## Determinants

### Short Answer Type Questions

**Q. 1**  $\begin{vmatrix} x^2 - x + 1 & x - 1 \\ x + 1 & x + 1 \end{vmatrix}$

**Sol.** We have, 
$$\begin{vmatrix} x^2 - x + 1 & x - 1 \\ x + 1 & x + 1 \end{vmatrix} = \begin{vmatrix} x^2 - 2x + 2 & x - 1 \\ 0 & x + 1 \end{vmatrix}$$
  $[\because C_1 \rightarrow C_1 - C_2]$   

$$= (x^2 - 2x + 2) \cdot (x + 1) - (x - 1) \cdot 0$$
  

$$= x^3 - 2x^2 + 2x + x^2 - 2x + 2$$
  

$$= x^3 - x^2 + 2$$

**Q. 2**  $\begin{vmatrix} a+x & y & z \\ x & a+y & z \\ x & y & a+z \end{vmatrix}$

**Sol.** We have, 
$$\begin{vmatrix} a+x & y & z \\ x & a+y & z \\ x & y & a+z \end{vmatrix} = \begin{vmatrix} a & -a & 0 \\ 0 & a & -a \\ x & y & a+z \end{vmatrix}$$
  $[\because R_1 \rightarrow R_1 - R_2]$   

$$= \begin{vmatrix} a & 0 & 0 \\ 0 & a & -a \\ x & x+y & a+z \end{vmatrix}$$
  $[\text{and } R_2 \rightarrow R_2 - R_3]$   

$$= a(a^2 + az + ax + ay)$$
  

$$= a^2(a + z + x + y)$$
  $[\because C_2 \rightarrow C_2 + C_1]$

$$\text{Q. 3} \begin{vmatrix} 0 & xy^2 & xz^2 \\ x^2y & 0 & yz^2 \\ x^2z & zy^2 & 0 \end{vmatrix}$$

**Sol.** We have,

$$\begin{vmatrix} 0 & xy^2 & xz^2 \\ x^2y & 0 & yz^2 \\ x^2z & zy^2 & 0 \end{vmatrix} = x^2y^2z^2 \begin{vmatrix} 0 & x & x \\ y & 0 & y \\ z & z & 0 \end{vmatrix}$$

[taking  $x^2$ ,  $y^2$  and  $z^2$  common from  $C_1$ ,  $C_2$  and  $C_3$ , respectively]

$$\begin{aligned} &= x^2y^2z^2 \begin{vmatrix} 0 & 0 & x \\ y & -y & y \\ z & z & 0 \end{vmatrix} && [\because C_2 \rightarrow C_2 - C_3] \\ &= x^2y^2z^2 [x(yz + yz)] \\ &= x^2y^2z^2 \cdot 2xyz = 2x^3y^3z^3 \end{aligned}$$

$$\text{Q. 4} \begin{vmatrix} 3x & -x+y & -x+z \\ x-y & 3y & z-y \\ x-z & y-z & 3z \end{vmatrix}$$

$$\text{Sol. We have, } \begin{vmatrix} 3x & -x+y & -x+z \\ x-y & 3y & z-y \\ x-z & y-z & 3z \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ ,

$$\begin{aligned} &= \begin{vmatrix} x+y+z & -x+y & -x+z \\ x+y+z & 3y & z-y \\ x+y+z & y-z & 3z \end{vmatrix} \\ &= (x+y+z) \begin{vmatrix} 1 & -x+y & -x+z \\ 1 & 3y & z-y \\ 1 & y-z & 3z \end{vmatrix} && [\text{taking } (x+y+z) \text{ common from column } C_1] \end{aligned}$$

$$\begin{aligned} &= (x+y+z) \begin{vmatrix} 1 & -x+y & -x+z \\ 0 & 2y+x & x-y \\ 0 & x-z & 2z+x \end{vmatrix} \\ &\quad [\because R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1] \end{aligned}$$

Now, expanding along first column, we get

$$\begin{aligned} &(x+y+z) \cdot 1 [(2y+x)(2z+x) - (x-y)(x-z)] \\ &= (x+y+z)(4yz + 2yx + 2xz + x^2 - x^2 + xz + yx - yz) \\ &= (x+y+z)(3yz + 3yx + 3xz) \\ &= 3(x+y+z)(yz + yx + xz) \end{aligned}$$

$$\text{Q. 5} \begin{vmatrix} x+4 & x & x \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix}$$

$$\text{Sol. We have, } \begin{vmatrix} x+4 & x & x \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix} = \begin{vmatrix} 2x+4 & 2x+4 & 2x \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix} \quad [:: R_1 \rightarrow R_1 + R_2]$$

$$= \begin{vmatrix} 2x & 2x & 2x \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix} + \begin{vmatrix} 4 & 4 & 0 \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix}$$

[here, given determinant is expressed in sum of two determinants]

$$= 2x \begin{vmatrix} 1 & 1 & 1 \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix} + 4 \begin{vmatrix} 1 & 1 & 0 \\ x & x+4 & x \\ x & x & x+4 \end{vmatrix}$$

[taking  $2x$  common from first row of first determinant and 4 from first row of second determinant]

Applying  $C_1 \rightarrow C_1 - C_3$  and  $C_2 \rightarrow C_2 - C_3$  in first and applying  $C_1 \rightarrow C_1 - C_2$  in second, we get

$$= 2x \begin{vmatrix} 0 & 0 & 1 \\ 0 & 4 & x \\ -4 & -4 & x+4 \end{vmatrix} + 4 \begin{vmatrix} 0 & 1 & 0 \\ -4 & x+4 & x \\ 0 & x & x+4 \end{vmatrix}$$

Expanding both the along first column, we get

$$\begin{aligned} & 2x[-4(-4)] + 4[4(x+4-0)] \\ & = 2x \times 16 + 16(x+4) \\ & = 32x + 16x + 64 \\ & = 16(3x+4) \end{aligned}$$

$$\text{Q. 6} \begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

$$\text{Sol. We have, } \begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

$$= \begin{vmatrix} a+b+c & a+b+c & a+b+c \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} \quad [:: R_1 \rightarrow R_1 + R_2 + R_3]$$

$$= (a+b+c) \begin{vmatrix} 1 & 1 & 1 \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

[taking  $(a+b+c)$  common from the first row]

$$= (a+b+c) \begin{vmatrix} 0 & 0 & 1 \\ 0 & -(a+b+c) & 2b \\ (a+b+c) & (a+b+c) & (c-a-b) \end{vmatrix}$$

[::  $C_1 \rightarrow C_1 - C_3$  and  $C_2 \rightarrow C_2 - C_3$ ]

Expanding along  $R_1$ ,

$$\begin{aligned} &= (a + b + c) [1\{0 + (a + b + c)^2\}] \\ &= (a + b + c) [(a + b + c)^2] \\ &= (a + b + c)^3 \end{aligned}$$

**Q. 7**  $\begin{vmatrix} y^2z^2 & yz & y+z \\ z^2x^2 & zx & z+x \\ x^2y^2 & xy & x+y \end{vmatrix} = 0$

**Sol.** We have to prove,

$$\begin{aligned} &\begin{vmatrix} y^2z^2 & yz & y+z \\ z^2x^2 & zx & z+x \\ x^2y^2 & xy & x+y \end{vmatrix} = 0 \\ \therefore \text{LHS} &= \begin{vmatrix} y^2z^2 & yz & y+z \\ z^2x^2 & zx & z+x \\ x^2y^2 & xy & x+y \end{vmatrix} = \frac{1}{xyz} \begin{vmatrix} x^2y^2z^2 & xyz & xy+zx \\ x^2yz^2 & xyz & yz+xy \\ x^2y^2z & xyz & xz+yz \end{vmatrix} \\ &\quad [\because R_1 \rightarrow xR_1, R_2 \rightarrow yR_2, R_3 \rightarrow zR_3] \\ &= \frac{1}{xyz} (xyz)^2 \begin{vmatrix} yz & 1 & xy+zx \\ xz & 1 & yz+xy \\ xy & 1 & xz+yz \end{vmatrix} \\ &\quad [\text{taking } (xyz) \text{ common from } C_1 \text{ and } C_2] \\ &= xyz \begin{vmatrix} yz & 1 & xy+yz+zx \\ xz & 1 & xy+yz+zx \\ xy & 1 & xy+yz+zx \end{vmatrix} [\text{C}_3 \rightarrow C_3 + C_1] \\ &= xyz (xy+yz+zx) \begin{vmatrix} yz & 1 & 1 \\ xz & 1 & 1 \\ xy & 1 & 1 \end{vmatrix} \\ &\quad [\text{taking } (xy+yz+zx) \text{ common from } C_3] \\ &= 0 \quad [\text{since, } C_2 \text{ and } C_3 \text{ are identicals}] \\ &= \text{RHS} \quad \text{Hence proved.} \end{aligned}$$

**Q. 8**  $\begin{vmatrix} y+z & z & y \\ z & z+x & x \\ y & x & x+y \end{vmatrix} = 4xyz$

#### Thinking Process

First in LHS use  $C_1 \rightarrow C_1 + C_2 + C_3$  and then by using  $C_1 \rightarrow C_1 - C_2$  and  $R_1 \rightarrow R_1 - R_3$ , we can get two zeroes in column 1 and then by simplification we will get the desired result.

