

5.1 Overview

5.1.1 Continuity of a function at a point

Let f be a real function on a subset of the real numbers and let c be a point in the domain of f. Then f is continuous at c if

$$\lim_{x \to c} f(x) = f(c)$$

More elaborately, if the left hand limit, right hand limit and the value of the function at x = c exist and are equal to each other, i.e.,

$$\lim_{x \to c} f(x) \quad f(c) \quad \lim_{x \to c} f(x)$$

then *f* is said to be continuous at x = c.

5.1.2 Continuity in an interval

- (i) *f* is said to be continuous in an open interval (*a*, *b*) if it is continuous at every point in this interval.
- (ii) f is said to be continuous in the closed interval [a, b] if
 - f is continuous in (a, b)

•
$$\lim_{x \to a^+} f(x) = f(a)$$

• $\lim_{x \to b^-} f(x) = f(b)$

5.1.3 Geometrical meaning of continuity

- (i) Function f will be continuous at x = c if there is no break in the graph of the function at the point (c, f(c)).
- (ii) In an interval, function is said to be continuous if there is no break in the graph of the function in the entire interval.

5.1.4 Discontinuity

The function *f* will be discontinuous at x = a in any of the following cases :

- (i) $\lim_{x\to a^-} f(x)$ and $\lim_{x\to a^+} f(x)$ exist but are not equal.
- (ii) $\lim_{x\to a^-} f(x)$ and $\lim_{x\to a^+} f(x)$ exist and are equal but not equal to f(a).
- (iii) f(a) is not defined.

5.1.6 Continuity of composite functions

Let f and g be real valued functions such that (fog) is defined at a. If g is continuous at a and f is continuous at g (a), then (fog) is continuous at a.

5.1.7 Differentiability

The function defined by $f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$, wherever the limit exists, is defined to be the derivative of *f* at *x*. In other words, we say that a function *f* is differentiable at a point *c* in its domain if both $\lim_{h \to 0^-} \frac{f(c+h) - f(c)}{h}$, called left hand

derivative, denoted by Lf'(c), and $\lim_{h\to 0^+} \frac{f(c+h) - f(c)}{h}$, called right hand derivative, denoted by Rf'(c), are finite and equal.

- (i) The function y = f(x) is said to be differentiable in an open interval (a, b) if it is differentiable at every point of (a, b)
- (ii) The function y = f(x) is said to be differentiable in the closed interval [a, b] if R f'(a) and L f'(b) exist and f'(x) exists for every point of (a, b).
- (iii) Every differentiable function is continuous, but the converse is not true

5.1.8 Algebra of derivatives

If *u*, *v* are functions of *x*, then

(i)
$$\frac{d(u \pm v)}{dx} = \frac{du}{dx} \pm \frac{dv}{dx}$$
 (ii) $\frac{d}{dx}(uv) = u\frac{dv}{dx} + v\frac{du}{dx}$

(iii)
$$\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v\frac{du}{dx} - u\frac{dv}{dx}}{v^2}$$

5.1.9 Chain rule is a rule to differentiate composition of functions. Let f = vou. If t = u(x) and both $\frac{dt}{dx}$ and $\frac{dv}{dt}$ exist then $\frac{df}{dx} = \frac{dv}{dt}$. $\frac{dt}{dx}$

5.1.10 Following are some of the standard derivatives (in appropriate domains)

1.
$$\frac{d}{dx}(\sin^{-1}x) = \frac{1}{\sqrt{1-x^2}}$$

2. $\frac{d}{dx}(\cos^{-1}x) = \frac{-1}{\sqrt{1-x^2}}$
3. $\frac{d}{dx}(\tan^{-1}x) = \frac{1}{1+x^2}$
4. $\frac{d}{dx}(\cot^{-1}x) = \frac{-1}{1+x^2}$
5. $\frac{d}{dx}(\sec^{-1}x) = \frac{1}{|x|\sqrt{x^2-1}}, |x| > 1$
6. $\frac{d}{dx}(\csc^{-1}x) = \frac{-1}{|x|\sqrt{x^2-1}}, |x| > 1$

