# 6. Determinants

# Exercise 6.1

## **1 A. Question**

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

$$\mathbf{A} = \begin{bmatrix} 5 & 20 \\ 0 & -1 \end{bmatrix}$$

### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of the matrix can be obtained for a particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

Also,  $C_{ij} = (-1)^{i+j} \times M_{ij}$   $A = \begin{bmatrix} 5 & 20 \\ 0 & -1 \end{bmatrix}$   $M_{11} = -1$   $M_{21} = 20$   $C_{11} = (-1)^{1+1} \times M_{11}$   $= 1 \times -1$  = -1  $C_{21} = (-1)^{2+1} \times M_{21}$   $= 20 \times -1$  = -20Now expanding along the first column we get  $|A| = a_{11} \times C_{11} + a_{21} \times C_{21}$ 

 $= 5 \times (-1) + 0 \times (-20)$ 

= -5

## 1 B. Question

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

$$\mathbf{A} = \begin{bmatrix} -1 & 4\\ 2 & 3 \end{bmatrix}$$

#### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of matrix can be obtained for particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

Also,  $C_{ii} = (-1)^{i+j} \times M_{ii}$ 

 $A = \begin{bmatrix} -1 & 4 \\ 2 & 3 \end{bmatrix}$   $M_{11} = 3$   $M_{21} = 4$   $C_{11} = (-1)^{1+1} \times M_{11}$   $= 1 \times 3$  = 3  $C_{21} = (-1)^{2+1} \times 4$   $= -1 \times 4$ = -4

Now expanding along the first column we get

$$|A| = a_{11} \times C_{11} + a_{21} \times C_{21}$$
$$= -1 \times 3 + 2 \times (-4)$$
$$= -11$$

### 1 C. Question

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

	1	- 3	2]
A =	4	-1	2
	3	5	2

#### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of the matrix can be obtained for a particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

Also,  $C_{ij} = (-1)^{i+j} \times M_{ij}$ 

$$A = \begin{bmatrix} 1 & -3 & 2 \\ 4 & -1 & 2 \\ 3 & 5 & 2 \end{bmatrix}$$
  

$$\Rightarrow M_{11} = \begin{bmatrix} -1 & 2 \\ 5 & 2 \end{bmatrix}$$
  

$$M_{11} = -1 \times 2 - 5 \times 2$$
  

$$M_{11} = -12$$
  

$$\Rightarrow M_{21} = \begin{bmatrix} -3 & 2 \\ 5 & 2 \end{bmatrix}$$
  

$$M_{21} = -3 \times 2 - 5 \times 2$$
  

$$M_{21} = -16$$
  

$$\Rightarrow M_{31} = \begin{bmatrix} -3 & 2 \\ -1 & 2 \end{bmatrix}$$
  

$$M_{31} = -3 \times 2 - (-1) \times 2$$

 $M_{31} = -4$   $C_{11} = (-1)^{1+1} \times M_{11}$   $= 1 \times -12$  = -12  $C_{21} = (-1)^{2+1} \times M_{21}$   $= -1 \times -16$  = 16  $C_{31} = (-1)^{3+1} \times M_{31}$   $= 1 \times -4$  = -4

Now expanding along the first column we get

 $|A| = a_{11} \times C_{11} + a_{21} \times C_{21} + a_{31} \times C_{31}$ = 1× (-12) + 4 × 16 + 3× (-4) = -12 + 64 -12 = 40

### 1 D. Question

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

$$\mathbf{A} = \begin{bmatrix} 1 & \mathbf{a} & \mathbf{bc} \\ 1 & \mathbf{b} & \mathbf{ca} \\ 1 & \mathbf{c} & \mathbf{ab} \end{bmatrix}$$

#### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of the matrix can be obtained for a particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

Also,  $C_{ij} = (-1)^{i+j} \times M_{ij}$  $A = \begin{bmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{bmatrix}$   $\Rightarrow M_{11} = \begin{bmatrix} b & ca \\ c & ab \end{bmatrix}$   $M_{11} = b \times ab - c \times ca$   $M_{11} = ab^{2} - ac^{2}$   $\Rightarrow M_{21} = \begin{bmatrix} a & bc \\ c & ab \end{bmatrix}$   $M_{21} = a \times ab - c \times bc$   $M_{21} = a^{2}b - c^{2}b$ 

 $\Rightarrow M_{31} = \begin{bmatrix} a & bc \\ b & ca \end{bmatrix}$   $M_{31} = a \times ca - b \times bc$   $M_{31} = a^{2}c - b^{2}c$   $C_{11} = (-1)^{1+1} \times M_{11}$   $= 1 \times (ab^{2} - ac^{2})$   $= ab^{2} - ac^{2}$   $C_{21} = (-1)^{2+1} \times M_{21}$   $= -1 \times (a^{2}b - c^{2}b)$   $= c^{2}b - a^{2}b$   $C_{31} = (-1)^{3+1} \times M_{31}$   $= 1 \times (a^{2}c - b^{2}c)$   $= a^{2}c - b^{2}c$ Now expanding along the first column we get

 $|A| = a_{11} \times C_{11} + a_{21} \times C_{21} + a_{31} \times C_{31}$ = 1× (ab<sup>2</sup> - ac<sup>2</sup>) + 1 × (c<sup>2</sup>b - a<sup>2</sup>b) + 1× (a<sup>2</sup>c - b<sup>2</sup>c) = ab<sup>2</sup> - ac<sup>2</sup> + c<sup>2</sup>b - a<sup>2</sup>b + a<sup>2</sup>c - b<sup>2</sup>c

#### 1 E. Question

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

 $\mathbf{A} = \begin{bmatrix} 0 & 2 & 6 \\ 1 & 5 & 0 \\ 3 & 7 & 1 \end{bmatrix}$ 

#### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of matrix can be obtained for particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

Also,  $C_{ij} = (-1)^{i+j} \times M_{ij}$  $A = \begin{bmatrix} 0 & 2 & 6 \\ 1 & 5 & 0 \\ 3 & 7 & 1 \end{bmatrix}$   $\Rightarrow M_{11} = \begin{bmatrix} 5 & 0 \\ 7 & 1 \end{bmatrix}$   $M_{11} = 5 \times 1 - 7 \times 0$   $M_{11} = 5$   $\Rightarrow M_{21} = \begin{bmatrix} 2 & 6 \\ 7 & 1 \end{bmatrix}$ 

 $M_{21} = 2 \times 1 - 7 \times 6$ 

 $M_{21} = -40$  $\Rightarrow M_{31} = \begin{bmatrix} 2 & 6 \\ 5 & 0 \end{bmatrix}$  $M_{31} = 2 \times 0 - 5 \times 6$  $M_{31} = -30$  $C_{11} = (-1)^{1+1} \times M_{11}$  $= 1 \times 5$ = 5  $C_{21} = (-1)^{2+1} \times M_{21}$  $= -1 \times -40$ = 40 $C_{31} = (-1)^{3+1} \times M_{31}$  $= 1 \times -30$ = -30 Now expanding along the first column we get  $|A| = a_{11} \times C_{11} + a_{21} \times C_{21} + a_{31} \times C_{31}$  $= 0 \times 5 + 1 \times 40 + 3 \times (-30)$ 

= 0 + 40 - 90

= 50

# 1 F. Question

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

 $\mathbf{A} = \begin{bmatrix} \mathbf{a} & \mathbf{h} & \mathbf{g} \\ \mathbf{h} & \mathbf{b} & \mathbf{f} \\ \mathbf{g} & \mathbf{f} & \mathbf{c} \end{bmatrix}$ 

#### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of matrix can be obtained for particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

Also,  $C_{ij} = (-1)^{i+j} \times M_{ij}$  $A = \begin{bmatrix} a & h & g \\ h & b & f \\ g & f & c \end{bmatrix}$   $\Rightarrow M_{11} = \begin{bmatrix} b & f \\ f & c \end{bmatrix}$   $M_{11} = b \times c - f \times f$   $M_{11} = bc - f^{2}$ 

 $\Rightarrow M_{21} = \begin{bmatrix} h & g \\ f & c \end{bmatrix}$   $M_{21} = h \times c - f \times g$   $M_{21} = hc - fg$   $\Rightarrow M_{31} = \begin{bmatrix} h & g \\ b & f \end{bmatrix}$   $M_{31} = h \times f - b \times g$   $M_{31} = hf - bg$   $C_{11} = (-1)^{1+1} \times M_{11}$   $= 1 \times (bc - f^2)$   $= bc - f^2$   $C_{21} = (-1)^{2+1} \times M_{21}$   $= -1 \times (hc - fg)$  = fg - hc  $C_{31} = (-1)^{3+1} \times M_{31}$   $= 1 \times (hf - bg)$  = hf - bg

Now expanding along the first column we get

 $|A| = a_{11} \times C_{11} + a_{21} \times C_{21} + a_{31} \times C_{31}$ = a× (bc- f<sup>2</sup>) + h× (fg - hc) + g× (hf - bg)

 $= abc- af^2 + hgf - h^2c + ghf - bg^2$ 

#### 1 G. Question

Write the minors and cofactors of each element of the first column of the following matrices and hence evaluate the determinant in each case:

	2	-1			
A =	-3 1	0	1 -1	-2	
A –	1	1	-1	1	
	2	-1	5	0	

#### Answer

Let  $M_{ij}$  and  $C_{ij}$  represents the minor and co-factor of an element, where i and j represent the row and column.