**Sol.** We have to prove,

$$\begin{vmatrix} y+z & z & y \\ z & z+x & x \\ y & x & x+y \end{vmatrix} = 4xyz$$

$$\begin{aligned}
 \therefore \text{LHS} &= \begin{vmatrix} y+z & z & y \\ z & z+x & x \\ y & x & x+y \end{vmatrix} \\
 &= \begin{vmatrix} y+z+z+y & z & y \\ z+z+x+x & z+x & x \\ y+x+x+y & x & x+y \end{vmatrix} \quad [C_1 \rightarrow C_1 + C_2 + C_3] \\
 &= 2 \begin{vmatrix} (y+z) & z & y \\ (z+x) & z+x & x \\ (x+y) & x & x+y \end{vmatrix} \quad [\text{taking } 2 \text{ common from } C_1] \\
 &= 2 \begin{vmatrix} y & z & y \\ 0 & z+x & x \\ y & x & x+y \end{vmatrix} \quad [C_1 \rightarrow C_1 - C_2] \\
 &= 2 \begin{vmatrix} 0 & z-x & -x \\ 0 & z+x & x \\ y & x & x+y \end{vmatrix} \quad [R_1 \rightarrow R_1 - R_3] \\
 &= 2 [y(xz - x^2 + xz + x^2)] \\
 &= 4xyz = \text{RHS}
 \end{aligned}$$

Hence proved.

$$\text{Q. 9} \quad \begin{vmatrix} a^2 + 2a & 2a+1 & 1 \\ 2a+1 & a+2 & 1 \\ 3 & 3 & 1 \end{vmatrix} = (a-1)^3$$

### Thinking Process

Here, by using  $R_1 \rightarrow R_1 - R_2$  and  $R_2 \rightarrow R_2 - R_3$  in LHS, we can easily get the desired result.

**Sol.** We have to prove,

$$\begin{aligned}
 &= \begin{vmatrix} a^2 + 2a & 2a+1 & 1 \\ 2a+1 & a+2 & 1 \\ 3 & 3 & 1 \end{vmatrix} = (a-1)^3 \\
 \therefore \text{LHS} &= \begin{vmatrix} a^2 + 2a & 2a+1 & 1 \\ 2a+1 & a+2 & 1 \\ 3 & 3 & 1 \end{vmatrix} \\
 &= \begin{vmatrix} a^2 + 2a - 2a - 1 & 2a + 1 - a - 2 & 0 \\ 2a + 1 - 3 & a + 2 - 3 & 0 \\ 3 & 3 & 1 \end{vmatrix} \quad [R_1 \rightarrow R_1 - R_2 \text{ and } R_2 \rightarrow R_2 - R_3] \\
 &= \begin{vmatrix} (a-1)(a+1) & (a-1) & 0 \\ 2(a-1) & (a-1) & 0 \\ 3 & 3 & 1 \end{vmatrix} = (a-1)^2 \begin{vmatrix} (a+1) & 1 & 0 \\ 2 & 1 & 0 \\ 3 & 3 & 1 \end{vmatrix} \\
 &\quad [\text{taking } (a-1) \text{ common from } R_1 \text{ and } R_2 \text{ each}] \\
 &= (a-1)^2[1(a+1)-2] = (a-1)^3 \\
 &= \text{RHS}
 \end{aligned}$$

Hence proved.

**Q. 10** If  $A + B + C = 0$ , then prove that  $\begin{vmatrix} 1 & \cos C & \cos B \\ \cos C & 1 & \cos A \\ \cos B & \cos A & 1 \end{vmatrix} = 0$ .

### Thinking Process

We have, given  $A + B + C = 0$ , so on solving the determinant by expansion, we can use  $\cos(A + B) = \cos(-C)$  and similarly after simplification this expansion we will get the desired result.

**Sol.** We have to prove,  $\begin{vmatrix} 1 & \cos C & \cos B \\ \cos C & 1 & \cos A \\ \cos B & \cos A & 1 \end{vmatrix} = 0$

$$\begin{aligned} \therefore \text{LHS} &= \begin{vmatrix} 1 & \cos C & \cos B \\ \cos C & 1 & \cos A \\ \cos B & \cos A & 1 \end{vmatrix} \\ &= 1(1 - \cos^2 A) - \cos C (\cos C - \cos A \cdot \cos B) + \cos B (\cos C \cdot \cos A - \cos B) \\ &= \sin^2 A - \cos^2 C + \cos A \cdot \cos B \cdot \cos C + \cos A \cdot \cos B \cdot \cos C - \cos^2 B \\ &= \sin^2 A - \cos^2 B + 2 \cos A \cdot \cos B \cdot \cos C - \cos^2 C \\ &= -\cos(A + B) \cdot \cos(A - B) + 2 \cos A \cdot \cos B \cdot \cos C - \cos^2 C \\ &\quad [\because \cos^2 B - \sin^2 A = \cos(A + B) \cdot \cos(A - B)] \\ &= -\cos(-C) \cdot \cos(A - B) + \cos C (2 \cos A \cdot \cos B - \cos C) \quad [\because \cos(-\theta) = \cos \theta] \\ &= -\cos C (\cos A \cdot \cos B + \sin A \cdot \sin B - 2 \cos A \cdot \cos B + \cos C) \\ &= \cos C (\cos A \cdot \cos B - \sin A \cdot \sin B - \cos C) \\ &= \cos C [\cos(A + B) - \cos C] \\ &= \cos C (\cos C - \cos C) = 0 = \text{RHS} \end{aligned}$$

Hence proved.

**Q. 11** If the coordinates of the vertices of an equilateral triangle with sides of length ' $a$ ' are  $(x_1, y_1), (x_2, y_2)$  and  $(x_3, y_3)$ , then

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2 = \frac{3a^4}{4}.$$

**Sol.** Since, we know that area of a triangle with vertices  $(x_1, y_1), (x_2, y_2)$  and  $(x_3, y_3)$ , is given by

$$\begin{aligned} \Delta &= \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \\ \Rightarrow \Delta^2 &= \frac{1}{4} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2 \quad \dots(i) \end{aligned}$$

We know that, area of an equilateral triangle with side  $a$ ,

$$\begin{aligned} \Delta &= \frac{1}{2} \left( \frac{\sqrt{3}}{2} \right) a^2 = \frac{\sqrt{3}}{4} a^2 \\ \Rightarrow \Delta^2 &= \frac{3}{16} a^4 \quad \dots(ii) \end{aligned}$$

From Eqs. (i) and (ii),  $\frac{3}{16} a^4 = \frac{1}{4} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2$

$$\Rightarrow \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2 = \frac{3}{4} a^4 \quad \text{Hence proved.}$$

**Q. 12** Find the value of  $\theta$  satisfying  $\begin{bmatrix} 1 & 1 & \sin 3\theta \\ -4 & 3 & \cos 2\theta \\ 7 & -7 & -2 \end{bmatrix} = 0$

**Sol.** We have,

$$\begin{vmatrix} 1 & 1 & \sin 3\theta \\ -4 & 3 & \cos 2\theta \\ 7 & -7 & -2 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 0 & 1 & \sin 3\theta \\ -7 & 3 & \cos 2\theta \\ 14 & -7 & -2 \end{vmatrix} = 0 \quad [:\ C_1 \rightarrow C_1 - C_2]$$

$$\Rightarrow \begin{vmatrix} 0 & 1 & \sin 3\theta \\ -1 & 3 & \cos 2\theta \\ 2 & -7 & -2 \end{vmatrix} = 0 \quad [\text{taking 7 common from } C_1]$$

$$\Rightarrow 7 [0 - 1(2 - 2\cos 2\theta) + \sin 3\theta(7 - 6)] = 0 \quad [\text{expanding along } R_1]$$

$$\Rightarrow 7 [-2(1 - \cos 2\theta) + \sin 3\theta] = 0$$

$$\Rightarrow -14 + 14\cos 2\theta + 7\sin 3\theta = 0$$

$$\Rightarrow 14\cos 2\theta + 7\sin 3\theta = 14$$

$$\Rightarrow 14(1 - 2\sin^2 \theta) + 7(3\sin \theta - 4\sin^3 \theta) = 14$$

$$\Rightarrow -28\sin^2 \theta + 14 + 21\sin \theta - 28\sin^3 \theta = 14$$

$$\Rightarrow -28\sin^2 \theta - 28\sin^3 \theta + 21\sin \theta = 0$$

$$\Rightarrow 28\sin^3 \theta + 28\sin^2 \theta - 21\sin \theta = 0$$

$$\Rightarrow 4\sin^3 \theta + 4\sin^2 \theta - 3\sin \theta = 0$$

$$\Rightarrow \sin \theta (4\sin^2 \theta + 4\sin \theta - 3) = 0$$

$$\Rightarrow \text{Either } \sin \theta = 0,$$

$$\Rightarrow \theta = n\pi \quad \text{or} \quad 4\sin^2 \theta + 4\sin \theta - 3 = 0$$

$$\therefore \sin \theta = \frac{-4 \pm \sqrt{16 + 48}}{8} = \frac{-4 \pm \sqrt{64}}{8}$$

$$= \frac{-4 \pm 8}{8} = \frac{4}{8}, \frac{-12}{8}$$

$$\sin \theta = \frac{1}{2}, \frac{-3}{2}$$

If  $\sin \theta = \frac{1}{2} = \sin \frac{\pi}{6}$ , then

$$\theta = n\pi + (-1)^n \frac{\pi}{6}$$

Hence,  $\sin \theta = \frac{-3}{2}$  [not possible because  $-1 \leq \sin \theta \leq 1$ ]

**Q. 13** If  $\begin{vmatrix} 4-x & 4+x & 4+x \\ 4+x & 4-x & 4+x \\ 4+x & 4+x & 4-x \end{vmatrix} = 0$ , then find the value of  $x$ .

**Sol.** Given,

$$\begin{aligned} & \begin{vmatrix} 4-x & 4+x & 4+x \\ 4+x & 4-x & 4+x \\ 4+x & 4+x & 4-x \end{vmatrix} = 0 \\ \Rightarrow & \begin{vmatrix} 12+x & 12+x & 12+x \\ 4+x & 4-x & 4+x \\ 4+x & 4+x & 4-x \end{vmatrix} = 0 \quad [\because R_1 \rightarrow R_1 + R_2 + R_3] \\ \Rightarrow & (12+x) \begin{vmatrix} 1 & 1 & 1 \\ 4+x & 4-x & 4+x \\ 4+x & 4+x & 4-x \end{vmatrix} = 0 \quad [\text{taking } (12+x) \text{ common from } R_1] \\ \Rightarrow & (12+x) \begin{vmatrix} 0 & 0 & 1 \\ 0 & 8 & 4+x \\ 2x & 8 & 4-x \end{vmatrix} = 0 \quad [\because C_1 \rightarrow C_1 - C_3 \text{ and } C_2 \rightarrow C_2 + C_3] \\ \Rightarrow & (12+x)[1 \cdot (-16x)] = 0 \\ \Rightarrow & (12+x)(-16x) = 0 \\ \therefore & x = -12, 0 \end{aligned}$$

**Q. 14** If  $a_1, a_2, a_3, \dots, a_r$  are in GP, then prove that the determinant

$$\begin{vmatrix} a_{r+1} & a_{r+5} & a_{r+9} \\ a_{r+7} & a_{r+11} & a_{r+15} \\ a_{r+11} & a_{r+17} & a_{r+21} \end{vmatrix}$$

is independent of  $r$ .