5.1.11 Exponential and logarithmic functions

- (i) The exponential function with positive base b > 1 is the function $y = f(x) = b^x$. Its domain is **R**, the set of all real numbers and range is the set of all positive real numbers. Exponential function with base 10 is called the common exponential function and with base *e* is called the natural exponential function.
- (ii) Let b > 1 be a real number. Then we say logarithm of *a* to base *b* is *x* if $b^x = a$, Logarithm of *a* to the base *b* is denoted by $\log_b a$. If the base b = 10, we say it is common logarithm and if b = e, then we say it is natural logarithms. log*x* denotes the logarithm function to base *e*. The domain of logarithm function is \mathbf{R}^+ , the set of all positive real numbers and the range is the set of all real numbers.
- (iii) The properties of logarithmic function to any base b > 1 are listed below:

$$1. \log_b (xy) = \log_b x + \log_b y$$

2.
$$\log_b\left(\frac{x}{y}\right) = \log_b x - \log_b y$$

4. $\log_b x = \frac{\log_c x}{\log_c b}$, where $c > c$

5.
$$\log_b x = \frac{1}{\log_x b}$$

6. $\log_b b = 1$ and $\log_b 1 = 0$

(iv) The derivative of
$$e^x$$
 w.r.t., x is e^x , i.e. $\frac{d}{dx}(e^x) = e^x$. The derivative of logx

1

w.r.t., x is
$$\frac{1}{x}$$
; i.e. $\frac{d}{dx}(\log x) = \frac{1}{x}$.

5.1.12 Logarithmic differentiation is a powerful technique to differentiate functions of the form $f(x) = (u(x))^{\nu(x)}$, where both f and u need to be positive functions for this technique to make sense.

5.1.13 Differentiation of a function with respect to another function

Let u = f(x) and v = g(x) be two functions of x, then to find derivative of f(x) w.r.t. to g(x), i.e., to find $\frac{du}{dv}$, we use the formula

$$\frac{du}{dv} = \frac{\frac{du}{dx}}{\frac{dv}{dx}}$$

5.1.14 Second order derivative

 $\frac{d}{dx} \frac{dy}{dx} = \frac{d^2y}{dx^2}$ is called the second order derivative of y w.r.t. x. It is denoted by y'' or y_2 , if y = f(x).

5.1.15 Rolle's Theorem

Let f: [a, b] **R** be continuous on [a, b] and differentiable on (a, b), such that f(a) = f(b), where a and b are some real numbers. Then there exists at least one point c in (a, b) such that f'(c) = 0.

CLICK HERE

Geometrically Rolle's theorem ensures that there is at least one point on the curve y = f(x) at which tangent is parallel to x-axis (abscissa of the point lying in (a, b)).

5.1.16 Mean Value Theorem (Lagrange)

Let f: [a, b] **R** be a continuous function on [a, b] and differentiable on (a, b). Then

there exists at least one point c in (a, b) such that $f'(c) = \frac{f(b) - f(a)}{b - a}$.

Geometrically, Mean Value Theorem states that there exists at least one point c in (a, b) such that the tangent at the point (c, f(c)) is parallel to the secant joining the points (a, f(a) and (b, f(b)).

5.2 Solved Examples

Short Answer (S.A.)

Example 1 Find the value of the constant k so that the function f defined below is

continuous at
$$x = 0$$
, where $f(x) = \begin{cases} \frac{1 - \cos 4x}{8x^2}, & x \neq 0\\ k, & x = 0 \end{cases}$.

Solution It is given that the function f is continuous at x = 0. Therefore, $\lim_{x \to 0} f(x) = f(0)$

 $\Rightarrow \qquad \lim_{x \to 0} \frac{1 - \cos 4x}{8x^2} = k$ $\Rightarrow \qquad \lim_{x \to 0} \frac{2 \sin^2 2x}{8x^2} = k$ $\Rightarrow \qquad \lim_{x \to 0} \left(\frac{\sin 2x}{2x}\right)^2 = k$ $\Rightarrow \qquad k = 1$

Thus, *f* is continuous at x = 0 if k = 1.

