let A = **R** - {3}, B = **R** - {1}. Let  $f : A \to B$  be defined by  $f(x) = \frac{x-2}{x-3}$ 

x = A. Then show that f is bijective.

**21.** Let A = [-1, 1]. Then, discuss whether the following functions defined on A are one-one, onto or bijective:

**CLICK HERE** 

(i)  $f(x) = \frac{x}{2}$  (ii) g(x) = |x|

(iii) 
$$h(x) = x^{2}$$
.

22. Each of the following defines a relation on N:

- (i) x is greater than y, x, y **N**
- (ii) x + y = 10, x, y **N**

- (iii) x y is square of an integer  $x, y \in \mathbf{N}$
- (iv) x + 4y = 10 x, y N.

Determine which of the above relations are reflexive, symmetric and transitive.

- **23.** Let  $A = \{1, 2, 3, ..., 9\}$  and R be the relation in A ×A defined by (a, b) R (c, d) if a + d = b + c for (a, b), (c, d) in A ×A. Prove that R is an equivalence relation and also obtain the equivalent class [(2, 5)].
- 24. Using the definition, prove that the function  $f: A \rightarrow B$  is invertible if and only if f is both one-one and onto.
- 25. Functions  $f, g: \mathbf{R} \to \mathbf{R}$  are defined, respectively, by  $f(x) = x^2 + 3x + 1$ , g(x) = 2x 3, find
  - (i)  $f \circ g$  (ii)  $g \circ f$  (iii)  $f \circ f$  (iv)  $g \circ g$
- 26. Let \* be the binary operation defined on **Q**. Find which of the following binary operations are commutative
  - (i) a \* b = a b  $a, b \in \mathbf{Q}$  (ii)  $a * b = a^2 + b^2$   $a, b \in \mathbf{Q}$

(iii) 
$$a * b = a + ab$$
  $a, b \in \mathbf{Q}$  (iv)  $a * b = (a - b)^2$   $a, b \in \mathbf{Q}$ 

- **27.** Let \* be binary operation defined on **R** by a \* b = 1 + ab,  $a, b \in \mathbf{R}$ . Then the operation \* is
  - (i) commutative but not associative
  - (ii) associative but not commutative
  - (iii) neither commutative nor associative
  - (iv) both commutative and associative

### **Objective Type Questions**

Choose the correct answer out of the given four options in each of the Exercises from 28 to 47 (M.C.Q.).

- **28.** Let T be the set of all triangles in the Euclidean plane, and let a relation R on T be defined as aRb if a is congruent to  $b = a, b \in T$ . Then R is
  - (A) reflexive but not transitive (B) transitive but not symmetric
  - (C) equivalence (D) none of these
- **29.** Consider the non-empty set consisting of children in a family and a relation R defined as *a*R*b* if *a* is brother of *b*. Then R is
  - (A) symmetric but not transitive (B) transitive but not symmetric
  - (C) neither symmetric nor transitive (D) both symmetric and transitive

30.		The maximum number of equivalence relations on the set $A = \{1, 2, 3\}$ are				
	(A)		(B)			
	(C)		(D)			
31.	If a	If a relation R on the set $\{1, 2, 3\}$ be defined by $R = \{(1, 2)\}$ , then R is				
	(A)	reflexive	(B)	transitive		
	(C)	symmetric	(D)	none of these		
32.	Let	Let us define a relation R in <b>R</b> as $aRb$ if $a \ge b$ . Then R is				
	(A)	an equivalence relation	(B)	reflexive, transitive but not symmetric		
	(C)	symmetric, transitive but not reflexive	(D)	neither transitive nor reflexive but symmetric.		
33.	Let	$A = \{1, 2, 3\}$ and consider the relation				
	$R = \{1, 1\}, (2, 2), (3, 3), (1, 2), (2, 3), (1,3)\}.$ Then R is					
	(A)	reflexive but not symmetric	(B)	reflexive but not transitive		
	(C)	symmetric and transitive	(D)	neither symmetric, nor transitive		
34.	The	The identity element for the binary operation $*$ defined on Q $\sim \{0\}$ as				
	$a * b = \frac{ab}{2}$ $a, b \in \mathbb{Q} \sim \{0\}$ is					
	(A)	1	(B)	0		
	(C)	2	(D)	none of these		
35.		If the set A contains 5 elements and the set B contains 6 elements, then the number of one-one and onto mappings from A to B is				
	(A)	720	(B)	120		
	(C)	0	(D)	none of these		
36.	Let A B is	Let A = $\{1, 2, 3,n\}$ and B = $\{a, b\}$ . Then the number of surjections from A				
	(A)	${}^{n}\mathrm{P}_{2}$	(B)	$2^{n} - 2$		
	(C)	$2^{n} - 1$	(D)	None of these

**37.** Let  $f : \mathbf{R} \to \mathbf{R}$  be defined by  $f(x) = \frac{1}{x}$   $x \in \mathbf{R}$ . Then f is (A) one-one (B) onto (C) bijective (D) f is not defined

**38.** Let  $f : \mathbf{R} \to \mathbf{R}$  be defined by  $f(x) = 3x^2 - 5$  and  $g : \mathbf{R} \to \mathbf{R}$  by  $g(x) = \frac{x}{x^2 + 1}$ . Then  $g \circ f$  is

(A)  $\frac{3x^2 - 5}{9x^4 - 30x^2 + 26}$  (B)  $\frac{3x^2 - 5}{9x^4 - 6x^2 + 26}$  $3x^2$ 