#### Thinking Process

We know that,  $n$ th term of a GP has value  $ar^{n-1}$ , where  $a$  = first term and  $r$  = common ratio. So, by using this result, we can prove the given determinant as independent of  $r$ .

**Sol.** We know that,  $a_{r+1} = AR^{(r+1)-1} = AR^r$

where  $r = r$ th term of a GP,  $A$  = First term of a GP and  $R$  = Common ratio of GP

$$\begin{aligned} \text{We have,} & \begin{vmatrix} a_{r+1} & a_{r+5} & a_{r+9} \\ a_{r+7} & a_{r+11} & a_{r+15} \\ a_{r+11} & a_{r+17} & a_{r+21} \end{vmatrix} \\ & = \begin{vmatrix} AR^r & AR^{r+4} & AR^{r+8} \\ AR^{r+6} & AR^{r+10} & AR^{r+14} \\ AR^{r+10} & AR^{r+16} & AR^{r+20} \end{vmatrix} \\ & = AR^r \cdot AR^{r+6} \cdot AR^{r+10} \begin{vmatrix} 1 & AR^4 & AR^8 \\ 1 & AR^4 & AR^8 \\ 1 & AR^6 & AR^{10} \end{vmatrix} \end{aligned}$$

[taking  $AR^r$ ,  $AR^{r+6}$  and  $AR^{r+10}$  common from  $R_1$ ,  $R_2$  and  $R_3$ , respectively]

$= 0$  [since,  $R_1$  and  $R_2$  are identicals]

**Q. 15** Show that the points  $(a + 5, a - 4)$ ,  $(a - 2, a + 3)$  and  $(a, a)$  do not lie on a straight line for any value of  $a$ .

### Thinking Process

We know that, if three points lie in a straight line, then area formed by these points will be equal to zero. So, by showing area formed by these points other than zero, we can prove the result.

**Sol.** Given, the points are  $(a + 5, a - 4)$ ,  $(a - 2, a + 3)$  and  $(a, a)$ .

$$\begin{aligned}\therefore \Delta &= \frac{1}{2} \begin{vmatrix} a+5 & a-4 & 1 \\ a-2 & a+3 & 1 \\ a & a & 1 \end{vmatrix} \\ &= \frac{1}{2} \begin{vmatrix} 5 & -4 & 0 \\ -2 & 3 & 0 \\ a & a & 1 \end{vmatrix} \quad [:: R_1 \rightarrow R_1 - R_3 \text{ and } R_2 \rightarrow R_2 - R_3] \\ &= \frac{1}{2} [1(15 - 8)] \\ \Rightarrow \Delta &= \frac{7}{2} \neq 0\end{aligned}$$

Hence, given points form a triangle i.e., points do not lie in a straight line.

**Q. 16** Show that  $\triangle ABC$  is an isosceles triangle, if the determinant

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 + \cos A & 1 + \cos B & 1 + \cos C \\ \cos^2 A + \cos A & \cos^2 B + \cos B & \cos^2 C + \cos C \end{vmatrix} = 0.$$

$$\begin{aligned}\text{Sol. We have, } \Delta &= \begin{vmatrix} 1 & 1 & 1 \\ 1 + \cos A & 1 + \cos B & 1 + \cos C \\ \cos^2 A + \cos A & \cos^2 B + \cos B & \cos^2 C + \cos C \end{vmatrix} = 0 \\ \Delta &= \begin{vmatrix} 0 & 0 & 1 \\ \cos A - \cos C & \cos B - \cos C & 1 + \cos C \\ \cos^2 A + \cos A - \cos^2 C - \cos C & \cos^2 B + \cos B - \cos^2 C - \cos C & \cos^2 C + \cos C \end{vmatrix} = 0 \quad [:: C_1 \rightarrow C_1 - C_3 \text{ and } C_2 \rightarrow C_2 - C_3]\end{aligned}$$

$$\Rightarrow (\cos A - \cos C) \cdot (\cos B - \cos C)$$

$$\begin{vmatrix} 0 & 0 & 1 \\ 1 & 1 & 1 + \cos C \\ \cos A + \cos C + 1 & \cos B + \cos C + 1 & \cos^2 C + \cos C \end{vmatrix} = 0$$

[taking  $(\cos A - \cos C)$  common from  $C_1$  and  $(\cos B - \cos C)$  common from  $C_2$ ]

$$\Rightarrow (\cos A - \cos C) \cdot (\cos B - \cos C) [(\cos B + \cos C + 1) - (\cos A + \cos C + 1)] = 0$$

$$\Rightarrow (\cos A - \cos C) \cdot (\cos B - \cos C) (\cos B + \cos C + 1 - \cos A - \cos C - 1) = 0$$

$$\Rightarrow (\cos A - \cos C) \cdot (\cos B - \cos C) (\cos B - \cos A) = 0$$

$$\text{i.e., } \cos A = \cos C \text{ or } \cos B = \cos C \text{ or } \cos B = \cos A$$

$$\Rightarrow A = C \text{ or } B = C \text{ or } B = A$$

Hence,  $ABC$  is an isosceles triangle.

**Q. 17** Find  $A^{-1}$ , if  $A = \begin{vmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{vmatrix}$  and show that  $A^{-1} = \frac{A^2 - 3I}{2}$ .

**Sol.** We have,  $A = \begin{vmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{vmatrix}$

$$\therefore A_{11} = -1, A_{12} = 1, A_{13} = 1, A_{21} = 1, A_{22} = -1, A_{23} = 1, A_{31} = 1, A_{32} = 1 \text{ and } A_{33} = -1$$

$$\therefore \text{adj } A = \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix}^T = \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix}$$

and

$$|A| = -1(-1) + 1 \cdot 1 = 2$$

$$\therefore A^{-1} = \frac{\text{adj } A}{|A|} = \frac{1}{2} \begin{bmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{bmatrix} \quad \dots(i)$$

and

$$A^2 = \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix} \quad \dots(ii)$$

$$\therefore \frac{A^2 - 3I}{2} = \frac{1}{2} \left\{ \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix} - \begin{bmatrix} 3 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 3 \end{bmatrix} \right\} = \frac{1}{2} \begin{bmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{bmatrix}$$

$$= A^{-1}$$

[using Eq. (i)]  
Hence proved.

## Long Answer Type Questions

**Q. 18** If  $A = \begin{vmatrix} 1 & 2 & 0 \\ -2 & -1 & -2 \\ 0 & -1 & 1 \end{vmatrix}$ , then find the value of  $A^{-1}$ .

Using  $A^{-1}$ , solve the system of linear equations  $x - 2y = 10$ ,  $2x - y - z = 8$  and  $-2y + z = 7$ .

**Sol.** We have,  $A = \begin{vmatrix} 1 & 2 & 0 \\ -2 & -1 & -2 \\ 0 & -1 & 1 \end{vmatrix}$  ... (i)

$$\therefore |A| = 1(-3) - 2(-2) + 0 = 1 \neq 0$$

Now,  $A_{11} = -3, A_{12} = 2, A_{13} = 2, A_{21} = -2, A_{22} = 1, A_{23} = 1, A_{31} = -4, A_{32} = 2$  and  $A_{33} = 3$

$$\therefore \text{adj } (A) = \begin{vmatrix} -3 & 2 & 2 \\ -2 & 1 & 1 \\ -4 & 2 & 3 \end{vmatrix}^T = \begin{vmatrix} -3 & -2 & -4 \\ 2 & 1 & 2 \\ 2 & 1 & 3 \end{vmatrix}$$

$$\therefore A^{-1} = \frac{\text{adj } A}{|A|}$$

$$= \frac{1}{1} \begin{vmatrix} -3 & -2 & -4 \\ 2 & 1 & 2 \\ 2 & 1 & 3 \end{vmatrix}$$

$$\Rightarrow A^{-1} = \begin{vmatrix} -3 & -2 & -4 \\ 2 & 1 & 2 \\ 2 & 1 & 3 \end{vmatrix} \quad \dots(\text{ii})$$

Also, we have the system of linear equations as

$$x - 2y = 10,$$

$$2x - y - z = 8$$

and

$$-2y + z = 7$$

In the form of  $CX = D$ ,

$$\begin{bmatrix} 1 & 2 & 0 \\ 2 & -1 & -1 \\ 0 & -2 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 10 \\ 8 \\ 7 \end{bmatrix}$$

where,

$$C = \begin{bmatrix} 1 & -2 & 0 \\ 2 & -1 & -1 \\ 0 & -2 & 1 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } D = \begin{bmatrix} 10 \\ 8 \\ 7 \end{bmatrix}$$

We know that,

$$(A^T)^{-1} = (A^{-1})^T$$

$$\therefore C^T = \begin{bmatrix} 1 & 2 & 0 \\ -2 & -1 & -2 \\ 0 & -1 & 1 \end{bmatrix} = A \quad [\text{using Eq. (i)}]$$

$\therefore$

$$X = C^{-1} D$$

$$\Rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -3 & 2 & 2 \\ -2 & 1 & 1 \\ -4 & 2 & 3 \end{bmatrix} \begin{bmatrix} 10 \\ 8 \\ 7 \end{bmatrix}$$

$$= \begin{bmatrix} -30 + 16 + 14 \\ -20 + 8 + 7 \\ -40 + 16 + 21 \end{bmatrix} = \begin{bmatrix} 0 \\ -5 \\ -3 \end{bmatrix}$$

$\therefore$

$$x = 0, y = -5 \text{ and } z = -3$$

**Q. 19** Using matrix method, solve the system of equations  $3x + 2y - 2z = 3$ ,  
 $x + 2y + 3z = 6$  and  $2x - y + z = 2$ .