Example 2 Discuss the continuity of the function $f(x) = \sin x \cdot \cos x$.

Solution Since sin *x* and cos *x* are continuous functions and product of two continuous function is a continuous function, therefore $f(x) = \sin x \cdot \cos x$ is a continuous function.

Example 3 If
$$f(x) = \begin{cases} \frac{x^3 + x^2 - 16x + 20}{(x-2)^2}, & x \neq 2 \\ k, & x = 2 \end{cases}$$
 is continuous at $x = 2$, find

the value of *k*. **Solution** Given f(2) = k.

 \Rightarrow

Now, $\lim_{x \to 2^{-}} f(x) = \lim_{x \to 2^{+}} f(x) = \lim_{x \to 2} \frac{x^3 + x^2 - 16x + 20}{(x-2)^2}$

$$= \lim_{x \to 2} \frac{(x - 5)(x - 2)^2}{(x - 2)^2} \quad \lim_{x \to 2} (x - 5) = 7$$

As *f* is continuous at x = 2, we have

$$\lim_{x \to 2} f(x) = f(2)$$

k = 7.

Example 4 Show that the function *f* defined by

$$f(x) = \begin{cases} x \sin \frac{1}{x}, & x \neq 0\\ 0, & x = 0 \end{cases}$$

is continuous at x = 0. **Solution** Left hand limit at x = 0 is given by

$$\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0^{-}} x \sin \frac{1}{x} = 0 \qquad [\text{since, } -1 < \sin \frac{1}{x} < 1]$$

Similarly $\lim_{x \to 0} f(x) = \lim_{x \to 0} x \sin \frac{1}{x} = 0$. Moreover $f(0) = 0$.
Thus $\lim_{x \to 0^{-}} f(x) = \lim_{x \to 0} f(x) = f(0)$. Hence f is continuous at $x = 0$
Example 5 Given $f(x) = \frac{1}{x-1}$. Find the points of discontinuity of the composite function $y = f[f(x)]$.
Solution We know that $f(x) = \frac{1}{x-1}$ is discontinuous at $x = 1$

>>>

1

Now, for x = 1,

$$f(f(x)) = f \frac{1}{x-1} = \frac{1}{\frac{1}{x-1}-1} \frac{x-1}{2-x}$$

which is discontinuous at x = 2.

Hence, the points of discontinuity are x = 1 and x = 2.

Example 6 Let f(x) = x |x|, for all $x \in \mathbf{R}$. Discuss the derivability of f(x) at x = 0

Solution We may rewrite f as
$$f(x) = \begin{cases} x^2, \text{ if } x \ge 0\\ -x^2, \text{ if } x < 0 \end{cases}$$

Now
$$Lf'(0) = \lim_{h \to 0^-} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0^-} \frac{-h^2 - 0}{h} = \lim_{h \to 0^-} -h = 0$$

Now $\operatorname{R} f'(0) = \lim_{h \to 0^+} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0^+} \frac{h^2 - 0}{h} = \lim_{h \to 0^-} h = 0$

Since the left hand derivative and right hand derivative both are equal, hence f is differentiable at x = 0.

Example 7 Differentiate $\sqrt{\tan \sqrt{x}}$ w.r.t. x Solution Let $y = \sqrt{\tan \sqrt{x}}$. Using chain rule, we have

$$\frac{dy}{dx} = \frac{1}{2\sqrt{\tan\sqrt{x}}} \cdot \frac{d}{dx} (\tan\sqrt{x})$$
$$= \frac{1}{2\sqrt{\tan\sqrt{x}}} \cdot \sec^2\sqrt{x} \frac{d}{dx} (\sqrt{x})$$
$$= \frac{1}{2\sqrt{\tan\sqrt{x}}} (\sec^2\sqrt{x}) \frac{1}{2\sqrt{x}}$$
$$= \frac{(\sec^2\sqrt{x})}{4\sqrt{x}\sqrt{\tan\sqrt{x}}}.$$

Example 8 If $y = \tan(x + y)$, find $\frac{dy}{dx}$.