The minor of matrix can be obtained for particular element by removing the row and column where the element is present. Then finding the absolute value of the matrix newly formed.

```
Also, C_{ij} = (-1)^{i+j} \times M_{ij}
```

 $\mathbf{A} = \begin{bmatrix} 2 & -1 & 0 & 1 \\ -3 & 0 & 1 & -2 \\ 1 & 1 & -1 & 1 \\ 2 & -1 & 5 & 0 \end{bmatrix}$ 

 $\Rightarrow M_{11} = \begin{bmatrix} 0 & 1 & -2 \\ 1 & -1 & 1 \\ -1 & 5 & 0 \end{bmatrix}$  $\mathsf{M}_{11} = 0(-1 \times 0 - 5 \times 1) - 1(1 \times 0 - (-1) \times 1) + (-2)(1 \times 5 - (-1) \times (-1))$  $M_{11} = -9$  $\Rightarrow M_{21} = \begin{bmatrix} -1 & 0 & 1 \\ 1 & -1 & 1 \\ -1 & 5 & 0 \end{bmatrix}$  $\mathsf{M}_{21} = -1(-1 \times 0 - 5 \times 1) - 0(1 \times 0 - (-1) \times 1) + 1(1 \times 5 - (-1) \times (-1))$  $M_{21} = 9$  $\Rightarrow M_{31} = \begin{bmatrix} -1 & 0 & 1 \\ 0 & 1 & -2 \\ -1 & 5 & 0 \end{bmatrix}$  $M_{31} = -1(1 \times 0 - 5 \times (-2)) - 0(0 \times 0 - (-1) \times (-2)) + 1(0 \times 5 - (-1) \times 1)$  $M_{31} = -9$  $\Rightarrow \mathbf{M}_{41} = \begin{bmatrix} -1 & 0 & 1 \\ 0 & 1 & -2 \\ 1 & -1 & 1 \end{bmatrix}$  $\mathsf{M}_{41} = -1(1 \times 1 - (-1) \times (-2)) - 0(0 \times 1 - 1 \times (-2)) + 1(0 \times (-1) - 1 \times 1)$  $M_{41} = 0$  $C_{11} = (-1)^{1+1} \times M_{11}$  $= 1 \times (-9)$ = -9  $C_{21} = (-1)^{2+1} \times M_{21}$  $= -1 \times 9$ = -9 $C_{31} = (-1)^{3+1} \times M_{31}$  $= 1 \times -9$ = -9 $C_{41} = (-1)^{4+1} \times M_{41}$  $= -1 \times 0$ = 0Now expanding along the first column we get  $|\mathsf{A}| = \mathsf{a}_{11} \times \mathsf{C}_{11} + \mathsf{a}_{21} \times \mathsf{C}_{21} + \mathsf{a}_{31} \times \mathsf{C}_{31} + \mathsf{a}_{41} \times \mathsf{C}_{41}$  $= 2 \times (-9) + (-3) \times -9 + 1 \times (-9) + 2 \times 0$ = -18 + 27 - 9= 0 2. Question Evaluate the following determinants:

i. 
$$\begin{vmatrix} x & -7 \\ x & 5x + 1 \end{vmatrix}$$
  
ii. 
$$\begin{vmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{vmatrix}$$
  
iii. 
$$\begin{vmatrix} \cos 15^{\circ} & -\sin 15^{\circ} \\ \sin 75^{\circ} & \cos 75^{\circ} \end{vmatrix}$$
  
iv. 
$$\begin{vmatrix} a + ib & c + id \\ -c + id & a - ib \end{vmatrix}$$

### Answer

I. Let  $A = \begin{vmatrix} x & -7 \\ x & 5x+1 \end{vmatrix}$  $\Rightarrow |\mathsf{A}| = \mathsf{x}(\mathsf{5}\mathsf{x} + 1) - (-7)\mathsf{x}$  $|A| = 5x^2 + 8x$ II. Let  $A = \begin{vmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{vmatrix}$  $\Rightarrow$  |A| = cos $\theta$  × cos $\theta$  - (-sin $\theta$ ) x sin $\theta$  $|A| = \cos^2\theta + \sin^2\theta$ |A| = 1III. Let A =  $\begin{vmatrix} \cos 15^{\circ} & -\sin 15^{\circ} \\ \sin 75^{\circ} & \cos 75^{\circ} \end{vmatrix}$  $\Rightarrow$  |A| = cos15° × cos75° + sin15° x sin75°  $|A| = \cos(75 - 15)^{\circ}$  $|A| = \cos 60^{\circ}$ |A| = 0.5.IV. Let  $A = \begin{vmatrix} a + ib & c + id \\ -c + id & a - ib \end{vmatrix}$  $\Rightarrow |A| = (a + ib)(a - ib) - (c + id)(-c + id)$ = (a + ib)(a - ib) + (c + id)(c - id) $= a^2 - i^2 b^2 + c^2 - i^2 d^2$  $= a^2 - (-1)b^2 + c^2 - (-1)d^2$  $= a^2 + b^2 + c^2 + d^2$ 

#### 3. Question

Evaluate

 $\begin{vmatrix} 2 & 3 & 7 \\ 13 & 17 & 5 \\ 15 & 20 & 12 \end{vmatrix}^2$ 

Answer

Get More Learning Materials Here : 📕

CLICK HERE

Since |AB| = |A||B|  $|A| = \begin{vmatrix} 2 & 3 & 7 \\ 13 & 17 & 5 \\ 15 & 20 & 12 \end{vmatrix}$   $|A| = 2\begin{vmatrix} 17 & 5 \\ 20 & 12 \end{vmatrix} - 3\begin{vmatrix} 13 & 5 \\ 15 & 12 \end{vmatrix} + 7\begin{vmatrix} 13 & 17 \\ 15 & 20 \end{vmatrix}$   $= 2(17 \times 12 - 5 \times 20) - 3(13 \times 12 - 5 \times 15) + 7(13 \times 20 - 15 \times 17)$  = 2(204 - 100) - 3(156 - 75) + 7(260 - 255)  $= 2 \times 104 - 3 \times 81 + 7 \times 5$  = 208 - 243 + 35 = 0Now  $|A|^2 = |A| \times |A|$ 

# 4. Question

Show that  $\begin{vmatrix} \sin 10^\circ & -\cos 10^\circ \\ \sin 80^\circ & \cos 80^\circ \end{vmatrix} = 1$ 

## Answer

 $\operatorname{Let} A = \begin{vmatrix} \sin 10^{\circ} & -\cos 10^{\circ} \\ \sin 80^{\circ} & \cos 80^{\circ} \end{vmatrix}$ 

Using  $sin(A+B) = sinA \times cosB + cosA \times sinB$ 

 $\Rightarrow$  |A| = sin10° × cos80° + cos10° x sin80°

 $|A| = \sin(10 + 80)^{\circ}$ 

 $|A| = \sin 90^{\circ}$ 

$$|A| = 1$$

Hence Proved

## 5. Question

Evaluate  $\begin{vmatrix} 2 & 3 & -5 \\ 7 & 1 & -2 \\ -3 & 4 & 1 \end{vmatrix}$  by two methods.

## Answer

 $|\mathbf{A}| = \begin{vmatrix} 2 & 3 & -5 \\ 7 & 1 & -2 \\ -3 & 4 & 1 \end{vmatrix}$ 

I. Expanding along the first row

$$|\mathbf{A}| = 2 \begin{vmatrix} 1 & -2 \\ 4 & 1 \end{vmatrix} - 3 \begin{vmatrix} 7 & -2 \\ -3 & 1 \end{vmatrix} - 5 \begin{vmatrix} 7 & 1 \\ -3 & 4 \end{vmatrix}$$
$$= 2(1 \times 1 - 4 \times (-2)) - 3(7 \times 1 - (-2) \times (-3)) - 5(7 \times 4 - 1 \times (-3))$$
$$= 2(1 + 8) - 3(7 - 6) - 5(28 + 3)$$
$$= 2 \times 9 - 3 \times 1 - 5 \times 31$$

= 18 - 3 - 155

= -140

II. Expanding along the second column

$$|A| = 2 \begin{vmatrix} 1 & -2 \\ 4 & 1 \end{vmatrix} - 7 \begin{vmatrix} 3 & -5 \\ 4 & 1 \end{vmatrix} - 3 \begin{vmatrix} 3 & -5 \\ 1 & -2 \end{vmatrix}$$
  
= 2(1×1 - 4×(-2)) - 7(3×1 - 4×(-5)) - 3(3×(-2) - 1×(-5))  
= 2(1 + 8) - 7(3 + 20) - 3(-6 + 5)  
= 2×9 - 7×23 - 3×(-1)  
= 18 - 161 + 3  
= -140

### 6. Question

Evaluate :  $\Delta = \begin{vmatrix} 0 & \sin \alpha & -\cos \alpha \\ -\sin \alpha & 0 & \sin \beta \\ \cos \alpha & -\sin \beta & 0 \end{vmatrix}$ 

#### Answer

 $\Delta = \begin{vmatrix} 0 & \sin \alpha & -\cos \alpha \\ -\sin \alpha & 0 & \sin \beta \\ \cos \alpha & -\sin \beta & 0 \end{vmatrix}$ 

Expanding along the first row

 $|\mathbf{A}| = 0 \begin{vmatrix} 0 & \sin \beta \\ -\sin \beta & 0 \end{vmatrix} - \sin \alpha \begin{vmatrix} -\sin \alpha & \sin \beta \\ \cos \alpha & 0 \end{vmatrix} - \cos \alpha \begin{vmatrix} -\sin \alpha & 0 \\ \cos \alpha & -\sin \beta \end{vmatrix}$ 

 $\Rightarrow |\mathsf{A}| = 0(0 - \sin\beta(-\sin\beta)) - \sin\alpha(-\sin\alpha \times 0 - \sin\beta\cos\alpha) - \cos\alpha((-\sin\alpha)(-\sin\beta) - 0 \times \cos\alpha)$ 

 $|A| = 0 + \sin\alpha \sin\beta \cos\alpha - \cos\alpha \sin\alpha \sin\beta$ 

|A| = 0

## 7. Question

Evaluate :

	cosαcosβ	$\cos \alpha \sin \beta$	$-\sin \alpha$	
$\Delta =$	$-\sin\beta$	cosβ	0	
	$\sin \alpha \cos \beta$	$\sin\alpha\sin\beta$	cosα	

#### Answer

 $\Delta = \begin{bmatrix} \cos\alpha\cos\beta & \cos\alpha\sin\beta & -\sin\alpha \\ -\sin\beta & \cos\beta & 0 \\ \sin\alpha\cos\beta & \sin\alpha\sin\beta & \cos\alpha \end{bmatrix}$ 

Expanding along the second row

```
\begin{split} |A| &= \sin\beta \begin{vmatrix} \cos\alpha \sin\beta & -\sin\alpha \\ \sin\alpha \sin\beta & \cos\alpha \end{vmatrix} + \cos\beta \begin{vmatrix} \cos\alpha \cos\beta & -\sin\alpha \\ \sin\alpha \cos\beta & \cos\alpha \end{vmatrix} \\ &- 0 \begin{vmatrix} \cos\alpha \cos\beta & \cos\alpha \sin\beta \\ \sin\alpha \cos\beta & \sin\alpha \sin\beta \end{vmatrix} \end{split}
```

 $\Rightarrow |\mathsf{A}| = \sin\beta \left(\cos\alpha \times \cos\alpha \sin\beta + \sin\alpha \times \sin\alpha \sin\beta\right) + \cos\beta \left(\cos\alpha \cos\beta \times \cos\alpha + \sin\alpha \times \sin\alpha \cos\beta\right) - 0$ 

**CLICK HERE** 

>>>

🕀 www.studentbro.in

 $|\mathsf{A}| = \sin^2\beta (\cos^2\alpha + \sin^2\alpha) + \cos^2\beta (\cos^2\alpha + \sin^2\alpha)$ 

$$|A| = \sin^2 \beta (1) + \cos^2 \beta (1)$$
$$|A| = \sin^2 \beta + \cos^2 \beta$$

|A| = 1

# 8. Question

If 
$$A = \begin{bmatrix} 2 & 5 \\ 2 & 1 \end{bmatrix}$$
 and  $B = \begin{bmatrix} 4 & -3 \\ 2 & 5 \end{bmatrix}$ , verify that  $|AB| = |A| |B|$ .