#### Thinking Process

We know that, for given system of equations in the matrix form, we get  $AX = B \Rightarrow X = A^{-1}B$ ,

where  $A^{-1} = \frac{\text{adj}(A)}{|A|}$  and then by getting inverse of A and determinant of A, we can get

the desired result.

**Sol.** Given system of equations is

$$3x + 2y - 2z = 3$$

$$x + 2y + 3z = 6$$

and

$$2x - y + z = 2$$

In the form of  $AX = B$ ,

$$\begin{bmatrix} 3 & 2 & -2 \\ 1 & 2 & 3 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 6 \\ 2 \end{bmatrix}$$

For  $A^{-1}$ ,

$$|A| = |3(5) - 2(1-6) + (-2)(-5)| \\ = |15 + 10 + 10| = |35| \neq 0$$

$\therefore A_{11} = 5, A_{12} = 5, A_{13} = -5, A_{21} = 0, A_{22} = 7, A_{23} = 7, A_{31} = 10, A_{32} = -11$  and  $A_{33} = 4$

$$\therefore \text{adj } A = \begin{vmatrix} 5 & 5 & -5 \\ 0 & 7 & 7 \\ 10 & -11 & 4 \end{vmatrix}^T = \begin{vmatrix} 5 & 0 & 10 \\ 5 & 7 & -11 \\ -5 & 7 & 4 \end{vmatrix}$$

$$\text{Now, } A^{-1} = \frac{\text{adj } A}{|A|} = \frac{1}{35} \begin{vmatrix} 5 & 0 & 10 \\ 5 & 7 & -11 \\ -5 & 7 & 4 \end{vmatrix}$$

For  $X = A^{-1}B$ ,

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{35} \begin{bmatrix} 5 & 0 & 10 \\ 5 & 7 & -11 \\ -5 & 7 & 4 \end{bmatrix} \begin{bmatrix} 3 \\ 6 \\ 2 \end{bmatrix} \\ = \frac{1}{35} \begin{bmatrix} 15 + 20 \\ 15 + 42 - 22 \\ -15 + 42 + 8 \end{bmatrix} = \frac{1}{35} \begin{bmatrix} 35 \\ 35 \\ 35 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

$\therefore x = 1, y = 1$  and  $z = 1$

**Q. 20** If  $A = \begin{vmatrix} 2 & 2 & -4 \\ -4 & 2 & -4 \\ 2 & -1 & 5 \end{vmatrix}$  and  $B = \begin{vmatrix} 1 & -1 & 0 \\ 2 & 3 & 4 \\ 0 & 1 & 2 \end{vmatrix}$ , then find  $BA$  and use this to solve the system of equations  $y + 2z = 7$ ,  $x - y = 3$  and  $2x + 3y + 4z = 17$ .

**Sol.** We have,

$$A = \begin{vmatrix} 2 & 2 & -4 \\ -4 & 2 & -4 \\ 2 & -1 & 5 \end{vmatrix} \text{ and } B = \begin{vmatrix} 1 & -1 & 0 \\ 2 & 3 & 4 \\ 0 & 1 & 2 \end{vmatrix}$$

$$\therefore BA = \begin{vmatrix} 1 & -1 & 0 \\ 2 & 3 & 4 \\ 0 & 1 & 2 \end{vmatrix} \begin{vmatrix} 2 & 2 & -4 \\ -4 & 2 & -4 \\ 2 & -1 & 5 \end{vmatrix} = \begin{vmatrix} 6 & 0 & 0 \\ 0 & 6 & 0 \\ 0 & 0 & 6 \end{vmatrix} = 6I$$

$$\therefore B^{-1} = \frac{A}{6} = \frac{1}{6} A = \frac{1}{6} \begin{vmatrix} 2 & 2 & -4 \\ -4 & 2 & -4 \\ 2 & -1 & 5 \end{vmatrix} \quad \dots(i)$$

Also,

$$x - y = 3, 2x + 3y + 4z = 17 \text{ and } y + 2z = 7$$

$$\Rightarrow \begin{bmatrix} 1 & -1 & 0 \\ 2 & 3 & 4 \\ 0 & 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 17 \\ 7 \end{bmatrix}$$

$$\therefore \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ 2 & 3 & 4 \\ 0 & 1 & 2 \end{bmatrix}^{-1} \begin{bmatrix} 3 \\ 17 \\ 7 \end{bmatrix}$$

$$= \frac{1}{6} \begin{bmatrix} 2 & 2 & -4 \\ -4 & 2 & -4 \\ 2 & -1 & 5 \end{bmatrix} \begin{bmatrix} 3 \\ 17 \\ 7 \end{bmatrix}$$

$$= \frac{1}{6} \begin{bmatrix} 6 + 34 - 28 \\ -12 + 34 - 28 \\ 6 - 17 + 35 \end{bmatrix} = \frac{1}{6} \begin{bmatrix} 12 \\ -6 \\ 24 \end{bmatrix} = \begin{bmatrix} 2 \\ -1 \\ 4 \end{bmatrix}$$

[using Eq. (i)]

$$\therefore x = 2, y = -1 \text{ and } z = 4$$

**Q. 21** If  $a + b + c \neq 0$  and  $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 0$ , then prove that  $a = b = c$ .

**Sol.** Let

$$A = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$

$$= \begin{vmatrix} a + b + c & a + b + c & a + b + c \\ b & c & a \\ c & a & b \end{vmatrix}$$

[ $\because R_1 \rightarrow R_1 + R_2 + R_3$ ]

$$= (a + b + c) \begin{vmatrix} 1 & 1 & 1 \\ b & c & a \\ c & a & b \end{vmatrix}$$

$$= (a + b + c) \begin{vmatrix} 0 & 0 & 1 \\ b - a & c - a & a \\ c - b & a - b & b \end{vmatrix}$$

[ $\because C_1 \rightarrow C_1 - C_3$  and  $C_2 \rightarrow C_2 - C_3$ ]

Expanding along  $R_1$ ,

$$\begin{aligned} &= (a + b + c) [1(b - a)(a - b) - (c - a)(c - b)] \\ &= (a + b + c)(ba - b^2 - a^2 + ab - c^2 + cb + ac - ab) \\ &= \frac{-1}{2}(a + b + c) \times (-2)(-a^2 - b^2 - c^2 + ab + bc + ca) \\ &= \frac{-1}{2}(a + b + c)[a^2 + b^2 + c^2 - 2ab - 2bc - 2ca + a^2 + b^2 + c^2] \\ &= -\frac{1}{2}(a + b + c)[a^2 + b^2 - 2ab + b^2 + c^2 - 2bc + c^2 + a^2 - 2ac] \\ &= \frac{-1}{2}(a + b + c)[(a - b)^2 + (b - c)^2 + (c - a)^2] \end{aligned}$$

Also,

$$\begin{aligned} A &= 0 \\ &= \frac{-1}{2}(a + b + c)[(a - b)^2 + (b - c)^2 + (c - a)^2] = 0 \\ &\quad (a - b)^2 + (b - c)^2 + (c - a)^2 = 0 \quad [\because a + b + c \neq 0, \text{ given}] \\ \Rightarrow &\quad a - b = b - c = c - a = 0 \\ &\quad a = b = c \end{aligned}$$

Hence proved.

**Q. 22** Prove that  $\begin{vmatrix} bc - a^2 & ca - b^2 & ab - c^2 \\ ca - b^2 & ab - c^2 & bc - a^2 \\ ab - c^2 & bc - a^2 & ca - b^2 \end{vmatrix}$  is divisible by  $(a + b + c)$  and find the quotient.

**Sol.** Let  $\Delta = \begin{vmatrix} bc - a^2 & ca - b^2 & ab - c^2 \\ ca - b^2 & ab - c^2 & bc - a^2 \\ ab - c^2 & bc - a^2 & ca - b^2 \end{vmatrix}$

$$= \begin{vmatrix} bc - a^2 - ca + b^2 & ca - b^2 - ab + c^2 & ab - c^2 \\ ca - b^2 - ab + c^2 & ab - c^2 - bc + a^2 & bc - a^2 \\ ab - c^2 - bc + a^2 & bc - a^2 - ca + b^2 & ca - b^2 \end{vmatrix}$$

[ $\because C_1 \rightarrow C_1 - C_2$  and  $C_2 \rightarrow C_2 - C_3$ ]

$$= \begin{vmatrix} (b-a)(a+b+c) & (c-b)(a+b+c) & ab - c^2 \\ (c-b)(a+b+c) & (a-c)(a+b+c) & bc - a^2 \\ (a-c)(a+b+c) & (b-a)(a+b+c) & ca - b^2 \end{vmatrix}$$

$$= (a+b+c)^2 \begin{vmatrix} b-a & c-b & ab - c^2 \\ c-b & a-c & bc - a^2 \\ a-c & b-a & ca - b^2 \end{vmatrix}$$

[taking  $(a+b+c)$  common from  $C_1$  and  $C_2$  each]

$$= (a+b+c)^2 \begin{vmatrix} 0 & 0 & ab + bc + ca - (a^2 + b^2 + c^2) \\ c-b & a-c & bc - a^2 \\ a-c & b-a & ca - b^2 \end{vmatrix}$$

[ $\because R_1 \rightarrow R_1 + R_2 + R_3$ ]

Now, expanding along  $R_1$ ,

$$\begin{aligned} &= (a+b+c)^2 [ab + bc + ca - (a^2 + b^2 + c^2)](c-b)(b-a) - (a-c)^2] \\ &= (a+b+c)^2 (ab + bc + ca - a^2 - b^2 - c^2) \\ &\quad (cb - ac - b^2 + ab - a^2 - c^2 + 2ac) \\ &= (a+b+c)^2 (a^2 + b^2 + c^2 - ab - bc - ca) \\ &\quad (a^2 + b^2 + c^2 - ac - ab - bc) \\ &= \frac{1}{2} (a+b+c) [(a+b+c)(a^2 + b^2 + c^2 - ab - bc - ca)] \\ &\quad [(a-b)^2 + (b-c)^2 + (c-a)^2] \\ &= \frac{1}{2} (a+b+c) (a^3 + b^3 + c^3 - 3abc) [(a-b)^2 + (b-c)^2 + (c-a)^2] \end{aligned}$$

Hence, given determinant is divisible by  $(a + b + c)$  and quotient is

$$(a^3 + b^3 + c^3 - 3abc)[(a-b)^2 + (b-c)^2 + (c-a)^2].$$

**Q. 23** If  $x + y + z = 0$ , then prove that  $\begin{vmatrix} xa & yb & zc \\ yc & za & xb \\ zb & xc & ya \end{vmatrix} = xyz \begin{vmatrix} a & b & c \\ c & a & b \\ b & c & a \end{vmatrix}$ .