Solution Given $y = \tan(x + y)$. differentiating both sides w.r.t. *x*, we have

Get More Learning Materials Here : 🗾 🥣

$$\frac{dy}{dx} = \sec^2(x - y)\frac{d}{dx}(x - y)$$
$$= \sec^2(x + y) - 1 - \frac{dy}{dx}$$

 $[1 - \sec^2(x+y)] \frac{dy}{dx} = \sec^2(x+y)$ or

Therefore, $\frac{dy}{dx} = \frac{\sec^2(x \ y)}{1 \ \sec^2(x \ y)} = -\csc^2(x + y).$

Example 9 If $e^x + e^y = e^{x+y}$, prove that

$$\frac{dy}{dx} = -e^{y-x}.$$

Solution Given that $e^x + e^y = e^{x+y}$. Differentiating both sides w.r.t. *x*, we have

$$e^{x} + e^{y}\frac{dy}{dx} = e^{x+y} \quad 1 \quad \frac{dy}{dx}$$
$$(e^{y} - e^{x} + y)\frac{dy}{dx} = e^{x} + y - e^{x},$$

or

which implies that $\frac{dy}{dx} = \frac{e^{x-y} - e^x}{e^y - e^{x-y}} = \frac{e^x}{e^y} - \frac{e^x}{e^y} - e^{y-x}$.

Example 10 Find
$$\frac{dy}{dx}$$
, if $y = \tan^{-1}\left(\frac{3x - x^3}{1 - 3x^2}\right), -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}$.

Solution Put $x = \tan \theta$, where $\frac{-\pi}{6} < \theta < \frac{\pi}{6}$.

Therefore,
$$y = \tan^{-1} \left(\frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right)$$

= $\tan^{-1} (\tan 3)$
= 3 (because $\frac{1}{2}$ (3) $\frac{1}{2}$)
= $3 \tan^{-1} x$

Hence,

$$\frac{dy}{dx} = \frac{3}{1 x^2}$$

Example 11 If $y = \sin^{-1} x \sqrt{1 x} \sqrt{x} \sqrt{1 x^2}$ and 0 < x < 1, then find $\frac{dy}{dx}$. Solution We have $y = \sin^{-1} x \sqrt{1 x} \sqrt{x} \sqrt{1 x^2}$, where 0 < x < 1.

Put
$$x = \sin A$$
 and $\sqrt{x} = \sin B$

Therefore, $y = \sin^{-1} \sin A \sqrt{1 \sin^2 B} \sin B \sqrt{1 \sin^2 A}$ = $\sin^{-1} \sin A \cos B \sin B \cos A$

$$= \sin^{-1} \sin A \cos B \sin B \cos A$$

$$=\sin^{-1}\sin(A B) = A - B$$

Thus $y = \sin^{-1} x - \sin^{-1} \sqrt{x}$

Differentiating w.r.t. *x*, we get

$$\frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}} \frac{1}{\sqrt{1 - \sqrt{x^2}}} \frac{d}{dx} \sqrt{x}$$
$$= \frac{1}{\sqrt{1 - x^2}} \frac{1}{2\sqrt{x}\sqrt{1 - x}}.$$

Example 12 If $x = a \sec^3$ and $y = a \tan^3$, find $\frac{dy}{dx}$ at $\frac{1}{3}$. Solution We have $x = a \sec^3$ and $y = a \tan^3$.

Differentiating w.r.t. , we get

$$\frac{dx}{d} = 3a \sec^2 \frac{d}{d} (\sec) = 3a \sec^3 \tan^2 \theta \frac{d}{d\theta} (\tan \theta) = 3a \tan^2 \theta \sec^2 \theta$$

and

Thus
$$\frac{dy}{dx} = \frac{\frac{dy}{d}}{\frac{dx}{d}} = \frac{3a\tan^2 \sec^2}{3a\sec^3 \tan} = \frac{\tan}{\sec} \sin^2$$

Hence,
$$\frac{dy}{dx} = \sin \frac{\sqrt{3}}{2}$$
.