# Answer

```
\mathbf{A} = \begin{bmatrix} 2 & 5 \\ 2 & 1 \end{bmatrix}
\mathbf{B} = \begin{bmatrix} 4 & -3 \\ 2 & 5 \end{bmatrix}
Now |A| = 2 \times 1 - 2 \times 5
 |A| = 2 - 10
 |A| = -8
Now |B| = 4 \times 5 - 2 \times (-3)
 |B| = 20 + 6
|B|= 26
 \Rightarrow |A| \times |B| = -8 \times 26
 |A| \times |B| = -208
Now
AB = \begin{bmatrix} 2 & 5 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 4 & -3 \\ 2 & 5 \end{bmatrix}
= \begin{bmatrix} 2 \times 4 + 5 \times 2 & 2 \times (-3) + 5 \times 5 \\ 2 \times 4 + 1 \times 2 & 2 \times (-3) + 1 \times 5 \end{bmatrix}
 = \begin{bmatrix} 8+10 & -6+25 \\ 8+2 & -6+5 \end{bmatrix} 
= \begin{bmatrix} 18 & 19 \\ 10 & -1 \end{bmatrix}
 |AB| = 18 \times (-1) - 19 \times 10
 |AB| = -18 - 190
 |AB| = -208
Hence |AB| = |A| \times |B|.
```

# 9. Question

If  $A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 4 \end{bmatrix}$ , then show that |3A| = 27|A|.

# Answer

 $|A| = \begin{vmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 4 \end{vmatrix}$ 

Expanding along the first row

 $|\mathbf{A}| = 1 \begin{vmatrix} 1 & 2 \\ 0 & 4 \end{vmatrix} - 0 \begin{vmatrix} 0 & 2 \\ 0 & 4 \end{vmatrix} + 1 \begin{vmatrix} 0 & 1 \\ 0 & 0 \end{vmatrix}$  $= 1(1 \times 4 - 2 \times 0) - 0(0 \times 4 - 0 \times 2) + 1(0 \times 0 - 0 \times 1)$ = 1(4 - 0) + 0 + 1(0 + 0) $= 1 \times 4$ = 4Now

 $|3A| = \begin{vmatrix} 3 & 0 & 3 \\ 0 & 3 & 6 \\ 0 & 0 & 12 \end{vmatrix}$ 

Expanding along the first row

 $|3A| = 3 \begin{vmatrix} 3 & 6 \\ 0 & 12 \end{vmatrix} - 0 \begin{vmatrix} 0 & 6 \\ 0 & 12 \end{vmatrix} + 3 \begin{vmatrix} 0 & 3 \\ 0 & 0 \end{vmatrix}$ = 3(3×12 - 6×0) - 0(0×12 - 0×6) + 3(0×0 - 0×3) = 3(36 - 0) + 0 + 3(0 + 0) = 3×36 = 108 = 27 × 4 = 27 |A| Hence, |3A|= 27 |A|

#### 10 A. Question

Find the value of x, if

$$\begin{vmatrix} 2 & 4 \\ 5 & 1 \end{vmatrix} = \begin{vmatrix} 2x & 4 \\ 6 & x \end{vmatrix}$$

#### Answer

 $\begin{vmatrix} 2 & 4 \\ 5 & 1 \end{vmatrix} = \begin{vmatrix} 2x & 4 \\ 6 & x \end{vmatrix}$   $\Rightarrow 2 \times 1 - 4 \times 5 = 2x \times x - 4 \times 6$   $\Rightarrow 2 - 20 = 2x^{2} - 24$   $\Rightarrow 2x^{2} = -18 + 24$   $\Rightarrow 2x^{2} = 6$   $\Rightarrow x^{2} = 3$  $\Rightarrow x = \pm \sqrt{3}$ 

# 10 B. Question

Find the value of x, if

 $\begin{vmatrix} 2 & 3 \\ 4 & 5 \end{vmatrix} = \begin{vmatrix} x & 3 \\ 2x & 5 \end{vmatrix}$ 

Answer

 $\begin{vmatrix} 2 & 3 \\ 4 & 5 \end{vmatrix} = \begin{vmatrix} x & 3 \\ 2x & 5 \end{vmatrix}$  $\Rightarrow 2 \times 5 - 4 \times 3 = x \times 5 - 2x \times 3$  $\Rightarrow 10 - 12 = 5x - 6x$  $\Rightarrow -x = -2$  $\Rightarrow x = 2$ 

## 10 C. Question

Find the value of x, if

 $\begin{vmatrix} 3 & x \\ x & 1 \end{vmatrix} = \begin{vmatrix} 3 & 2 \\ 4 & 1 \end{vmatrix}$ 

### Answer

 $\begin{vmatrix} 3 & x \\ x & 1 \end{vmatrix} = \begin{vmatrix} 3 & 2 \\ 4 & 1 \end{vmatrix}$   $\Rightarrow 3 \times 1 - x \times x = 3 \times 1 - 4 \times 2$   $\Rightarrow 3 - x^{2} = 3 - 8$   $\Rightarrow - x^{2} = -5 - 3$   $\Rightarrow -x^{2} = -8$  $\Rightarrow x = \pm 2\sqrt{2}$ 

### 10 D. Question

Find the value of x, if

$$\begin{vmatrix} 3x & 7 \\ 2 & 4 \end{vmatrix} = 10$$

#### Answer

 $\begin{vmatrix} 3x & 7 \\ 2 & 4 \end{vmatrix} = 10$   $\Rightarrow 3x \times 4 - 7 \times 2 = 10$   $\Rightarrow 12x - 14 = 10$   $\Rightarrow 12x = 10 + 14$   $\Rightarrow 12x = 24$  $\Rightarrow x = 2$ 

### 10 E. Question

Find the value of x, if

 $\begin{vmatrix} x+1 & x-1 \\ x-3 & x+2 \end{vmatrix} = \begin{vmatrix} 4 & -1 \\ 1 & 3 \end{vmatrix}$ 

### Answer

 $\begin{vmatrix} x+1 & x-1 \\ x-3 & x+2 \end{vmatrix} = \begin{vmatrix} 4 & -1 \\ 1 & 3 \end{vmatrix}$  $\Rightarrow (x+1)(x+2) - (x-1)(x-3) = 4 \times 3 - 1 \times (-1)$ 

 $\Rightarrow (x^{2} + 2x + x + 2) - (x^{2} - 3x - x + 3) = 12 + 1$  $\Rightarrow -2x - 1 = 13$  $\Rightarrow -2x = 14$  $\Rightarrow x = -7$ 

# 10 F. Question

Find the value of x, if

$$\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & 5 \\ 8 & 3 \end{vmatrix}$$

#### Answer

 $\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & 5 \\ 8 & 3 \end{vmatrix}$   $\Rightarrow 2x \times x - 5 \times 8 = 6 \times 3 - 5 \times 8$   $\Rightarrow 2x^{2} - 40 = 18 - 40$   $\Rightarrow 2x^{2} = 18$   $\Rightarrow x^{2} = 9$  $\Rightarrow x = \pm 3$ 

#### 11. Question

Find the integral value of x, if  $\begin{vmatrix} x^2 & x & 1 \\ 0 & 2 & 1 \\ 3 & 1 & 4 \end{vmatrix} = 28$ 

#### Answer

 $|A| = \begin{vmatrix} x^2 & x & 1 \\ 0 & 2 & 1 \\ 3 & 1 & 4 \end{vmatrix}$ 

Expanding along the first row

 $|\mathbf{A}| = \mathbf{x}^{2} \begin{vmatrix} 2 & 1 \\ 1 & 4 \end{vmatrix} - \mathbf{x} \begin{vmatrix} 0 & 1 \\ 3 & 4 \end{vmatrix} + 1 \begin{vmatrix} 0 & 2 \\ 3 & 1 \end{vmatrix}$  $= x^{2}(2 \times 4 - 1 \times 1) - x(0 \times 4 - 1 \times 3) + 1(0 \times 1 - 2 \times 3)$  $= x^{2}(8 - 1) - x(0 - 3) + 1(0 - 6)$  $= 7x^{2} + 3x - 6$ Also  $|\mathbf{A}| = 28$  $\Rightarrow 7x^{2} + 3x - 6 = 28$  $\Rightarrow 7x^{2} + 3x - 6 = 28$  $\Rightarrow 7x^{2} + 3x - 34 = 0$  $\Rightarrow 7x^{2} + 17x - 14x - 34 = 0$  $\Rightarrow x(7x + 17) - 2(7x + 17) = 0$  $\Rightarrow (x - 2)(7x + 17) = 0$  $\mathbf{x} = 2, -\frac{17}{7}$

Integer value of x is 2.