(C) 
$$\frac{3x}{x^4 + 2x^2 - 4}$$
 (D)  $\frac{3x}{9x^4 + 30x^2 - 2}$ 

**39.** Which of the following functions from  $\mathbf{Z}$  into  $\mathbf{Z}$  are bijections?

(A)  $f(x) = x^3$ (B) f(x) = x + 2(C) f(x) = 2x + 1(D)  $f(x) = x^2 + 1$ 

**40.** Let  $f : \mathbf{R} \to \mathbf{R}$  be the functions defined by  $f(x) = x^3 + 5$ . Then  $f^{-1}(x)$  is

(A)  $(x+5)^{\frac{1}{3}}$  (B)  $(x-5)^{\frac{1}{3}}$ (C)  $(5-x)^{\frac{1}{3}}$  (D) 5-x

**41.** Let  $f: A \to B$  and  $g: B \to C$  be the bijective functions. Then  $(g \circ f)^{-1}$  is

(A)  $f^{-1} \circ g^{-1}$ (B)  $f \circ g$ (D)  $g \circ f$ 42. Let  $f: \mathbf{R} - \left\{ \frac{3}{5} \right\} \to \mathbf{R}$  be defined by  $f(x) = \frac{3x+2}{5x-3}$ . Then (A)  $f^{-1}(x) = f(x)$ (B)  $f^{-1}(x) = -f(x)$ (C)  $(f \circ f) x = -x$ (B)  $f^{-1}(x) = -f(x)$ (C)  $(f \circ f) x = -x$ (D)  $f^{-1}(x) = \frac{1}{19}f(x)$ 43. Let  $f: [0, 1] \to [0, 1]$  be defined by  $f(x) = \begin{cases} x, \text{if } x \text{ is rational} \\ 1-x, \text{ if } x \text{ is irrational} \end{cases}$ 

Then  $(f \circ f) x$  is (B) 1 + x(A) constant (C) (D) none of these х **44.** Let  $f: [2, \infty) \rightarrow \mathbf{R}$  be the function defined by  $f(x) = x^2 - 4x + 5$ , then the range of f is (A) R (B) [1,∞) (B) [5,∞) (C) [4,∞) 45. Let  $f: \mathbf{N} \to \mathbf{R}$  be the function defined by  $f(x) = \frac{2x-1}{2}$  and  $g: \mathbf{Q} \to \mathbf{R}$  be another function defined by g(x) = x + 2. Then  $(g \circ f) \frac{3}{2}$  is (A) 1 (B) 1 (C) (B) none of these **46.** Let  $f : \mathbf{R} \to \mathbf{R}$  be defined by  $f(x) = \begin{cases} 2x: x > 3\\ x^2: 1 < x \le 3\\ 3x: x \le 1 \end{cases}$ Then f(-1) + f(2) + f(4) is (A) 9 (B) 14 5 (D) none of these (C) 47. Let  $f: \mathbf{R} \to \mathbf{R}$  be given by  $f(x) = \tan x$ . Then  $f^{-1}(1)$  is (B)  $\{n \pi + \frac{\pi}{4} : n \in \mathbb{Z}\}$ (A) does not exist (C) (D) none of these Fill in the blanks in each of the Exercises 48 to 52. **48.** Let the relation R be defined in N by aRb if 2a + 3b = 30. Then R = \_\_\_\_\_.

49. Let the relation R be defined on the set

A = {1, 2, 3, 4, 5} by R = { $(a, b) : |a^2 - b^2| < 8$ . Then R is given by \_\_\_\_\_.

**50.** Let  $f = \{(1, 2), (3, 5), (4, 1) \text{ and } g = \{(2, 3), (5, 1), (1, 3)\}$ . Then  $g \circ f =$  \_\_\_\_\_ and  $f \circ g =$  \_\_\_\_\_.

>>>

**51.** Let 
$$f : \mathbf{R} \to \mathbf{R}$$
 be defined by  $f(x) = \frac{x}{\sqrt{1 + x^2}}$ . Then  $(f \circ f \circ f)(x) = -----$   
**52.** If  $f(x) = (4 - (x - 7)^3)$ , then  $f^{-1}(x) = ----$ .

State True or False for the statements in each of the Exercises 53 to 63.

- 53. Let  $R = \{(3, 1), (1, 3), (3, 3)\}$  be a relation defined on the set  $A = \{1, 2, 3\}$ . Then R is symmetric, transitive but not reflexive.
- 54. Let  $f : \mathbf{R} \to \mathbf{R}$  be the function defined by  $f(x) = \sin(3x+2)$   $x \in \mathbf{R}$ . Then *f* is invertible.
- 55. Every relation which is symmetric and transitive is also reflexive.
- 56. An integer m is said to be related to another integer n if m is a integral multiple of n. This relation in  $\mathbb{Z}$  is reflexive, symmetric and transitive.
- 57. Let A = {0, 1} and N be the set of natural numbers. Then the mapping  $f: \mathbf{N} \to \mathbf{A}$  defined by  $f(2n-1) = 0, f(2n) = 1, n \in \mathbf{N}$ , is onto.
- **58.** The relation R on the set  $A = \{1, 2, 3\}$  defined as  $R = \{\{1, 1), (1, 2), (2, 1), (3, 3)\}$  is reflexive, symmetric and transitive.
- **59.** The composition of functions is commutative.
- **60.** The composition of functions is associative.
- **61.** Every function is invertible.
- 62. A binary operation on a set has always the identity element.