Example 13 If $x^y = e^{x-y}$, prove that $\frac{dy}{dx} = \frac{\log x}{(1 - \log x)^2}$.

Solution We have $x^y = e^{x-y}$. Taking logarithm on both sides, we get $y \log x = x - y$

$$\Rightarrow$$

i.e.

$$y \log x = x - y$$
$$y (1 + \log x) = x$$
$$y = \frac{x}{1 \log x}$$

Differentiating both sides w.r.t. x, we get

$$\frac{dy}{dx} = \frac{(1 \log x) \cdot 1 - x - \frac{1}{x}}{(1 \log x)^2} = \frac{\log x}{(1 - \log x)^2}$$

Example 14 If $y = \tan x + \sec x$, prove that $\frac{d^2 y}{dx^2} = \frac{\cos x}{(1 \sin x)^2}$.

Solution We have $y = \tan x + \sec x$. Differentiating w.r.t. *x*, we get

$$\frac{dy}{dx} = \sec^2 x + \sec x \tan x$$
$$= \frac{1}{\cos^2 x} \frac{\sin x}{\cos^2 x} = \frac{1}{\cos^2 x} \frac{\sin x}{\cos^2 x} = \frac{1+\sin x}{(1+\sin x)(1-\sin x)}.$$
thus $\frac{dy}{dx} = \frac{1}{1-\sin x}.$

Now, differentiating again w.r.t. x, we get

$$\frac{d^2 y}{dx^2} = \frac{-\cos x}{(1-\sin x)^2} \frac{\cos x}{(1-\sin x)^2}$$
Example 15 If $f(x) = |\cos x|$, find $f'(\frac{3}{4})$

Get More Learning Materials Here :

Solution When $\frac{1}{2} < x < \pi$, $\cos x < 0$ so that $|\cos x| = -\cos x$, i.e., $f(x) = -\cos x$ $f'(x) = \sin x$.

Hence, $f' = \frac{3}{4} = \sin \frac{3}{4} = \frac{1}{\sqrt{2}}$

Example 16 If $f(x) = |\cos x - \sin x|$, find $f'(\frac{1}{6})$.

Solution When $0 < x < \frac{\pi}{4}$, $\cos x > \sin x$, so that $\cos x - \sin x > 0$, i.e., $f(x) = \cos x - \sin x$ $f'(x) = -\sin x - \cos x$

Hence $f' = -\sin \frac{1}{6} - \cos \frac{1}{6} = -\frac{1}{2}(1+\sqrt{3})$.

Example 17 Verify Rolle's theorem for the function, $f(x) = \sin 2x$ in $0, \frac{1}{2}$.

Solution Consider $f(x) = \sin 2x$ in $0, \frac{1}{2}$. Note that:

- (i) The function f is continuous in $0, \frac{1}{2}$, as f is a sine function, which is always continuous.
- (ii) $f'(x) = 2\cos 2x$, exists in $0, \frac{\pi}{2}$, hence f is derivable in $\left(0, \frac{\pi}{2}\right)$.

(iii)
$$f(0) = \sin 0 = 0$$
 and $f(\frac{\pi}{2}) = \sin \pi = 0 \Rightarrow f(0) = f(\frac{\pi}{2})$

Conditions of Rolle's theorem are satisfied. Hence there exists at least one $c \in [0, \frac{1}{2}]$ such that f'(c) = 0. Thus

$$2\cos 2c = 0 \implies 2c = \frac{1}{2} \implies c = \frac{1}{4}.$$

Example 18 Verify mean value theorem for the function f(x) = (x-3)(x-6)(x-9) in [3, 5].

Solution (i) Function f is continuous in [3, 5] as product of polynomial functions is a polynomial, which is continuous.

(ii) $f'(x) = 3x^2 - 36x + 99$ exists in (3, 5) and hence derivable in (3, 5).