#### 12 A. Question

For what value of x matrix A is singular?

$$\mathbf{A} = \begin{bmatrix} 1 + \mathbf{x} & 7 \\ 3 - \mathbf{x} & 8 \end{bmatrix}$$

#### Answer

 $|\mathbf{A}| = 0$  $\begin{vmatrix} 1+x & 7\\ 3-x & 8 \end{vmatrix} = 0$  $\Rightarrow (1+x) \times 8 - 7 \times (3-x) = 0$  $\Rightarrow 8 + 8x - 21 + 7x = 0$  $\Rightarrow 15x - 13 = 0$  $\Rightarrow x = \frac{13}{15}$ 

#### 12 B. Question

For what value of x matrix A is singular?

	x -1	1	1
A =	1	x – 1	1
	1	1 x	-1

### Answer

 $|\mathbf{A}| = \begin{vmatrix} \mathbf{x} - \mathbf{1} & \mathbf{1} & \mathbf{1} \\ \mathbf{1} & \mathbf{x} - \mathbf{1} & \mathbf{1} \\ \mathbf{1} & \mathbf{1} & \mathbf{x} - \mathbf{1} \end{vmatrix}$ 

Expanding along the first row

$$|\mathbf{A}| = (\mathbf{x} - \mathbf{1}) \begin{vmatrix} \mathbf{x} - \mathbf{1} & \mathbf{1} \\ \mathbf{1} & \mathbf{x} - \mathbf{1} \end{vmatrix} - \mathbf{1} \begin{vmatrix} \mathbf{1} & \mathbf{1} \\ \mathbf{1} & \mathbf{x} - \mathbf{1} \end{vmatrix} + \mathbf{1} \begin{vmatrix} \mathbf{1} & \mathbf{x} - \mathbf{1} \\ \mathbf{1} & \mathbf{1} \end{vmatrix}$$
$$= (\mathbf{x} - \mathbf{1}) ((\mathbf{x} - \mathbf{1}) - \mathbf{1} \times \mathbf{1}) - \mathbf{1} \times (\mathbf{x} - \mathbf{1}) - \mathbf{1} \times \mathbf{1} + \mathbf{1} (\mathbf{1} \times \mathbf{1} - \mathbf{1} \times (\mathbf{x} - \mathbf{1}))$$
$$= (\mathbf{x} - \mathbf{1}) (\mathbf{x}^2 - 2\mathbf{x} + \mathbf{1} - \mathbf{1}) - \mathbf{1} (\mathbf{x} - \mathbf{1} - \mathbf{1}) + \mathbf{1} (\mathbf{1} - \mathbf{x} + \mathbf{1})$$
$$= \mathbf{x} (\mathbf{x} - \mathbf{1}) (\mathbf{x} - 2) - \mathbf{1} (\mathbf{x} - 2) - (\mathbf{x} - 2)$$
$$= (\mathbf{x} - 2) \{\mathbf{x} (\mathbf{x} - \mathbf{1}) - \mathbf{1} - \mathbf{1}\}$$
$$= (\mathbf{x} - 2) (\mathbf{x}^2 - \mathbf{x} - 2)$$
For singular  $|\mathbf{A}| = 0$ ,  
(x - 2) (x<sup>2</sup> - x - 2) = 0  
(x - 2) (x<sup>2</sup> - x - 2) = 0  
(x - 2) (x<sup>2</sup> - 2x + x - 2) = 0  
(x - 2) (x - 2) (x + \mathbf{1}) = 0
$$\therefore \mathbf{x} = -1 \text{ or } 2$$
Also  $|\mathbf{A}| = 28$ 
$$\Rightarrow 7\mathbf{x}^2 + 3\mathbf{x} - 6 = 28$$

 $\Rightarrow 7x^{2} + 3x - 34 = 0$  $\Rightarrow 7x^{2} + 17x - 14x - 34 = 0$  $\Rightarrow x(7x+17) - 2(7x + 17) = 0$  $\Rightarrow (x-2)(7x + 17) = 0$ 

## Exercise 6.2

## **1 A. Question**

Evaluate the following determinant:

### Answer

Let,  $\Delta = \begin{vmatrix} 1 & 3 & 5 \\ 2 & 6 & 10 \\ 31 & 11 & 38 \end{vmatrix} = 2 \begin{vmatrix} 1 & 3 & 5 \\ 1 & 3 & 5 \\ 31 & 11 & 38 \end{vmatrix}$ 

Applying,  $R_2 \rightarrow R_2 - R_1$ , we get,

$$\Rightarrow \Delta = 2 \begin{vmatrix} 1 & 3 & 5 \\ 0 & 0 & 0 \\ 31 & 11 & 38 \end{vmatrix} = 0$$

So, \Lambda = 🛛

# 1 B. Question

Evaluate the following determinant:

## Answer

Let,  $\Delta = \begin{vmatrix} 67 & 19 & 21 \\ 39 & 13 & 14 \\ 81 & 24 & 26 \end{vmatrix}$ 

Applying,  $C_1 \rightarrow C_1 - 4 C_3$ , we get,

 $\Rightarrow \Delta = \begin{vmatrix} 4 & 19 & 21 \\ -3 & 13 & 14 \\ -3 & 24 & 26 \end{vmatrix}$ 

Applying,  $R_1 \rightarrow R_1 + R_2$  and  $R_3 \rightarrow R_3 - R_2$ , we get

 $\Rightarrow \Delta = \begin{vmatrix} 1 & 32 & 35 \\ -3 & 13 & 14 \\ 0 & 11 & 12 \end{vmatrix}$ 

Now, applying  $R_2 \rightarrow R_2 + 3 R_1$ , we get,

 $\Rightarrow \Delta = \begin{vmatrix} 1 & 32 & 35 \\ 0 & 109 & 119 \\ 0 & 11 & 12 \end{vmatrix}$ = 1[(109)(12) - (119)(11)] = 1308 - 1309

= - 1

So, ∆ = - 1

# 1 C. Question

Evaluate the following determinant:

ahg hbf gfc

# Answer

Let,  $\Delta = \begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix}$  $= a(bc - f^2) - h(hc - fg) + g(hf - bg)$  $= abc - af^2 - ch^2 + fgh + fgh - bg^2$  $= abc + 2fgh - af^2 - bg^2 - ch^2$ So,  $\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$ 

# 1 D. Question

Evaluate the following determinant:

# Answer

Let,  $\Delta = \begin{vmatrix} 1 & -3 & 2 \\ 4 & -1 & 2 \\ 3 & 5 & 2 \end{vmatrix}$  $\Rightarrow \Delta = 2 \begin{vmatrix} 1 & -3 & 1 \\ 4 & -1 & 1 \\ 3 & 5 & 1 \end{vmatrix}$ 

Applying,  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get

$\Rightarrow \Delta = 2$	1 3 2	3 2 8	1 0 0	
= 2[1(24	- 4)]	= 4	0	
So, Δ = 40				

# 1 E. Question

Evaluate the following determinant:

## Answer

Let,  $\Delta = \begin{vmatrix} 1 & 4 & 9 \\ 4 & 9 & 16 \\ 9 & 16 & 25 \end{vmatrix}$ Applying  $C_3 \rightarrow C_3 - C_2$ , we get,

$$\Rightarrow \Delta = \begin{vmatrix} 1 & 4 & 5 \\ 4 & 9 & 7 \\ 9 & 16 & 9 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 + C_1$ , we get,

$$\Rightarrow \Delta = \begin{vmatrix} 1 & 5 & 5 \\ 4 & 13 & 7 \\ 9 & 25 & 9 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - 5C_1$  and  $C_3 \rightarrow C_3 - 5C_1$  we get,

$$\Rightarrow \Delta = \begin{vmatrix} 1 & 0 & 0 \\ 4 & -7 & -13 \\ 9 & -20 & -36 \end{vmatrix}$$
$$= 1[(-7)(-36) - (-20)(-13)] = 252 - 260$$
$$= -8$$
So,  $\Delta = -8$ 

## 1 F. Question

Evaluate the following determinant:

#### Answer

Let,  $\Delta = \begin{vmatrix} 6 & -3 & 2 \\ 2 & -1 & 2 \\ -10 & 5 & 2 \end{vmatrix}$ 

Applying,  $R_1 \rightarrow R_1 - 3R_2$  and  $R_3 \rightarrow R_3 + 5R_2$  we get,

$$\Rightarrow \Delta = \begin{vmatrix} 0 & 0 & -4 \\ 2 & -1 & 2 \\ 0 & 0 & 12 \end{vmatrix} = 0$$

So,  $\Delta = 0$ 

#### 1 G. Question

Evaluate the following determinant:

#### Answer

Let,  $\Delta = \begin{vmatrix} 1 & 3 & 9 & 27 \\ 3 & 9 & 27 & 1 \\ 9 & 27 & 1 & 3 \\ 27 & 1 & 3 & 9 \end{vmatrix}$ 

$$\Rightarrow \Delta = \begin{vmatrix} 1 & 3 & 3^2 & 3^3 \\ 3 & 3^2 & 3^3 & 1 \\ 3^2 & 3^3 & 1 & 3 \\ 3^3 & 1 & 3 & 3^2 \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 + C_2 + C_3 + C_4$ , we get,

$$\Rightarrow \Delta = \begin{vmatrix} 1+3+3^2+3^3 & 3 & 3^2 & 3^3 \\ 1+3+3^2+3^3 & 3^2 & 3^3 & 1 \\ 1+3+3^2+3^3 & 3^3 & 1 & 3 \\ 1+3+3^2+3^3 & 1 & 3 & 3^2 \end{vmatrix}$$
$$\Rightarrow \Delta = (1+3+3^2+3^3) \begin{vmatrix} 1 & 3 & 3^2 & 3^3 \\ 1 & 3^2 & 3^3 & 1 \\ 1 & 3^3 & 1 & 3 \\ 1 & 1 & 3 & 3^2 \end{vmatrix}$$

Now, applying  $R_2 \rightarrow R_2 - R_1$ ,  $R_3 \rightarrow R_3 - R_1$ ,  $R_4 \rightarrow R_4 - R_1$ , we get

$$\Rightarrow \Delta = (1 + 3 + 3^{2} + 3^{3}) \begin{vmatrix} 1 & 3 & 3^{2} & 3^{3} \\ 0 & 3^{2} - 3 & 3^{3} - 3^{2} & 1 - 3^{3} \\ 0 & 3^{3} - 3 & 1 - 3^{2} & 3 - 3^{3} \\ 0 & 1 - 3 & 3 - 3^{2} & 3^{2} - 3^{3} \end{vmatrix}$$
$$\Rightarrow \Delta = (1 + 3 + 3^{2} + 3^{3}) \begin{vmatrix} 6 & 18 & -26 \\ 24 & -8 & -24 \\ -2 & -6 & -18 \end{vmatrix}$$
$$\Rightarrow \Delta = (1 + 3 + 3^{2} + 3^{3}) 2^{3} \begin{vmatrix} 3 & -9 & 13 \\ 12 & 4 & 12 \\ -1 & 3 & 9 \end{vmatrix}$$

Now, applying  $R_1 \rightarrow R_1 + 3R_3$ 

$$\Rightarrow \Delta = (1 + 3 + 3^{2} + 3^{3})2^{3} \begin{vmatrix} 0 & 0 & 40 \\ 12 & 4 & 12 \\ -1 & 3 & 9 \end{vmatrix}$$
$$= (1 + 3 + 3^{2} + 3^{3})2^{3} [40(36 - (-4))]$$
$$= (40)(8)(40)(40) = 512000$$
So,  $\Delta = 512000$ 

#### 1 H. Question

Evaluate the following determinant:

102 18 36 1 3 4 17 3 6

### Answer

Let,  $\Delta = \begin{vmatrix} 102 & 18 & 36 \\ 1 & 3 & 4 \\ 17 & 3 & 6 \end{vmatrix}$  $\Rightarrow \Delta = 6 \begin{vmatrix} 17 & 3 & 6 \\ 1 & 3 & 4 \\ 17 & 3 & 6 \end{vmatrix}$ 

Applying  $R_3 \rightarrow R_3 - R_1$ , we get,

$$\Rightarrow \Delta = 6 \begin{vmatrix} 17 & 3 & 6 \\ 1 & 3 & 4 \\ 0 & 0 & 0 \end{vmatrix} = 0$$

So,  $\Delta = 0$ 

## 2 A. Question

Without expanding, show that the value of each of the following determinants is zero:

## Answer

Let,  $\Delta = \begin{vmatrix} 8 & 2 & 7 \\ 12 & 3 & 5 \\ 16 & 4 & 3 \end{vmatrix}$ 

Applying  $R_3 \rightarrow R_3 - R_2$ , we get

$$\Rightarrow \Delta = \begin{vmatrix} 8 & 2 & 7 \\ 12 & 3 & 5 \\ 4 & 1 & -2 \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Rightarrow \Delta = \begin{vmatrix} 8 & 2 & 7 \\ 4 & 1 & -2 \\ 4 & 1 & -2 \end{vmatrix}$$

As,  $R_2 = R_3$ , therefore the value of the determinant is zero.