### 💡 Thinking Process

We have, given  $x + y + z = 0 \Rightarrow x^3 + y^3 + z^3 = 3xyz$ . So, by using this in solving the given determinant from both the sides, we can equate the obtained result from both the sides to desired result.

**Sol.** Since,  $x + y + z = 0$ , also we have to prove

$$\begin{aligned} & \begin{vmatrix} xa & yb & zc \\ yc & za & xb \\ zb & xc & ya \end{vmatrix} = xyz \begin{vmatrix} a & b & c \\ c & a & b \\ b & c & a \end{vmatrix} \\ \therefore \quad & \text{LHS} = \begin{vmatrix} xa & yb & zc \\ yc & za & xb \\ zb & xc & ya \end{vmatrix} \\ &= xa(za \cdot ya - xb \cdot xc) - yb(yc \cdot ya - xb \cdot zb) + zc(yc \cdot xc - za \cdot zb) \\ &= xa(a^2yz - x^2bc) - yb(y^2ac - b^2xz) + zc(c^2xy - z^2ab) \\ &= xyza^3 - x^3abc - y^3abc + b^3xyz + c^3xyz - z^3abc \\ &= xyz(a^3 + b^3 + c^3) - abc(x^3 + y^3 + z^3) \\ &= xyz(a^3 + b^3 + c^3) - abc(3xyz) \\ &\quad [\because x + y + z = 0 \Rightarrow x^3 + y^3 + z^3 = 3xyz] \\ &= xyz(a^3 + b^3 + c^3 - 3abc) \quad \dots(i) \end{aligned}$$

Now,  $\text{RHS} = xyz \begin{vmatrix} a & b & c \\ c & a & b \\ b & c & a \end{vmatrix} = xyz \begin{vmatrix} a+b+c & b & c \\ a+b+c & a & b \\ a+b+c & c & a \end{vmatrix} \quad [\because C_1 \rightarrow C_1 + C_2 + C_3]$

$$\begin{aligned} &= xyz(a+b+c) \begin{vmatrix} 1 & b & c \\ 1 & a & b \\ 1 & c & a \end{vmatrix} \quad [\text{taking } (a+b+c) \text{ common from } C_1] \\ &= xyz(a+b+c) \begin{vmatrix} 0 & b-c & c-a \\ 0 & a-c & b-a \\ 1 & c & a \end{vmatrix} \\ &\quad [\because R_1 \rightarrow R_1 - R_3 \text{ and } R_2 \rightarrow R_2 - R_3] \end{aligned}$$

Expanding along  $C_1$ ,

$$\begin{aligned} &= xyz(a+b+c)[1(b-c)(b-a) - (a-c)(c-a)] \\ &= xyz(a+b+c)(b^2 - ab - bc + ac + a^2 + c^2 - 2ac) \\ &= xyz(a+b+c)(a^2 + b^2 + c^2 - ab - bc - ca) \\ &= xyz(a^3 + b^3 + c^3 - 3abc) \quad \dots(ii) \end{aligned}$$

From Eqs. (i) and (ii),

$$\begin{aligned} & \text{LHS} = \text{RHS} \\ \Rightarrow \quad & \begin{vmatrix} xa & yb & zc \\ yc & za & xb \\ zb & xc & ya \end{vmatrix} = xyz \begin{vmatrix} a & b & c \\ c & a & b \\ b & c & a \end{vmatrix} \quad \text{Hence proved.} \end{aligned}$$

## Objective Type Questions

**Q. 24** If  $\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$ , then the value of  $x$  is

(a) 3

(b)  $\pm 3$

(c)  $\pm 6$

(d) 6

**Sol. (c)**  $\because \begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$

$$\Rightarrow 2x^2 - 40 = 18 + 14$$

$$\Rightarrow 2x^2 = 32 + 40$$

$$\Rightarrow x^2 = \frac{72}{2} = 36$$

$$\therefore x = \pm 6$$

**Q. 25** The value of  $\begin{vmatrix} a-b & b+c & a \\ b-a & c+a & b \\ c-a & a+b & c \end{vmatrix}$  is

(a)  $a^3 + b^3 + c^3$

(b)  $3bc$

(c)  $a^3 + b^3 + c^3 - 3abc$

(d) None of these

**Sol. (d)** We have,

$$\begin{vmatrix} a-b & b+c & a \\ b-a & c+a & b \\ c-a & a+b & c \end{vmatrix} = \begin{vmatrix} a+c & b+c+a & a \\ b+c & c+a+b & b \\ c+b & a+b+c & c \end{vmatrix} \quad [:\text{C}_1 \rightarrow C_1 + C_2 \text{ and } C_2 \rightarrow C_2 + C_3]$$

$$= (a+b+c) \begin{vmatrix} a+c & 1 & a \\ b+c & 1 & b \\ c+b & 1 & c \end{vmatrix} \quad [\text{taking } (a+b+c) \text{ common from } C_2]$$

$$= (a+b+c) \begin{vmatrix} a-b & 0 & a-c \\ 0 & 0 & b-c \\ c+b & 1 & c \end{vmatrix} \quad [:\text{R}_2 \rightarrow R_2 - R_3 \text{ and } R_1 \rightarrow R_1 - R_3]$$

$$= (a+b+c) [-(b-c)(a-b)] \quad [\text{expanding along } R_2]$$

$$= (a+b+c)(c-b)(a-b)$$

**Q. 26** If the area of a triangle with vertices  $(-3, 0)$ ,  $(3, 0)$  and  $(0, k)$  is 9 sq units. Then, the value of  $k$  will be

(a) 9

(b) 3

(c) -9

(d) 6

**Sol. (b)** We know that, area of a triangle with vertices  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$  is given by

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$\therefore \Delta = \frac{1}{2} \begin{vmatrix} -3 & 0 & 1 \\ 3 & 0 & 1 \\ 0 & k & 1 \end{vmatrix}$$

Expanding along  $R_1$ ,

$$\begin{aligned} 9 &= \frac{1}{2} [-3(-k) - 0 + 1(3k)] \\ \Rightarrow 18 &= 3k + 3k = 6k \\ \therefore k &= \frac{18}{6} = 3 \end{aligned}$$

**Q. 27** The determinant

$$\begin{vmatrix} b^2 - ab & b - c & bc - ac \\ ab - a^2 & a - b & b^2 - ab \\ bc - ac & c - a & ab - a^2 \end{vmatrix} \text{ equals to}$$

- (a)  $abc(b - c)(c - a)(a - b)$       (b)  $(b - c)(c - a)(a - b)$   
 (c)  $(a + b + c)(b - c)(c - a)(a - b)$       (d) None of these

**Sol. (d)** We have,

$$\begin{aligned} \begin{vmatrix} b^2 - ab & b - c & bc - ac \\ ab - a^2 & a - b & b^2 - ab \\ bc - ac & c - a & ab - a^2 \end{vmatrix} &= \begin{vmatrix} b(b - a) & b - c & c(b - a) \\ a(b - a) & a - b & b(b - a) \\ c(b - a) & c - a & a(b - a) \end{vmatrix} \\ &= (b - a)^2 \begin{vmatrix} b & b - c & c \\ a & a - b & b \\ c & c - a & a \end{vmatrix} \\ &\quad [\text{on taking } (b - a) \text{ common from } C_1 \text{ and } C_3 \text{ each}] \\ &= (b - a)^2 \begin{vmatrix} b - c & b - c & c \\ a - b & a - b & b \\ c - a & c - a & a \end{vmatrix} \quad [C_1 \rightarrow C_1 - C_3] \\ &= 0 \end{aligned}$$

[since, two columns  $C_1$  and  $C_2$  are identical, so the value of determinant is zero]

**Q. 28** The number of distinct real roots of  $\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$  in the

interval  $-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$  is

- (a) 0      (b) 2      (c) 1      (d) 3

**Sol. (c)** We have,

$$\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$$

Applying  $C_1 \rightarrow C_1 + C_2 + C_3$ ,

$$\begin{vmatrix} 2\cos x + \sin x & \cos x & \cos x \\ 2\cos x + \sin x & \sin x & \cos x \\ 2\cos x + \sin x & \cos x & \sin x \end{vmatrix} = 0$$

On taking  $(2\cos x + \sin x)$  common from  $C_1$ , we get

$$\Rightarrow (2\cos x + \sin x) \begin{vmatrix} 1 & \cos x & \cos x \\ 1 & \sin x & \cos x \\ 1 & \cos x & \sin x \end{vmatrix} = 0$$

$$\Rightarrow (2\cos x + \sin x) \begin{vmatrix} 1 & \cos x & \cos x \\ 0 & \sin x - \cos x & 0 \\ 0 & 0 & (\sin x - \cos x) \end{vmatrix} = 0$$

$[\because R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1]$

Expanding along  $C_1$ ,

$$(2\cos x + \sin x)[1 \cdot (\sin x - \cos x)^2] = 0$$

$$\Rightarrow (2\cos x + \sin x)(\sin x - \cos x)^2 = 0$$

$$\text{Either } 2\cos x = -\sin x$$

$$\Rightarrow \cos x = -\frac{1}{2}\sin x$$

$$\Rightarrow \tan x = -2$$

... (i)

But here for  $-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$ , we get  $-1 \leq \tan x \leq 1$  so, no solution possible

$$\text{and for } (\sin x - \cos x)^2 = 0, \sin x = \cos x$$

$$\Rightarrow \tan x = 1 = \tan \frac{\pi}{4}$$

$$\therefore x = \frac{\pi}{4}$$

So, only one distinct real root exist.