Thus conditions of mean value theorem are satisfied. Hence, there exists at least one $c \in (3, 5)$ such that

$$f(c) \quad \frac{f(5) \quad f(3)}{5 \quad 3} \\ \Rightarrow 3c^2 - 36c + 99 = \frac{8 \quad 0}{2} = 4 \\ \Rightarrow c = 6 \quad \sqrt{\frac{13}{3}} .$$

Hence c 6 $\sqrt{\frac{13}{3}}$ (since other value is not permissible).

Long Answer (L.A.)

Example 19 If
$$f(x) = \frac{\sqrt{2}\cos x + 1}{\cot x + 1}, x = \frac{4}{4}$$

find the value of f(x) so that f(x) becomes continuous at $x = \frac{1}{4}$.

Solution Given,
$$f(x) = \frac{\sqrt{2}\cos x - 1}{\cot x - 1}, x = \frac{4}{4}$$

Therefore,

$$\lim_{x \to \frac{\pi}{4}} f(x) \lim_{x \to \frac{\pi}{4}} \frac{\sqrt{2}\cos x - 1}{\cot x - 1}$$

$$= \lim_{x \to \frac{\pi}{4}} \frac{\cos 2x}{\cos 2x} \cdot \left(\frac{\cos x + \sin x}{\sqrt{2}\cos x + 1}\right) \cdot (\sin x)$$
$$= \lim_{x \to \frac{\pi}{4}} \frac{\cos x \sin x}{\sqrt{2}\cos x + 1} \sin x$$
$$= \frac{\frac{1}{\sqrt{2}}}{\frac{\sqrt{2}}{\sqrt{2}}\cdot\frac{1}{\sqrt{2}}}{\frac{1}{\sqrt{2}}} \frac{1}{\sqrt{2}} \frac{1}{2}$$
$$\lim_{x \to \frac{\pi}{4}} f(x) = \frac{1}{2}$$

Thus,

If we define $f\left(\frac{\pi}{4}\right) = \frac{1}{2}$, then f(x) will become continuous at $x = \frac{\pi}{4}$. Hence for f to be continuous at $x = \frac{\pi}{4}$, $f = \frac{1}{2}$.

Example 20 Show that the function f given by $f(x) = \frac{e^{\frac{1}{x}} - 1}{e^{\frac{1}{x}} - 1}$, if x = 00, if x = 0

is discontinuous at x = 0.

Solution The left hand limit of f at x = 0 is given by

$$\lim_{x \to 0} f(x) \quad \lim_{x \to 0} \frac{\frac{1}{x}}{\frac{1}{e^x}} \frac{1}{1} \quad \frac{0}{0} \frac{1}{1} = 1$$

Similarly,
$$\lim_{x \to 0} f(x) \quad \lim_{x \to 0} \frac{e^{\overline{x}}}{e^{\overline{x}}} \frac{1}{1}$$

$$= \lim_{x \to 0} \frac{1 \cdot \frac{1}{\frac{1}{x}}}{1 \cdot \frac{1}{\frac{1}{e^{x}}}} = \lim_{x \to 0} \frac{1 \cdot \frac{e^{1}}{x}}{1 \cdot \frac{1}{e^{x}}} \cdot \frac{1 \cdot 0}{1 \cdot 0} \cdot 1$$

1

Thus $\lim_{x\to 0^-} f(x) \neq \lim_{x\to 0^+} f(x)$, therefore, $\lim_{x\to 0} f(x)$ does not exist. Hence f is discontinuous at x = 0.

Example 21 Let

and right hand limit of f at 0 is

$$\lim_{x \to 0} f(x) \lim_{x \to 0} \frac{\sqrt{x}}{\sqrt{16} \sqrt{x} - 4}$$
$$= \lim_{x \to 0} \frac{\sqrt{x}(\sqrt{16} \sqrt{x} - 4)}{(\sqrt{16} \sqrt{x} - 4)(\sqrt{16} \sqrt{x} - 4)}$$

$$= \lim_{x \to 0} \frac{\sqrt{x} (\sqrt{16} \sqrt{x} 4)}{16 \sqrt{x} 16} \lim_{x \to 0} \sqrt{16} \sqrt{x} 4 8$$

Thus, $\lim_{x \to 0} f(x) = \lim_{x \to 0} f(x) = 8$. Hence f is continuous at x = 0 only if a = 8. **Example 22** Examine the differentiability of the function f defined by

Solution The only doubtful points for differentiability of f(x) are x = -2 and x = 0. Differentiability at x = -2.