## 2 B. Question

Without expanding, show that the value of each of the following determinants is zero:

#### Answer

Let, 
$$\Delta = \begin{vmatrix} 6 & -3 & 2 \\ 2 & -1 & 2 \\ -10 & 5 & 2 \end{vmatrix}$$

Taking ( – 2) common from  $C_1$  we get,

 $\Rightarrow \Delta = \begin{vmatrix} -3 & -3 & 2 \\ -1 & -1 & 2 \\ 5 & 5 & 2 \end{vmatrix}$ 

As,  $C_1 = C_2$ , hence the value of the determinant is zero.

# 2 C. Question

Without expanding, show that the value of each of the following determinants is zero:

2 3 7 13 17 5 15 20 12

#### Answer

Let,  $\Delta = \begin{vmatrix} 2 & 3 & 7 \\ 13 & 17 & 5 \\ 15 & 20 & 12 \end{vmatrix}$ 

Applying  $C_3 \rightarrow C_3 - C_2$ , gives

$$\Rightarrow \Delta = \begin{vmatrix} 2 & 3 & 7 \\ 13 & 17 & 5 \\ 2 & 3 & 7 \end{vmatrix}$$

As,  $R_1 = R_3$ , so value so determinant is zero.

#### 2 D. Question

Without expanding, show that the value of each of the following determinants is zero:

 $\frac{1}{a} \frac{a^2}{a^2} \frac{bc}{ac}$  $\frac{1}{b} \frac{b^2}{c^2} \frac{ac}{ab}$ 

#### Answer

Let,  $\Delta = \begin{vmatrix} 1/a & a^2 & bc \\ 1/b & b^2 & ac \\ 1/c & c^2 & ab \end{vmatrix}$ 

Multiplying R1, R2 and R3 with a, b and c respectively we get,

$$\Rightarrow \Delta = \begin{vmatrix} 1 & a^3 & abc \\ 1 & b^3 & abc \\ 1 & c^3 & abc \end{vmatrix}$$

Taking, abc common from C<sub>3</sub> gives,

$$\Rightarrow \Delta = \begin{vmatrix} 1 & a^3 & 1 \\ 1 & b^3 & 1 \\ 1 & c^3 & 1 \end{vmatrix}$$

As,  $C_1 = C_3$  hence value of determinant is zero.

### 2 E. Question

Without expanding, show that the value of each of the following determinants is zero:

```
a + b 2a + b 3a + b

2a + b 3a + b 4a + b

4a + b 5a + b 6a + b
```

### Answer

```
Let, \Delta = \begin{vmatrix} a+b & 2a+b & 3a+b\\ 2a+b & 3a+b & 4a+b\\ 4a+b & 5a+b & 6a+b \end{vmatrix}
Applying C_3 \rightarrow C_3 - C_2, we get,
\Rightarrow \Delta = \begin{vmatrix} a+b & 2a+b & a\\ 2a+b & 3a+b & a\\ 4a+b & 5a+b & a \end{vmatrix}
Applying C_2 \rightarrow C_2 - C_1 gives,
```

$$\Rightarrow \Delta = \begin{vmatrix} a+b & a & a \\ 2a+b & a & a \\ 4a+b & a & a \end{vmatrix}$$

As,  $C_2 = C_3$ , so the value of the determinant is zero.

## 2 F. Question

Without expanding, show that the value of each of the following determinants is zero:

1 a a<sup>2</sup> - bc1 b b<sup>2</sup> - ac1 c c<sup>2</sup> - ab

## Answer

Let,  $\Delta = \begin{vmatrix} 1 & a & a^2 - bc \\ 1 & b & b^2 - ac \\ 1 & c & c^2 - ab \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} - \begin{vmatrix} 1 & a & bc \\ 1 & b & ac \\ 1 & c & ab \end{vmatrix}$ 

Applying  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get,

 $\Rightarrow \Delta = \begin{vmatrix} 1 & a & a^2 \\ 0 & b-a & b^2-a^2 \\ 0 & c-a & c^2-a^2 \end{vmatrix} - \begin{vmatrix} 1 & a & bc \\ 0 & b-a & (a-b)c \\ 0 & c-a & (a-c)b \end{vmatrix}$ 

Taking (b – a) and (c – a) common from  ${\sf R}_2$  and  ${\sf R}_3$  respectively,

$$\Rightarrow \Delta = (b-a)(c-a) \begin{vmatrix} 1 & a & a^{2} \\ 0 & 1 & b+a \\ 0 & 1 & c+a \end{vmatrix} - (b-a)(c-a) \begin{vmatrix} 1 & a & bc \\ 0 & 1 & -c \\ 0 & 1 & -c \end{vmatrix}$$
$$= [(b-a)(c-a)][(c+a) - (b+a) - (-b+c)]$$
$$= [(b-a)(c-a)][c+a+b-a-b-c]$$
$$= [(b-a)(c-a)][0] = 0$$

## 2 G. Question

Without expanding, show that the value of each of the following determinants is zero:

## Answer

Let,  $\Delta = \begin{vmatrix} 49 & 1 & 6 \\ 39 & 7 & 4 \\ 26 & 2 & 3 \end{vmatrix}$ Applying,  $C_1 \rightarrow C_1 - 8C_3$ 

 $\Rightarrow \Delta = \begin{vmatrix} 1 & 1 & 6 \\ 7 & 7 & 4 \\ 2 & 2 & 3 \end{vmatrix}$ 

As,  $C_1 = C_2$  hence, the determinant is zero.

### 2 H. Question

Without expanding, show that the value of each of the following determinants is zero:

 $\begin{array}{ccc} 0 & x & y \\ -x & 0 & z \\ -y - z & 0 \end{array}$ 

### Answer

Let,  $\Delta = \begin{vmatrix} 0 & x & y \\ -x & 0 & z \\ -y & -z & 0 \end{vmatrix}$ 

Multiplying  $C_1$ ,  $C_2$  and  $C_3$  with z, y and x respectively we get,

$$\Rightarrow \Delta = \left(\frac{1}{xyz}\right) \begin{vmatrix} 0 & xy & yx \\ -xz & 0 & zx \\ -yz & -zy & 0 \end{vmatrix}$$

Now, taking y, x and z common from  $R_1$ ,  $R_2$  and  $R_3$  gives,

$$\Rightarrow \Delta = \left(\frac{1}{xyz}\right) \begin{vmatrix} 0 & x & x \\ -z & 0 & z \\ -y & -y & 0 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_3$  gives,

$$\Rightarrow \Delta = \left(\frac{1}{xyz}\right) \begin{vmatrix} 0 & x & x \\ -z & -z & z \\ -y & -y & 0 \end{vmatrix}$$

As,  $C_1 = C_2$ , therefore determinant is zero.

## 2 I. Question

Without expanding, show that the value of each of the following determinants is zero:

#### Answer

Let,  $\Delta = \begin{vmatrix} 1 & 43 & 6 \\ 7 & 35 & 4 \\ 3 & 17 & 2 \end{vmatrix}$ 

Applying  $C_2 \rightarrow C_2 - 7C_3$ , we get

$$\Rightarrow \Delta = \begin{vmatrix} 1 & 1 & 6 \\ 7 & 7 & 4 \\ 3 & 3 & 2 \end{vmatrix}$$

As,  $C_1 = C_2$ , hence determinant is zero.

## 2 J. Question

Without expanding, show that the value of each of the following determinants is zero:

#### Answer

Let,  $\Delta = \begin{bmatrix} 1^2 & 2^2 & 3^2 & 4^2 \\ 2^2 & 3^2 & 4^2 & 5^2 \\ 3^2 & 4^2 & 5^2 & 6^2 \\ 4^2 & 5^2 & 6^2 & 7^2 \end{bmatrix}$ 

Applying  $C_3 \rightarrow C_3 - C_2$ , and  $C_4 \rightarrow C_4 - C_1$ 

⇒∆ =		2 <sup>2</sup> 3 <sup>2</sup> 4 <sup>2</sup> 5 <sup>2</sup>	3 <sup>2</sup> - 4 <sup>2</sup> - 5 <sup>2</sup> - 6 <sup>2</sup> -	- 2 <sup>2</sup> - 3 <sup>2</sup> - 4 <sup>2</sup> - 5 <sup>2</sup>	$\begin{array}{c} 4^2 - 1^2 \\ 5^2 - 2^2 \\ 6^2 - 3^2 \\ 7^2 - 4^2 \end{array}$
⇒∆ =	$\begin{array}{c c} 1^2 \\ 2^2 \\ 3^2 \\ 4^2 \end{array}$	2 <sup>2</sup> 3 <sup>2</sup> 4 <sup>2</sup> 5 <sup>2</sup>	5 7 9 11	15 21 27 33	

Taking 3 common from C<sub>4</sub> we get,

$$\Rightarrow \Delta = 3 \begin{vmatrix} 1^2 & 2^2 & 5 & 5 \\ 2^2 & 3^2 & 7 & 7 \\ 3^2 & 4^2 & 9 & 9 \\ 4^2 & 5^2 & 11 & 11 \end{vmatrix}$$

As, C3 = C4 so, the determinant is zero.