**Q. 29** If  $A$ ,  $B$  and  $C$  are angles of a triangle, then the determinant

$$\begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix} \text{ is equal to}$$

(a) 0

(b) -1

(c) 1

(d) None of these

**Sol.** (a) We have,  $\begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$

Applying  $C_1 \rightarrow aC_1 + bC_2 + cC_3$ ,

$$\begin{vmatrix} -a + b\cos C + c\cos B & \cos C & \cos B \\ a\cos C - b + c\cos A & -1 & \cos A \\ a\cos B + b\cos A - c & \cos A & -1 \end{vmatrix}$$

Also, by projection rule in a triangle, we know that

$$a = b\cos C + c\cos B, b = c\cos A + a\cos C \text{ and } c = a\cos B + b\cos A$$

Using above equation in column first, we get

$$\begin{vmatrix} -a + a & \cos C & \cos B \\ b - b & -1 & \cos A \\ c - c & \cos A & -1 \end{vmatrix} = \begin{vmatrix} 0 & \cos C & \cos B \\ 0 & -1 & \cos A \\ 0 & \cos A & -1 \end{vmatrix} = 0$$

[since, determinant having all elements of any column or row gives value of determinant as zero]

**Q. 30** If  $f(t) = \begin{bmatrix} \cos t & t & 1 \\ 2\sin t & t & 2t \\ \sin t & t & t \end{bmatrix}$ , then  $\lim_{t \rightarrow 0} \frac{f(t)}{t^2}$  is equal to

- (a) 0      (b) -1      (c) 2      (d) 3

**Sol. (a)** We have,

$$f(t) = \begin{vmatrix} \cos t & t & 1 \\ 2\sin t & t & 2t \\ \sin t & t & t \end{vmatrix}$$

Expanding along  $C_1$ ,

$$\begin{aligned} &= \cos t (t^2 - 2t^2) - 2\sin t (t^2 - t) + \sin t (2t^2 - t) \\ &= -t^2 \cos t - (t^2 - t) 2\sin t + (2t^2 - t) \sin t \\ &= -t^2 \cos t - t^2 \cdot 2\sin t + t \cdot 2\sin t + 2t^2 \sin t \\ &= -t^2 \cos t + 2t \sin t \end{aligned}$$

$$\begin{aligned} \therefore \lim_{t \rightarrow 0} \frac{f(t)}{t^2} &= \lim_{t \rightarrow 0} \frac{(-t^2 \cos t)}{t^2} + \lim_{t \rightarrow 0} \frac{2t \sin t}{t^2} \\ &= -\lim_{t \rightarrow 0} \cos t + 2 \cdot \lim_{t \rightarrow 0} \frac{\sin t}{t} \\ &= -1 + 1 \quad \left[ \because \lim_{t \rightarrow 0} \frac{\sin t}{t} = 1 \text{ and } \cos 0 = 1 \right] \\ &= 0 \end{aligned}$$

**Q. 31** The maximum value of

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 + \cos \theta & 1 & 1 \end{vmatrix} \text{ is (where, } \theta \text{ is real number)}$$

- (a)  $\frac{1}{2}$       (b)  $\frac{\sqrt{3}}{2}$       (c)  $\sqrt{2}$       (d)  $\frac{2\sqrt{3}}{4}$

**Sol. (a)** Since,

$$\begin{aligned} \Delta &= \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 + \cos \theta & 1 & 1 \end{vmatrix} \\ &= \begin{vmatrix} 0 & 0 & 1 \\ 0 & \sin \theta & 1 \\ \cos \theta & 0 & 1 \end{vmatrix} \quad [ \because C_1 \rightarrow C_1 - C_3 \text{ and } C_2 \rightarrow C_2 - C_3 ] \\ &= 1 (\sin \theta \cdot \cos \theta) \\ &= \frac{1}{2} \cdot 2 \sin \theta \cos \theta = \frac{1}{2} \sin 2\theta \end{aligned}$$

Since, the maximum value of  $\sin 2\theta$  is 1. So, for maximum value of  $\theta$  should be  $45^\circ$ .

$$\begin{aligned} \therefore \Delta &= \frac{1}{2} \sin 2 \cdot 45^\circ \\ &= \frac{1}{2} \sin 90^\circ = \frac{1}{2} \cdot 1 = \frac{1}{2} \end{aligned}$$

**Q. 32** If  $f(x) = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix}$ , then

- (a)  $f(a) = 0$       (b)  $f(b) = 0$       (c)  $f(0) = 0$       (d)  $f(1) = 0$

**Sol. (c)** We have,

$$\begin{aligned} f(x) &= \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix} \\ \Rightarrow f(a) &= \begin{vmatrix} 0 & 0 & a-b \\ 2a & 0 & a-c \\ a+b & a+c & 0 \end{vmatrix} \\ &= [(a-b)\{2a \cdot (a+c)\}] \neq 0 \\ \therefore f(b) &= \begin{vmatrix} 0 & b-a & 0 \\ b+a & 0 & b-c \\ 2b & b+c & 0 \end{vmatrix} \\ &= -(b-a)[2b(b-c)] \\ &= -2b(b-a)(b-c) \neq 0 \\ \therefore f(0) &= \begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix} \\ &= a(bc) - b(ac) \\ &= abc - abc = 0 \end{aligned}$$

**Q. 33** If  $A = \begin{vmatrix} 2 & \lambda & -3 \\ 0 & 2 & 5 \\ 1 & 1 & 3 \end{vmatrix}$ , then  $A^{-1}$  exists, if

- (a)  $\lambda = 2$       (b)  $\lambda \neq 2$   
 (c)  $\lambda \neq -2$       (d) None of these

**Sol. (d)** We have,

$$A = \begin{vmatrix} 2 & \lambda & -3 \\ 0 & 2 & 5 \\ 1 & 1 & 3 \end{vmatrix}$$

Expanding along  $R_1$ ,

$$|A| = 2(6-5) - \lambda(-5) - 3(-2) = 2 + 5\lambda + 6$$

We know that,  $A^{-1}$  exists, if  $A$  is non-singular matrix i.e.,  $|A| \neq 0$ .

$$\begin{aligned} \therefore 2 + 5\lambda + 6 &\neq 0 \\ \Rightarrow 5\lambda &\neq -8 \\ \therefore \lambda &\neq \frac{-8}{5} \end{aligned}$$

So,  $A^{-1}$  exists if and only if  $\lambda \neq \frac{-8}{5}$ .

**Q. 34** If  $A$  and  $B$  are invertible matrices, then which of the following is not correct?

- |  |                                      |
|--|--------------------------------------|
| (a) $\text{adj } A =  A  \cdot A^{-1}$ | (b) $\det(A)^{-1} = [\det(A)]^{-1}$  |
| (c) $(AB)^{-1} = B^{-1} A^{-1}$        | (d) $(A + B)^{-1} = B^{-1} + A^{-1}$ |

**Sol. (d)** Since,  $A$  and  $B$  are invertible matrices. So, we can say that

$$(AB)^{-1} = B^{-1} A^{-1} \quad \dots(i)$$

Also,

$$A^{-1} = \frac{1}{|A|} (\text{adj } A)$$

$\Rightarrow$

$$\text{adj } A = |A| \cdot A^{-1}$$

$\dots(ii)$

Also,

$$\det(A)^{-1} = [\det(A)]^{-1}$$

$\Rightarrow$

$$\det(A)^{-1} = \frac{1}{[\det(A)]}$$

$$\Rightarrow \det(A) \cdot \det(A)^{-1} = 1 \quad \dots(iii)$$

which is true.

Again,

$$(A + B)^{-1} = \frac{1}{|(A + B)|} \text{adj}(A + B)$$

$\Rightarrow$

$$(A + B)^{-1} \neq B^{-1} + A^{-1} \quad \dots(iv)$$

So, only option (d) is incorrect.

