EXERCISE 1.1

1.	(C)	2.	(D)	3. (C)	4. (B)	5.	(A)
6.	(B)	7.	(C)	8. (A)	9. (D)	10.	(D)

EXERCISE 1.2

- 1. No, because an integer can be written in the form 4q, 4q+1, 4q+2, 4q+3.
- 2. True, because n(n+1) will always be even, as one out of n or (n+1) must be even.
- 3. True, because n(n+1)(n+2) will always be divisible by 6, as atleast one of the factors will be divisible by 2 and atleast one of the factors will be divisible by 3.
- 4. No. Since any positive integer can be written as 3q, 3q+1, 3q+2,

therefore, square will be $9q^2 = 3m$, $9q^2 + 6q + 1 = 3(3q^2 + 2q) + 1 = 3m + 1$, $9q^2 + 12q + 3 + 1 = 3m + 1$.

CLICK HERE

R www.studentbro.in

- 5. No. $(3q + 1)^2 = 9q^2 + 6q + 1 = 3(3q^2 + 2q) = 3m + 1$.
- 6. HCF = 75, as HCF is the highest common factor.
- 7. $3 \times 5 \times 7 + 7 = 7 (3 \times 5 + 1) = 7 (16)$, which has more than two factors.
- 8. No, because HCF (18) does not divide LCM (380).

9. Terminating decimal expansion, because $\frac{987}{10500} = \frac{47}{500}$ and $500 = 5^3 = 2^2$

 $\left[\frac{987}{10500} = \frac{329}{3500} = \frac{329}{2^2 \cdot 5^3 \cdot 7} = \frac{47}{2^2 5^3} = .094.\right]$

10. Since 327.7081 is a terminating decimal number, so q must be of the form $2^{m}.5^{n}$; m, n are natural numbers.

1. Not always, because for calculating median of a grouped data, the formula used is

- Not always, because for calculating median of a grouped data, the formula used is based on the assumption that the observations in the classes are uniformly distributed (or equally spaced).
- 2. Not necessary, the mean of the data does not depend on the choice of *a* (assumed mean).
- **3.** No, it is not always the case. The values of these three measures can be the same. It depends on the type of data.
- 4. Not always. It depends on the data.
- 5. No, the outcomes are not equally likely. For example, outcome 'one girl' means *gbb, bgb, bbg* 'three girls' means *ggg* and so on.
- 6. No, the outcomes are not equally likely. The outcome '3' is more likely than the others.

7. Peehu; probability of Apoorv's getting 36 $\frac{1}{36}$ while probability of Peehu's getting

$$36 \quad \frac{1}{6} \quad \frac{6}{36}$$

R www.studentbro.in

- 8. Yes, the probability of each outcome is $\frac{1}{2}$, since the two outcomes are equally likely.
- 9. No, outcomes '1' and 'not 1' are not equally likely, $P(1) = \frac{1}{6}$, $P(not 1) = \frac{5}{6}$,
- **10.** No, the outcomes are not equally likely. Outcome 'no head' means 'TTT'; outcome 'one head' means THT, HTT, TTH and so on. P (TTT) = $\frac{1}{8}$, P (one head) = $\frac{3}{8}$ and so on.
- **11.** No, the outcomes 'head' and 'tail' are equally likely every time regardless of what you get in a few tosses.
- 12. It could be a tail or head as both the outcomes are equally likely, in each toss.
- **13.** No, head and tail are equally likely. So, no question of expecting a tail to have a higher chance in the 4th toss.
- **14.** Yes, the outcomes 'odd number', 'even number' are equally likely in the situation considered.