#### 2 K. Question

Without expanding, show that the value of each of the following determinants is zero:

$$\begin{array}{cccc} a & b & c \\ a+2x & b+2y & c+2z \\ x & y & z \end{array}$$

#### Answer

Let, 
$$\Delta = \begin{vmatrix} a & b & c \\ a + 2x & b + 2y & c + 2z \\ x & y & z \end{vmatrix}$$

Applying,  $C_2 \rightarrow C_2 + C_1$  and  $C_3 \rightarrow C_3 + C_1$ 

$$\Rightarrow \Delta = \begin{vmatrix} a & b & c \\ 2a + 2x & 2b + 2y & 2c + 2z \\ a + x & b + y & c + z \end{vmatrix}$$

Taking 2 common from  ${\rm R}_2$  we get,

 $\Rightarrow \Delta = 2 \begin{vmatrix} a & b & c \\ a + x & b + y & c + z \\ a + x & b + y & c + z \end{vmatrix}$ 

As,  $R_2 = R_3$ , hence value of determinant is zero.

#### 2 L. Question

Without expanding, show that the value of each of the following determinants is zero:

### Answer

Let, 
$$\Delta = \begin{vmatrix} (2^{x} + 2^{-x})^{2} & (2^{x} - 2^{-x})^{2} & 1 \\ (3^{x} + 3^{-x})^{2} & (3^{x} - 3^{-x})^{2} & 1 \\ (4^{x} + 4^{-x})^{2} & (4^{x} - 4^{-x})^{2} & 1 \end{vmatrix}$$
  

$$\Rightarrow \Delta = \begin{vmatrix} 2^{2x} + 2^{-2x} + 2 & 2^{2x} + 2^{-2x} - 2 & 1 \\ 3^{2x} + 3^{-2x} + 2 & 3^{2x} + 3^{-2x} - 2 & 1 \\ 4^{2x} + 4^{-2x} + 2 & 4^{2x} + 4^{-2x} - 2 & 1 \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 - C_2$ , we get

 $\Rightarrow \Delta = \begin{vmatrix} 4 & 2^{2x} + 2^{-2x} - 2 & 1 \\ 4 & 3^{2x} + 3^{-2x} - 2 & 1 \\ 4 & 4^{2x} + 4^{-2x} - 2 & 1 \end{vmatrix}$  $\Rightarrow \Delta = 4 \begin{vmatrix} 1 & 2^{2x} + 2^{-2x} - 2 & 1 \\ 1 & 3^{2x} + 3^{-2x} - 2 & 1 \\ 1 & 4^{2x} + 4^{-2x} - 2 & 1 \end{vmatrix}$ 

As  $C_1 = C_3$  hence determinant is zero.

## 2 M. Question

Without expanding, show that the value of each of the following determinants is zero:

 $\sin \alpha \cos \alpha \cos(\alpha + \delta) \\
 \sin \beta \cos \beta \cos(\beta + \delta) \\
 \sin \gamma \cos \gamma \cos(\gamma + \delta)$ 

#### Answer

Let,  $\Delta = \begin{vmatrix} \sin \alpha & \cos \alpha & \cos(\alpha + \delta) \\ \sin \beta & \cos \beta & \cos(\beta + \delta) \\ \sin \gamma & \cos \gamma & \cos(\gamma + \delta) \end{vmatrix}$ 

Multiplying  $C_1$  with sin  $\delta,\,C_2$  with cos  $\delta,\,we$  get

$$\Rightarrow \Delta = \frac{1}{\sin \delta \cos \delta} \begin{vmatrix} \sin \alpha \sin \delta & \cos \alpha \cos \delta & \cos(\alpha + \delta) \\ \sin \beta \sin \delta & \cos \beta \cos \delta & \cos(\beta + \delta) \\ \sin \gamma \sin \delta & \cos \gamma \cos \delta & \cos(\gamma + \delta) \end{vmatrix}$$

Now, applying,  $C_2 \rightarrow C_2 - C_1$ , we get,

 $\Rightarrow \Delta = \frac{1}{\sin\delta\cos\delta} \begin{vmatrix} \sin\alpha\sin\delta & \cos\alpha\cos\delta - \sin\alpha\sin\delta & \cos(\alpha+\delta) \\ \sin\beta\sin\delta & \cos\beta\cos\delta - \sin\beta\sin\delta & \cos(\beta+\delta) \\ \sin\gamma\sin\delta & \cos\gamma\cos\delta - \sin\gamma\sin\delta & \cos(\gamma+\delta) \end{vmatrix}$  $\Rightarrow \Delta = \frac{1}{\sin\delta\cos\delta} \begin{vmatrix} \sin\alpha\sin\delta & \cos(\alpha+\delta) & \cos(\alpha+\delta) \\ \sin\beta\sin\delta & \cos(\beta+\delta) & \cos(\beta+\delta) \\ \sin\gamma\sin\delta & \cos(\gamma+\delta) & \cos(\gamma+\delta) \end{vmatrix}$ 

As  $C_2 = C_3$  hence determinant is zero.

#### 2 N. Question

Without expanding, show that the value of each of the following determinants is zero:

$$\frac{\sin^2 23^{\circ} \sin^2 67^{\circ} \cos 180^{\circ}}{-\sin^2 67^{\circ} - \sin^2 23^{\circ} \cos^2 180^{\circ}}$$
$$\cos 180^{\circ} \sin^2 23^{\circ} \sin^2 67^{\circ}$$

#### Answer

Let,  $\Delta = \begin{vmatrix} \sin^2 23^\circ & \sin^2 67^\circ & \cos 180^\circ \\ -\sin^2 67^\circ & -\sin^2 23^\circ & \cos^2 180^\circ \\ \cos 180^\circ & \sin^2 23^\circ & \sin^2 67^\circ \end{vmatrix}$ 

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

 $\Rightarrow \Delta = \begin{vmatrix} \sin^2 23^\circ + \sin^2 67^\circ & \sin^2 67^\circ & \cos 180^\circ \\ -\sin^2 67^\circ - \sin^2 23^\circ & -\sin^2 23^\circ & \cos^2 180^\circ \\ \cos 180^\circ + \sin^2 23^\circ & \sin^2 23^\circ & \sin^2 67^\circ \end{vmatrix}$ 

Using, sin(90 - A) = cos A,  $sin^2 A + cos^2 A = 1$ , and  $cos 180^\circ = -1$ ,

$$\Rightarrow \Delta = \begin{vmatrix} \sin^2 23^\circ + \cos^2 23^\circ & \sin^2 67^\circ & \cos 180^\circ \\ -(\sin^2 67^\circ + \cos^2 67^\circ) & -\sin^2 23^\circ & \cos^2 180^\circ \\ -(1 - \sin^2 23^\circ) & \sin^2 23^\circ & \sin^2 67^\circ \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & \sin^2 67^\circ & -1 \\ -1 & -\sin^2 23^\circ & 1 \\ -\cos^2 23^\circ & \sin^2 23^\circ & \cos^2 23^\circ \end{vmatrix}$$

Taking, (-1) common from C<sub>1</sub>, we get

$$\Rightarrow \Delta = - \begin{vmatrix} -1 & \sin^2 67^\circ & -1 \\ 1 & -\sin^2 23^\circ & 1 \\ \cos^2 23^\circ & \sin^2 23^\circ & \cos^2 23^\circ \end{vmatrix}$$

Therefore, as  $C_1 = C_3$  determinant is zero.

#### 2 O. Question

Without expanding, show that the value of each of the following determinants is zero:

$$\begin{array}{c} \cos(x+y) & -\sin(x+y) & \cos 2y \\ \sin x & \cos x & \sin y \\ -\cos x & \sin x & -\cos y \end{array}$$

Answer

 $\text{Let}, \Delta = \begin{vmatrix} \cos(x+y) & -\sin(x+y) & \cos 2y \\ \sin x & \cos x & \sin y \\ -\cos x & \sin x & -\cos y \end{vmatrix}$ 

Multiplying  $R_2$  with sin y and  $R_3$  with cos y we get,

 $\Rightarrow \Delta = \frac{1}{\sin y \cos y} \begin{vmatrix} \cos(x + y) & -\sin(x + y) & \cos 2y \\ \sin x \sin y & \cos x \sin y & \sin^2 y \\ -\cos x \cos y & \sin x^2 \cos y & -\cos^2 y \end{vmatrix}$ 

Now, applying  $R_2 \rightarrow R_2 + R_3$ , we get,

 $= \frac{1}{\sin y \cos y} \begin{vmatrix} \cos(x + y) & -\sin(x + y) & \cos 2y \\ \sin x \sin y - \cos x \cos y & \cos x \sin y + \sin x \cos y & \sin^2 y - \cos^2 y \\ -\cos x \cos y & \sin x \cos y & -\cos^2 y \end{vmatrix}$ 

Get More Learning Materials Here :

# 🕀 www.studentbro.in

Taking ( – 1) common from  $R_2$ , we get

$$= \frac{-1}{\sin y \cos y} \begin{vmatrix} \cos(x + y) & -\sin(x + y) & \cos 2y \\ -\sin x \sin y + \cos x \cos y & -(\cos x \sin y + \sin x \cos y) & -\sin^2 y + \cos^2 y \\ -\cos x \cos y & \sin x \cos y & -\cos^2 y \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{-1}{\sin y \cos y} \begin{vmatrix} \cos(x + y) & -\sin(x + y) & \cos 2y \\ \cos(x + y) & -\sin(x + y) & \cos 2y \\ -\cos x \cos y & \sin x \cos y & -\cos^2 y \end{vmatrix}$$

As  $R_1 = R_2$  hence determinant is zero.