**Q. 35** If  $x, y$  and  $z$  are all different from zero and

$$\begin{vmatrix} 1+x & 1 & 1 \\ 1 & 1+y & 1 \\ 1 & 1 & 1+z \end{vmatrix} = 0,$$

then the value of  $x^{-1} + y^{-1} + z^{-1}$  is

- (a)  $xyz$       (b)  $x^{-1}y^{-1}z^{-1}$       (c)  $-x - y - z$       (d)  $-1$

**Sol. (d)** We have,

$$\begin{vmatrix} 1+x & 1 & 1 \\ 1 & 1+y & 1 \\ 1 & 1 & 1+z \end{vmatrix} = 0$$

Applying  $C_1 \rightarrow C_1 - C_3$  and  $C_2 \rightarrow C_2 - C_3$ ,

$$\Rightarrow \begin{vmatrix} x & 0 & 1 \\ 0 & y & 1 \\ -z & -z & 1+z \end{vmatrix} = 0$$

Expanding along  $R_1$ ,

$$x [y(1+z) + 0 + 1(yz)] - 0 + 1(yz) = 0$$

$$\Rightarrow x(y + yz + z) + yz = 0$$

$$\Rightarrow xy + xyz + xz + yz = 0$$

$$\Rightarrow \frac{xy}{xyz} + \frac{xyz}{xyz} + \frac{xz}{xyz} + \frac{yz}{xyz} = 0 \quad [\text{on dividing } (xyz) \text{ from both sides}]$$

$$\Rightarrow \frac{1}{x} + \frac{1}{y} + \frac{1}{z} + 1 = 0$$

$$\Rightarrow \frac{1}{x} + \frac{1}{y} + \frac{1}{z} = -1$$

$$\therefore x^{-1} + y^{-1} + z^{-1} = -1$$

**Q. 36** The value of  $\begin{vmatrix} x & x+y & x+2y \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix}$  is

- (a)  $9x^2(x + y)$       (b)  $9y^2(x + y)$   
 (c)  $3y^2(x + y)$       (d)  $7x^2(x + y)$

**Sol. (b)** We have,

$$\begin{aligned}
 &= \begin{vmatrix} x & x+y & x+2y \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix} \\
 &= \begin{vmatrix} 3(x+y) & x+y & y \\ 3(x+y) & x & y \\ 3(x+y) & x+2y & -2y \end{vmatrix} \quad [ \because C_1 \rightarrow C_1 + C_2 + C_3 \text{ and } C_3 \rightarrow C_3 - C_2 ] \\
 &= 3(x+y) \begin{vmatrix} 1 & (x+y) & y \\ 1 & x & y \\ 1 & (x+2y) & -2y \end{vmatrix} \quad [\text{taking } 3(x+y) \text{ common from first column}] \\
 &= 3(x+y) \begin{vmatrix} 0 & y & 0 \\ 1 & x & y \\ 1 & (x+2y) & -2y \end{vmatrix} \quad [ \because R_1 \rightarrow R_1 - R_2 ]
 \end{aligned}$$

Expanding along  $R_1$ ,

$$= 3(x + y)[-y(-2y - y)]$$

**Q. 37** If there are two values of  $a$  which makes determinant,

$$\Delta = \begin{vmatrix} 1 & -2 & 5 \\ 2 & a & -1 \\ 0 & 4 & 2a \end{vmatrix} = 86, \text{ then the sum of these number is}$$

**Sol. (c)** We have,

$$\Delta = \begin{vmatrix} 1 & -2 & 5 \\ 2 & a & -1 \\ 0 & 4 & 2a \end{vmatrix} = 86$$

$$\Rightarrow 1(2a^2 + 4) - 2(-4a - 20) + 0 = 86 \quad [\text{expanding along first column}]$$

$$\Rightarrow 2a^2 + 4 + 8a + 40 = 86$$

$$2a^2 + 8a + 44 - 86 = 0$$

$$a^2 + 4a - 21 = 0$$

$$a^2 + 7a - 3a - 21 = 0$$

$$(a + 7)(a - 3) = 0$$

$$a = -$$

$$m = -7 + 3 =$$

## Fillers

**Q. 38** If  $A$  is a matrix of order  $3 \times 3$ , then  $|3A|$  is equal to ..... .

**Sol.** If  $A$  is a matrix of order  $3 \times 3$ , then  $|3A| = 3 \times 3 \times 3 |A| = 27 |A|$

**Q. 39** If  $A$  is invertible matrix of order  $3 \times 3$ , then  $|A^{-1}|$  is equal to ..... .

**Sol.** If  $A$  is invertible matrix of order  $3 \times 3$ , then  $|A^{-1}| = \frac{1}{|A|}$ . [since,  $|A| \cdot |A^{-1}| = 1$ ]

**Q. 40** If  $x, y, z \in R$ , then the value of  $\begin{vmatrix} (2^x + 2^{-x})^2 & (2^x - 2^{-x})^2 & 1 \\ (3^x + 3^{-x})^2 & (3^x - 3^{-x})^2 & 1 \\ (4^x + 4^{-x})^2 & (4^x - 4^{-x})^2 & 1 \end{vmatrix}$  is

**Sol.** We have,

$$\begin{aligned} & \begin{vmatrix} (2^x + 2^{-x})^2 & (2^x - 2^{-x})^2 & 1 \\ (3^x + 3^{-x})^2 & (3^x - 3^{-x})^2 & 1 \\ (4^x + 4^{-x})^2 & (4^x - 4^{-x})^2 & 1 \end{vmatrix} \\ &= \begin{vmatrix} (2 \cdot 2^x)(2 \cdot 2^{-x}) & (2^x - 2^{-x})^2 & 1 \\ (2 \cdot 3^x)(2 \cdot 3^{-x}) & (3^x - 3^{-x})^2 & 1 \\ (2 \cdot 4^x)(2 \cdot 4^{-x}) & (4^x - 4^{-x})^2 & 1 \end{vmatrix} \quad [\because (a+b)^2 - (a-b)^2 = 4ab] \\ &= \begin{vmatrix} 4 & (2^x - 2^{-x})^2 & 1 \\ 4 & (3^x - 3^{-x})^2 & 1 \\ 4 & (4^x - 4^{-x})^2 & 1 \end{vmatrix} = 0 \quad [\text{since, } C_1 \text{ and } C_3 \text{ are proportional to each other}] \end{aligned}$$

**Q. 41** If  $\cos 2\theta = 0$ , then  $\begin{vmatrix} 0 & \cos \theta & \sin \theta \\ \cos \theta & \sin \theta & 0 \\ \sin \theta & 0 & \cos \theta \end{vmatrix}^2$  is equal to ..... .

**Sol.** Since,  $\cos 2\theta = 0$

$$\Rightarrow \cos 2\theta = \cos \frac{\pi}{2} \Rightarrow 2\theta = \frac{\pi}{2}$$

$$\Rightarrow \theta = \frac{\pi}{4}$$

$$\therefore \sin \frac{\pi}{4} = \frac{1}{\sqrt{2}} \text{ and } \cos \frac{\pi}{4} = \frac{1}{\sqrt{2}}$$

$$\therefore \begin{vmatrix} 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \end{vmatrix}^2$$

Expanding along  $R_1$ ,

$$= \left[ -\frac{1}{\sqrt{2}} \left( \frac{1}{2} \right) + \frac{1}{\sqrt{2}} \left( -\frac{1}{2} \right) \right]^2 = \left[ \frac{-2}{2\sqrt{2}} \right]^2 = \left( \frac{-1}{\sqrt{2}} \right)^2 = \frac{1}{2}$$

**Q. 42** If  $A$  is a matrix of order  $3 \times 3$ , then  $(A^2)^{-1}$  is equal to ..... .

**Sol.** If  $A$  is a matrix of order  $3 \times 3$ , then  $(A^2)^{-1} = (A^{-1})^2$ .

**Q. 43** If  $A$  is a matrix of order  $3 \times 3$ , then the number of minors in determinant of  $A$  are ..... .

**Sol.** If  $A$  is a matrix of order  $3 \times 3$ , then the number of minors in determinant of  $A$  are 9. [since, in a  $3 \times 3$  matrix, there are 9 elements]

**Q. 44** The sum of products of elements of any row with the cofactors of corresponding elements is equal to ..... .

**Sol.** The sum of products of elements of any row with the cofactors of corresponding elements is equal to value of the determinant.

$$\text{Let } \Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Expanding along  $R_1$ ,

$$\begin{aligned} \Delta &= a_{11}A_{11} + a_{12}A_{12} + a_{13}A_{13} \\ &= \text{Sum of products of elements of } R_1 \text{ with their} \\ &\quad \text{corresponding cofactors} \end{aligned}$$

**Q. 45** If  $x = -9$  is a root of  $\begin{vmatrix} x & 3 & 7 \\ 2 & x & 2 \\ 7 & 6 & x \end{vmatrix} = 0$ , then other two roots are ..... .

**Sol.** Since, 
$$\begin{vmatrix} x & 3 & 7 \\ 2 & x & 2 \\ 7 & 6 & x \end{vmatrix} = 0$$

Expanding along  $R_1$ ,

$$\begin{aligned} x(x^2 - 12) - 3(2x - 14) + 7(12 - 7x) &= 0 \\ \Rightarrow x^3 - 12x - 6x + 42 + 84 - 49x &= 0 \\ \Rightarrow x^3 - 67x + 126 &= 0 \end{aligned} \quad \dots(i)$$

Here,

$$\text{For } x = 2, 2^3 - 67 \times 2 + 126 = 134 - 134 = 0$$

Hence,  $x = 2$  is a root.

$$\text{For } x = 7, 7^3 - 67 \times 7 + 126 = 469 - 469 = 0$$

Hence,  $x = 7$  is also a root.

**Q. 46**  $\begin{vmatrix} 0 & xyz & x-z \\ y-x & 0 & y-z \\ z-x & z-y & 0 \end{vmatrix}$  is equal to ..... .

**Sol.** We have, 
$$\begin{vmatrix} 0 & xyz & x-z \\ y-x & 0 & y-z \\ z-x & z-y & 0 \end{vmatrix} = \begin{vmatrix} z-x & xyz & x-z \\ z-x & 0 & y-z \\ z-x & z-y & 0 \end{vmatrix} \quad [:\because C_1 \rightarrow C_1 - C_3]$$

$$= (z-x) \begin{vmatrix} 1 & xyz & x-z \\ 1 & 0 & y-z \\ 1 & z-y & 0 \end{vmatrix}$$
[taking  $(z-x)$  common from column 1]

Expanding along  $R_1$ ,

$$\begin{aligned} &= (z-x) [1 \cdot \{-(y-z)(z-y)\} - xyz(z-y) + (x-z)(z-y)] \\ &= (z-x)(z-y)(-y+z-xyz+x-z) \\ &= (z-x)(z-y)(x-y-xyz) \\ &= (z-x)(y-z)(y-x+xyz) \end{aligned}$$

**Q. 47** If  $f(x) = \begin{vmatrix} (1+x)^{17} & (1+x)^{19} & (1+x)^{23} \\ (1+x)^{23} & (1+x)^{29} & (1+x)^{34} \\ (1+x)^{41} & (1+x)^{43} & (1+x)^{47} \end{vmatrix}$   
 $= A + Bx + Cx^2 + \dots$ , then  $A$  is equal to ..... .