Now
$$\operatorname{L} f'(-2) = \lim_{h \to 0} \frac{f(-2 - h) - f(-2)}{h}$$

$$= \lim_{h \to 0} \frac{2(-2 - h) - 3 - (-2 - 1)}{h} - \lim_{h \to 0} \frac{2h}{h} - \lim_{h \to 0} 2 - 2.$$
and $\operatorname{R} f'(-2) = \lim_{h \to 0} \frac{f(-2 - h) - f(-2)}{h}$

$$= \lim_{h \to 0} \frac{-2 - h - 1 - (-2 - 1)}{h}$$

$$= \lim_{h \to 0} \frac{h - 1 - (-1)}{h} - \lim_{h \to 0} \frac{h}{h} - 1$$
Thus $\operatorname{R} f(-2) = f(-2) = f(-2)$.

Thus R $f'(-2) \neq L f'(-2)$. Therefore f is not differentiable at x = -2. Similarly, for differentiability at x = 0, we have

$$L(f'(0)) = \lim_{h \to 0} \frac{f(0 \ h) \ f(0)}{h}$$
$$= \lim_{h \to 0} \frac{0 \ h \ 1 \ (0 \ 2)}{h}$$
$$= \lim_{h \to 0} \frac{h \ 1}{h} \lim_{h \to 0} 1 \ \frac{1}{h}$$

which does not exist. Hence *f* is not differentiable at x = 0.

Example 23 Differentiate
$$\tan^{-1} \frac{\sqrt{1-x^2}}{x}$$
 with respect to $\cos^{-1} 2x\sqrt{1-x^2}$, where
 $x = \frac{1}{\sqrt{2}}, 1$.
Solution Let $u = \tan^{-1} \frac{\sqrt{1-x^2}}{x}$ and $v = \cos^{-1} 2x\sqrt{1-x^2}$.
We want to find $\frac{du}{dv} = \frac{du}{dx}$
Now $u = \tan^{-1} \frac{\sqrt{1-x^2}}{x}$. Put $x = \sin\theta$. $\left(\frac{\pi}{4} < \theta < \frac{\pi}{2}\right)$.
Then $u = \tan^{-1} \frac{\sqrt{1-\sin^2}}{\sin} = \tan^{-1}(\cot\theta)$
 $= \tan^{-1} \left\{ \tan\left(\frac{\pi}{2} - \theta\right) \right\} = \frac{\pi}{2} - \theta = \frac{\pi}{2} \sin^{-1} x$
Hence $\frac{du}{dx} = \frac{1}{\sqrt{1-x^2}}$.
Now $v = \cos^{-1}(2x\sqrt{1-x^2})$
 $= \frac{\pi}{2} - \sin^{-1}(2x\sqrt{1-x^2})$
 $= \frac{\pi}{2} - \sin^{-1}(2\sin\theta\sqrt{1-\sin^2\theta}) = \frac{\pi}{2} - \sin^{-1}(\sin 2\theta)$
 $= \frac{\pi}{2} - \sin^{-1}(\sin(\pi - 2\theta))$ [since $\frac{\pi}{2} < 2\theta < \pi$]

$$= \frac{1}{2} (2) \frac{1}{2} 2$$

$$\Rightarrow \qquad v = \frac{1}{2} + 2\sin^{-1}x$$

$$\Rightarrow \qquad \frac{dv}{dx} \frac{2}{\sqrt{1 + x^{2}}}$$
Hence
$$\frac{du}{dv} = \frac{\frac{du}{dx}}{\frac{dv}{dx}} = \frac{\frac{-1}{\sqrt{1 - x^{2}}}}{\frac{2}{\sqrt{1 - x^{2}}}} = \frac{-1}{2}.$$