#### 2 P. Question

Without expanding, show that the value of each of the following determinants is zero:

#### Answer

Let, 
$$\Delta = \begin{vmatrix} \sqrt{23} + \sqrt{3} & \sqrt{5} & \sqrt{5} \\ \sqrt{15} + \sqrt{46} & 5 & \sqrt{10} \\ 3 + \sqrt{115} & \sqrt{15} & 5 \end{vmatrix}$$

Multiplying C\_2 with  $\sqrt{3}$  and C\_3 with  $\sqrt{23}$  we get,

$$\Rightarrow \Delta = \begin{vmatrix} \sqrt{23} + \sqrt{3} & \sqrt{15} & \sqrt{115} \\ \sqrt{15} + \sqrt{46} & 5\sqrt{3} & \sqrt{230} \\ 3 + \sqrt{115} & \sqrt{45} & 5\sqrt{23} \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} \sqrt{23} + \sqrt{3} & \sqrt{5}(\sqrt{3}) & \sqrt{5}(\sqrt{23}) \\ \sqrt{15} + \sqrt{46} & \sqrt{5}(\sqrt{15}) & \sqrt{5}(\sqrt{46}) \\ 3 + \sqrt{115} & \sqrt{5}(3) & \sqrt{5}(\sqrt{115}) \end{vmatrix}$$

Taking  $\sqrt{5}$  common from  $\mathsf{C}_2$  and  $\mathsf{C}_3$  we get,

$$\Rightarrow \Delta = \sqrt{5}\sqrt{5} \begin{vmatrix} \sqrt{23} + \sqrt{3} & (\sqrt{3}) & (\sqrt{23}) \\ \sqrt{15} + \sqrt{46} & (\sqrt{15}) & (\sqrt{46}) \\ 3 + \sqrt{115} & (3) & (\sqrt{115}) \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 + C_3$ 

$$\Rightarrow \Delta = 5 \begin{vmatrix} \sqrt{23} + \sqrt{3} & \sqrt{23} + \sqrt{3} & (\sqrt{23}) \\ \sqrt{15} + \sqrt{46} & \sqrt{15} + \sqrt{46} & (\sqrt{46}) \\ 3 + \sqrt{115} & 3 + \sqrt{115} & (\sqrt{115}) \end{vmatrix}$$

As  $C_1 = C_2$  hence determinant is zero.

#### 2 Q. Question

Without expanding, show that the value of each of the following determinants is zero:

 $\sin^2 A \cot A = 1$  $\sin^2 B \cot B = 1$ , where A, B, C are the angles of  $\triangle ABC$ .  $\sin^2 C \cot C = 1$ 

### Answer

 $\label{eq:LetA} \text{Let}, \Delta \;=\; \begin{vmatrix} \sin^2 A & \cot A & 1 \\ \sin^2 B & \cot B & 1 \\ \sin^2 C & \cot C & 1 \end{vmatrix}$ 

Now,

$$\Delta = \sin^2 A (\cot B - \cot C) - \cot A (\sin^2 B - \sin^2 C) + 1 (\sin^2 B \cot C - \cot B \sin^2 C)$$

As A, B and C are angles of a triangle,

 $A + B + C = 180^{\circ}$ 

 $\Delta = \sin^2 A \cot B - \sin^2 A \cot C - \cot A \sin^2 B + \cot A \sin^2 C + \sin^2 B \cot C - \cot B \sin^2 C$ 

By using formulae,

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c} = k$$
$$\cos A = \frac{b^2 + c^2 - a^2}{2 b c}, \cos B = \frac{a^2 + c^2 - b^2}{2 a c}, \cos C = \frac{a^2 + b^2 - c^2}{2 a b}$$

$$\Delta = 0$$

Hence, Proved.

## 3. Question

Evaluate the following:

$$a \quad b + c \quad a^2$$
$$b \quad c + a \quad b^2$$
$$c \quad a + b \quad c^2$$

#### Answer

Let,  $\Delta = \begin{vmatrix} a & b + c & a^2 \\ b & c + a & b^2 \\ c & a + b & c^2 \end{vmatrix}$ 

Applying,  $C_2 \rightarrow C_2 + C_1$ 

$$\Rightarrow \Delta = \begin{vmatrix} a & b + c + a & a^2 \\ b & c + a + b & b^2 \\ c & a + b + c & c^2 \end{vmatrix}$$

Taking, (a + b + c) common,

$$\Rightarrow \Delta = (a + b + c) \begin{vmatrix} a & 1 & a^2 \\ b & 1 & b^2 \\ c & 1 & c^2 \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , and  $R_3 \rightarrow R_3 - R_1$ 

$$\Rightarrow \Delta = (a + b + c) \begin{vmatrix} a & 1 & a^{2} \\ b - a & 0 & b^{2} - a^{2} \\ c - a & 0 & c^{2} - a^{2} \end{vmatrix}$$

Taking, (b - c) and (c - a) common,

$$\Rightarrow \Delta = (a + b + c)(b - a)(c - a) \begin{vmatrix} a & 1 & a^{2} \\ 1 & 0 & b + a \\ 1 & 0 & c + a \end{vmatrix}$$
$$= (a + b + c)(b - a)(c - a)(b - c)$$

So, 
$$\Delta = (a + b + c)(b - a)(c - a)(b - c)$$

### 4. Question

Evaluate the following:

1 a bc 1 b ca 1 c ab

#### Answer

Let,  $\Delta = \begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix}$ 

Applying,  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$  we get,

$$\Rightarrow \Delta = \begin{vmatrix} 1 & a & bc \\ 0 & b-a & ca-bc \\ 0 & c-a & ab-bc \end{vmatrix}$$
$$= \begin{vmatrix} 1 & a & bc \\ 0 & b-a & c(a-b) \\ 0 & c-a & b(a-c) \end{vmatrix}$$

Taking (a - b) and (a - c) common we get,

$$\Rightarrow \Delta = (a-b)(a-c) \begin{vmatrix} 1 & a & bc \\ 0 & -1 & c \\ 0 & -1 & b \end{vmatrix}$$
  
= (a - b)(c - a)(b - c)  
So,  $\Delta = (a - b)(b - c)(c - a)$ 

## 5. Question

Evaluate the following:

$$\begin{array}{cccc} x+\lambda & x & x \\ x & x+\lambda & x \\ x & x & x+\lambda \end{array}$$

### Answer

Let,  $\Delta = \begin{vmatrix} x + \lambda & x & x \\ x & x + \lambda & x \\ x & x & x + \lambda \end{vmatrix}$ 

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ , we have,

$$\Rightarrow \Delta = \begin{vmatrix} 3x + \lambda & x & x \\ 3x + \lambda & x + \lambda & x \\ 3x + \lambda & x & x + \lambda \end{vmatrix}$$

Taking,  $(3x + \lambda)$  common, we get

$$\Rightarrow \Delta = (3x + \lambda) \begin{vmatrix} 1 & x & x \\ 1 & x + \lambda & x \\ 1 & x & x + \lambda \end{vmatrix}$$

Applying,  $R_2 \rightarrow R_2 - R_1$ ,  $R_3 \rightarrow R_3 - R_1$ , we get,

$$\Rightarrow \Delta = (3x + \lambda) \begin{vmatrix} 1 & x & x \\ 0 & \lambda & 0 \\ 0 & 0 & \lambda \end{vmatrix}$$

 $=\lambda^2(3x+\lambda)$ 

So,  $\Delta = \lambda^2 (3x + \lambda)$ 

#### 6. Question

Evaluate the following:

а b с с а b b с а

#### Answer

Let,  $\Delta = \begin{vmatrix} a & b & c \\ c & a & b \\ b & c & a \end{vmatrix}$ 

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get,

 $\Rightarrow \Delta = \begin{vmatrix} a+b+c & b & c \\ a+b+c & a & b \\ a+b+c & c & a \end{vmatrix}$ 

Taking, (a + b + c) we get,

 $\Rightarrow \Delta = (a + b + c) \begin{vmatrix} 1 & b & c \\ 1 & a & b \\ 1 & c & a \end{vmatrix}$ 

Applying,  $R_2 \rightarrow R_2 - R_1$ ,  $R_3 \rightarrow R_3 - R_1$ , we get,

$$\Rightarrow \Delta = (a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & a - b & b - c \\ 0 & c - b & a - c \end{vmatrix}$$
$$= (a + b + c)[(a - b)(a - c) - (b - c)(c - b)]$$
$$= (a + b + c)[a^{2} - ac - ab + bc + b^{2} + c^{2} - 2bc]$$
$$= (a + b + c)[a^{2} + b^{2} + c^{2} - ac - ab - bc]$$
So,  $\Delta = (a + b + c)[a^{2} + b^{2} + c^{2} - ac - ab - bc]$ 

### 7. Question

Evaluate the following:

#### Answer

Let, 
$$\Delta = \begin{vmatrix} x & 1 & 1 \\ 1 & x & 1 \\ 1 & 1 & x \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get,

$$\Rightarrow \Delta = \begin{vmatrix} 2 + x & 1 & 1 \\ 2 + x & x & 1 \\ 2 + x & 1 & x \end{vmatrix}$$
$$\Rightarrow \Delta = (2 + x) \begin{vmatrix} 1 & 1 & 1 \\ 1 & x & 1 \\ 1 & 1 & x \end{vmatrix}$$

Applying,  $R_2 \rightarrow R_2 - R_1$ ,  $R_3 \rightarrow R_3 - R_1$ , we get,

$$\Rightarrow \Delta = (2 + x) \begin{vmatrix} 1 & 1 & 1 \\ 0 & x - 1 & 0 \\ 0 & 0 & x - 1 \end{vmatrix}$$

 $= (2 + x)(x - 1)^{2}$ 

So,  $\Delta = (2 + x)(x - 1)^2$ 

## 8. Question

Evaluate the following:

$$\begin{array}{cccc} 0 & xy^2 & xz^2 \\ x^2y & 0 & yz^2 \\ x^2z & zy^2 & 0 \end{array}$$

## Answer

Let, 
$$\Delta = \begin{vmatrix} 0 & xy^2 & xz^2 \\ x^2y & 0 & yz^2 \\ x^2z & zy^2 & 0 \end{vmatrix}$$
$$= 0(0 - y^3z^3) - xy^2(0 - x^2yz^3) + xz^2(x^2y^3z - 0)$$
$$= 0 + x^3y^3z^3 + x^3y^3z^3$$
$$= 2x^3y^3z^3$$
So, 
$$\Delta = 2x^3y^3z^3$$

## 9. Question

Evaluate the following:

 $\begin{array}{cccc} 1+x & y & z \\ x & a+y & z \\ x & y & a+z \end{array}$ 

## Answer

Let,  $\Delta = \begin{vmatrix} a + x & y & z \\ x & a + y & z \\ x & y & a + z \end{vmatrix}$ 

Applying  $R_1 \rightarrow R_1 - R_2$  and  $R_3 \rightarrow R_3 - R_2$ 

$$\Rightarrow \Delta = \begin{vmatrix} a & -a & 0 \\ x & a + y & z \\ 0 & -a & a \end{vmatrix}$$
  
Applying,  $C_2 \rightarrow C_2 - C_1$   
$$\Rightarrow \Delta = \begin{vmatrix} a & 0 & 0 \\ x & a + x + y & z \\ 0 & -a & a \end{vmatrix}$$
  
$$= a[a(a + x + y) + az] + 0 + 0$$
  
$$= a^2(a + x + y + z)$$
  
So,  $\Delta = a^2(a + x + y + z)$   
**10. Question**

If 
$$\Delta = \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix}$$
,  $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ yz & zx & xy \\ x & y & z \end{vmatrix}$ , then prove that  $\Delta + \Delta_1 = 0$ .