**Sol.** Since,

$$f(x) = (1+x)^{17} (1+x)^{23} (1+x)^{41} \begin{vmatrix} 1 & (1+x)^2 & (1+x)^6 \\ 1 & (1+x)^6 & (1+x)^{11} \\ 1 & (1+x)^2 & (1+x)^6 \end{vmatrix} = 0$$
[since,  $R_1$  and  $R_3$  are identical]

$\therefore$

$$A = 0$$

## True/False

**Q. 48**  $(A^3)^{-1} = (A^{-1})^3$ , where  $A$  is a square matrix and  $|A| \neq 0$ .

**Sol.** *True*

Since,  $(A^n)^{-1} = (A^{-1})^n$ , where  $n \in N$ .

**Q. 49**  $(aA)^{-1} = \frac{1}{a} A^{-1}$ , where  $a$  is any real number and  $A$  is a square matrix.

**Sol.** *False*

Since, we know that, if  $A$  is a non-singular square matrix, then for any scalar  $a$  (non-zero),  $aA$  is invertible such that

$$(aA) \left( \frac{1}{a} A^{-1} \right) = \left( a \cdot \frac{1}{a} \right) (A \cdot A^{-1}) \\ = I$$

i.e.,  $(aA)$  is inverse of  $\left( \frac{1}{a} A^{-1} \right)$  or  $(aA)^{-1} = \frac{1}{a} A^{-1}$ , where  $a$  is any non-zero scalar.

In the above statement  $a$  is any real number. So, we can conclude that above statement is false.

**Q. 50**  $|A^{-1}| \neq |A|^{-1}$ , where  $A$  is a non-singular matrix.

**Sol.** *False*

$|A^{-1}| = |A|^{-1}$ , where  $A$  is a non-singular matrix.

**Q. 51** If  $A$  and  $B$  are matrices of order 3 and  $|A|=5$ ,  $|B|=3$ , then  $|3AB|=27 \times 5 \times 3=405$ .

**Sol.** *True*

We know that,

$\therefore$

$$|AB| = |A| \cdot |B| \\ |3AB| = 3|AB| \\ = 3|A| \cdot |B| \\ = 3 \times 5 \times 3 = 405$$

**Q. 52** If the value of a third order determinant is 12, then the value of the determinant formed by replacing each element by its cofactor will be 144.

**Sol.** *True*

Let  $A$  is the determinant.

$$\therefore |A| = 12$$

Also, we know that, if  $A$  is a square matrix of order  $n$ , then  $|\text{adj } A| = |A|^{n-1}$

$$\text{For } n=3, |\text{adj } A| = |A|^{3-1} = |A|^2 \\ = (12)^2 = 144$$

**Q. 53**  $\begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix} = 0$ , where  $a, b$  and  $c$  are in AP.

**Sol.** *True*

Since,  $a, b$  and  $c$  are in AP, then  $2b = a + c$

$$\begin{aligned} & \therefore \begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix} = 0 \\ \Rightarrow & \begin{vmatrix} 2x+4 & 2x+6 & 2x+a+c \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix} = 0 \quad [:: R_1 \rightarrow R_1 + R_3] \\ \Rightarrow & \begin{vmatrix} 2(x+2) & 2(x+3) & 2(x+b) \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix} = 0 \quad [:: 2b = a + c] \\ \Rightarrow & 0 = 0 \quad [\text{since, } R_1 \text{ and } R_2 \text{ are in proportional to each other}] \end{aligned}$$

Hence, statement is true.

**Q. 54**  $|\text{adj } A| = |A|^2$ , where  $A$  is a square matrix of order two.

**Sol.** *False*

If  $A$  is a square matrix of order  $n$ , then

$$\begin{aligned} & |\text{adj } A| = |A|^{n-1} \\ \Rightarrow & |\text{adj } A| = |A|^{2-1} = |A| \quad [:: n=2] \end{aligned}$$

**Q. 55** The determinant  $\begin{vmatrix} \sin A & \cos A & \sin A + \cos B \\ \sin B & \cos A & \sin B + \cos B \\ \sin C & \cos A & \sin C + \cos B \end{vmatrix}$  is equal to zero.

**Sol.** *True*

$$\begin{aligned} \text{Since, } & \begin{vmatrix} \sin A & \cos A & \sin A + \cos B \\ \sin B & \cos A & \sin B + \cos B \\ \sin C & \cos A & \sin C + \cos B \end{vmatrix} = \begin{vmatrix} \sin A & \cos A & \sin A \\ \sin B & \cos A & \sin B \\ \sin C & \cos A & \sin C \end{vmatrix} + \begin{vmatrix} \sin A & \cos A & \cos B \\ \sin B & \cos A & \cos B \\ \sin C & \cos A & \cos B \end{vmatrix} \\ & = 0 + \begin{vmatrix} \sin A & \cos A & \cos B \\ \sin B & \cos A & \cos B \\ \sin C & \cos A & \cos B \end{vmatrix} \\ & \quad [\text{since, in first determinant } C_1 \text{ and } C_3 \text{ are identicals}] \\ & = \cos A \cdot \cos B \begin{vmatrix} \sin A & 1 & 1 \\ \sin B & 1 & 1 \\ \sin C & 1 & 1 \end{vmatrix} \\ & \quad [\text{taking } \cos A \text{ common from } C_2 \text{ and } \cos B \text{ common from } C_3] \\ & = 0 \quad [\text{since, } C_2 \text{ and } C_3 \text{ are identicals}] \end{aligned}$$

**Q. 56** If the determinant  $\begin{vmatrix} x+a & p+u & l+f \\ y+b & q+v & m+g \\ z+c & r+w & n+h \end{vmatrix}$  splits into exactly  $k$

determinants of order 3, each element of which contains only one term, then the value of  $k$  is 8.

**Sol.** True

$$\begin{aligned} \text{Since, } & \begin{vmatrix} x+a & p+u & l+f \\ y+b & q+v & m+g \\ z+c & r+w & n+h \end{vmatrix} \\ &= \begin{vmatrix} x & p & l \\ y+b & q+v & m+g \\ z+c & r+w & n+h \end{vmatrix} + \begin{vmatrix} a & u & f \\ y+b & q+v & m+g \\ z+c & r+w & n+h \end{vmatrix} \quad [\text{splitting first row}] \\ &= \begin{vmatrix} x & p & l \\ y & q & m \\ z+c & r+m & n+h \end{vmatrix} + \begin{vmatrix} x & p & l \\ b & v & g \\ z+c & r+w & n+h \end{vmatrix} \\ &\quad + \begin{vmatrix} a & u & f \\ y & q & m \\ z+c & r+w & n+h \end{vmatrix} + \begin{vmatrix} a & u & f \\ b & v & g \\ z+c & r+w & n+h \end{vmatrix} \quad [\text{splitting second row}] \end{aligned}$$

Similarly, we can split these 4 determinants in 8 determinants by splitting each one in two determinants further. So, given statement is true.

**Q. 57** If  $\Delta = \begin{vmatrix} a & p & x \\ b & q & y \\ c & r & z \end{vmatrix} = 16$ , then  $\Delta_1 = \begin{vmatrix} p+x & a+x & a+p \\ q+y & b+y & b+q \\ r+z & c+z & c+r \end{vmatrix} = 32$ .

**Sol.** True

$$\begin{aligned} \text{We have, } & \Delta = \begin{vmatrix} a & p & x \\ b & q & y \\ c & r & z \end{vmatrix} = 16 \\ \text{and we have to prove, } & \Delta_1 = \begin{vmatrix} p+x & a+x & a+p \\ q+y & b+y & b+q \\ r+z & c+z & c+r \end{vmatrix} = 32 \\ & \Delta_1 = \begin{vmatrix} 2p+2x+2a & a+x & a+p \\ 2q+2y+2b & b+y & b+q \\ 2r+2z+2c & c+z & c+r \end{vmatrix} \quad [:: C_1 \rightarrow C_1 + C_2 + C_3] \\ &= 2 \begin{vmatrix} p & x-p & a+p \\ q & y-q & b+q \\ r & z-r & c+r \end{vmatrix} \end{aligned}$$

[taking 2 common from  $C_1$  and then  $C_1 \rightarrow C_1 - C_2$ ,  $C_2 \rightarrow C_2 - C_3$ ]

$$= 2 \begin{bmatrix} p & x & a+p \\ q & y & b+q \\ r & z & c+r \end{bmatrix} - \begin{bmatrix} p & p & a+p \\ q & q & b+q \\ r & r & c+r \end{bmatrix}$$

$$= 2 \begin{vmatrix} p & x & a+p \\ q & y & b+q \\ r & z & c+r \end{vmatrix} - 0$$

[since, two columns  $C_1$  and  $C_2$  are identicals]

$$\begin{aligned} &= 2 \begin{vmatrix} p & x & a \\ q & y & b \\ r & z & c \end{vmatrix} + 2 \begin{vmatrix} p & x & p \\ q & y & q \\ r & z & r \end{vmatrix} \\ &= 2 \begin{vmatrix} a & p & x \\ b & q & y \\ c & r & z \end{vmatrix} + 0 \end{aligned}$$

[since,  $C_1$  and  $C_3$  are identical in second determinant and in first determinant,  $C_1 \leftrightarrow C_2$   
and then  $C_1 \leftrightarrow C_3$ ]  
 $= 2 \times 16$   
 $= 32$

[ $\because \Delta = 16$ ]

Hence proved.

**Q. 58** The maximum value of  $\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 1 & 1 + \cos \theta \end{vmatrix}$  is  $\frac{1}{2}$ .

**Sol.** True

Since,  $\begin{vmatrix} 1 & 1 & 1 \\ 0 & \sin \theta & 0 \\ 0 & 0 & \cos \theta \end{vmatrix}$  [ $\because R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ ]

On expanding along third row, we get the value of the determinant

$$= \cos \theta \cdot \sin \theta = \frac{1}{2} \sin 2\theta = \frac{1}{2}$$

[when  $\theta$  is  $45^\circ$  which gives maximum value]