Answer

Let, 
$$\Delta = \begin{vmatrix} 1 & x & x^{2} \\ 1 & y & y^{2} \\ 1 & z & z^{2} \end{vmatrix} + \begin{vmatrix} 1 & 1 & 1 \\ yz & zx & xy \\ x & y & z \end{vmatrix}$$
  
As  $|A| = |A|^{T}$   
 $\Rightarrow \Delta = \begin{vmatrix} 1 & x & x^{2} \\ 1 & y & y^{2} \\ 1 & z & z^{2} \end{vmatrix} + \begin{vmatrix} 1 & yz & x \\ 1 & zx & y \\ 1 & xy & z \end{vmatrix}$ 

If any two rows or columns of the determinant are interchanged, then determinant changes its sign

$$\Rightarrow \Delta = \begin{vmatrix} 1 & x & x^{2} \\ 1 & y & y^{2} \\ 1 & z & z^{2} \end{vmatrix} - \begin{vmatrix} 1 & x & yz \\ 1 & y & zx \\ 1 & z & xy \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 0 & 0 & x^{2} - yz \\ 0 & 0 & y^{2} - zx \\ 0 & 0 & z^{2} - xy \end{vmatrix} = 0$$

So,  $\Delta = 0$ 

## 11. Question

Prove the following identities:

 $\begin{vmatrix} a & b & c \\ a - b & b - c & c - a \\ b + c & c + a & a + b \end{vmatrix} = a^3 + b^3 + c^3 - 3abc$ 

#### Answer

$$\begin{vmatrix} a & b & c \\ a-b & b-c & c-a \\ b+c & c+a & a+b \end{vmatrix}$$
  
L.H.S = 
$$\begin{vmatrix} a & b & c \\ a-b & b-c & c-a \\ b+c & c+a & a+b \end{vmatrix}$$

Apply  $C_1 \rightarrow C_1 + C_2 + C_3$ 

 $= \begin{vmatrix} a + b + c & b & c \\ 0 & b - c & c - a \\ 2(a + b + c) & c + a & a + b \end{vmatrix}$ 

Taking (a + b + c) common from C<sub>1</sub> we get,

 $= (a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & b - c & c - a \\ 2 & c + a & a + b \end{vmatrix}$ 

Applying,  $R_3 \rightarrow R_3 - 2R_1$ 

$$= (a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & b - c & c - a \\ 0 & c + a - 2b & a + b - 2c \end{vmatrix}$$

= (a + b + c)[(b - c)(a + b - 2c) - (c - a)(c + a - 2b)]

 $= a^3 + b^3 + c^3 - 3abc$ 

As, L.H.S = R.H.S

Hence, proved.

#### 12. Question

Prove the following identities:

$$\begin{vmatrix} b + c & a - b & a \\ c + a & b - c & b \\ a + b & c - a & c \end{vmatrix} = 3abc - a^3 - b^3 - c^3$$

#### Answer

L.H.S =  $\begin{vmatrix} b + c & a - b & a \\ c + a & b - c & b \\ a + b & c - a & c \end{vmatrix}$ As  $|A| = |A|^T$ So,  $\begin{vmatrix} b + c & c + a & a + b \\ a - b & b - c & c - a \\ a & b & c \end{vmatrix}$ 

If any two rows or columns of the determinant are interchanged, then determinant changes its sign

 $\begin{array}{c|cccc} a & b & c \\ a - b & b - c & c - a \\ b + c & c + a & a + b \end{array} \\ \end{array} \\ \mbox{Apply } C_1 \rightarrow C_1 + C_2 + C_3 \\ = - \begin{vmatrix} a + b + c & b & c \\ 0 & b - c & c - a \\ 2(a + b + c) & c + a & a + b \end{vmatrix} \\ \mbox{Taking } (a + b + c) \ common \ from \ C_1 \ we \ get, \end{cases}$ 

 $= -(a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & b - c & c - a \\ 2 & c + a & a + b \end{vmatrix}$ Applying, R<sub>3</sub>→R<sub>3</sub> - 2R<sub>1</sub>

$$= -(a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & b - c & c - a \\ 0 & c + a - 2b & a + b - 2c \end{vmatrix}$$
$$= -(a + b + c)[(b - c)(a + b - 2c) - (c - a)(c + a - 2b)]$$
$$= 3abc - a^{3} - b^{3} - c^{3}$$

As, L.H.S = R.H.S, hence proved.

#### 13. Question

Prove the following identities:

 $\begin{vmatrix} a+b & b+c & c+a \\ b+c & c+a & a+b \\ c+a & a+b & b+c \end{vmatrix} = 2 \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ 

#### Answer

$\begin{array}{c} a+b & b+c \\ b+c & c+a \\ c+a & a+b \end{array}$	$\begin{vmatrix} c + a \\ a + b \\ b + c \end{vmatrix} = 2 \begin{vmatrix} a \\ b \\ c \end{vmatrix}$	b c a	c a b
L.H.S = $\begin{vmatrix} a + b \\ b + c \\ c + a \end{vmatrix}$	b + c  c + a c + a  a + b a + b  b + c		

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ 

=	2(a + b + c)	b + c	c + a
	2(a + b + c)	c + a	a + b
	2(a + b + c)	a + b	b + c
=	$ \begin{array}{c} (a + b + c) \\ (a + b + c) \\ (a + b + c) \end{array} $	b + c c + a a + b	c + a a + b b + c

Apply,  $C_2 \rightarrow C_2 - C_1$ , and  $C_3 \rightarrow C_3 - C_1$ , we have

```
= 2 \begin{vmatrix} (a + b + c) & -a & -b \\ (a + b + c) & -b & -c \\ (a + b + c) & -c & -a \end{vmatrix}= 2 \begin{vmatrix} (a + b + c) & a & b \\ (a + b + c) & b & c \\ (a + b + c) & c & a \end{vmatrix}= 2 \left( \begin{vmatrix} c & a & b \\ a & b & c \\ b & c & a \end{vmatrix} + \begin{vmatrix} a & a & b \\ b & b & c \\ c & c & a \end{vmatrix} + \begin{vmatrix} b & a & b \\ c & b & c \\ a & c & a \end{vmatrix} \right)= 2 \begin{vmatrix} c & a & b \\ a & b & c \\ b & c & a \end{vmatrix}= 2 \begin{vmatrix} c & a & b \\ a & b & c \\ b & c & a \end{vmatrix}= R.H.S
```

Hence, proved.

#### 14. Question

Prove the following identities:

# Get More Learning Materials Here :

CLICK HERE

🕀 www.studentbro.in

$$\begin{vmatrix} a + b + 2c & a & b \\ c & b + c + 2a & b \\ c & a & c + a + 2b \end{vmatrix} = 2(a + b + c)^3$$

#### Answer

L.H.S =  $\begin{vmatrix} a + b + 2c & a & b \\ c & b + c + 2a & b \\ c & a & c + a + 2b \end{vmatrix}$ ,

 $R.H.S = 2(a + b + c)^2$ 

Applying  $C_1 \rightarrow C_1 + C_2 + C_3$ , we have

 $= \begin{vmatrix} 2(a + b + c) & a & b \\ 2(a + b + c) & b + c + 2a & b \\ 2(a + b + c) & a & c + a + 2b \end{vmatrix}$ 

Taking, 2(a + b + c) common we get,

$$= 2(a + b + C) \begin{vmatrix} 1 & a & b \\ 1 & b + c + 2a & b \\ 1 & a & c + a + 2b \end{vmatrix}$$

Now, applying  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get,

$$= 2(a + b + C) \begin{vmatrix} 1 & a & b \\ 0 & b + c + a & 0 \\ 0 & 0 & c + a + b \end{vmatrix}$$

Thus, we have

L.H.S =  $2(a + b + c)[1(a + b + c)^{2}]$ 

 $= 2(a + b + c)^3 = R.H.S$ 

Hence, proved.

#### 15. Question

Prove the following identities:

$$\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} = (a+b+c)^3$$

#### Answer

L.H.S = 
$$\begin{vmatrix} a - b - c & 2a & 2a \\ 2b & b - c - a & 2b \\ 2c & 2c & c - a - b \end{vmatrix}$$

Applying,  $R_1 \rightarrow R_1 + R_2 + R_3$ , we get,

$$= \begin{vmatrix} a + b + c & a + b + c & a + b + c \\ 2b & b - c - a & 2b \\ 2c & 2c & c - a - b \end{vmatrix}$$

Taking (a + b + c) common we get,

$$= (a + b + c) \begin{vmatrix} 1 & 1 & 1 \\ 2b & b - c - a & 2b \\ 2c & 2c & c - a - b \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$  and  $C_3 \rightarrow C_3 - C_1$ , we get,

$$= (a + b + c) \begin{vmatrix} 1 & 0 & 0 \\ 2b & -b - c - a & 0 \\ 2c & 0 & -c - a - b \end{vmatrix}$$
$$= (a + b + c) \begin{vmatrix} 1 & 0 & 0 \\ 2b & b + c + a & 0 \\ 2c & 0 & b + c + a \end{vmatrix}$$

 $= (a + b + c)^3 = R.H.S$ 

Hence, proved.

### 16. Question

Prove the following identities:

$$\begin{vmatrix} 1 & b+c & b^{2}+c^{2} \\ 1 & c+a & c^{2}+a^{2} \\ 1 & a+b & a^{2}+b^{2} \end{vmatrix} = (a-b)(b-c)(c-a)$$

#### Answer

L.H.S =  $\begin{vmatrix} 1 & b + c & b^2 + c^2 \\ 1 & c + a & c^2 + a^2 \\ 1 & a + b & a^2 + b^2 \end{vmatrix}$ 

Applying,  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get,

$$= \begin{vmatrix} 1 & b + c & b^{2} + c^{2} \\ 0 & a - b & a^{2} - b^{2} \\ 0 & a - c & a^{2} - c^{2} \end{vmatrix}$$
$$= (a - b)(a - c) \begin{vmatrix} 1 & b + c & b^{2} + c^{2} \\ 0 & 1 & a + b \\ 0 & 1 & a + c \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_2$ , we get,

$$= (a-b)(a-c) \begin{vmatrix} 1 & b+c & b^2+c^2 \\ 0 & 1 & a+b \\ 0 & 0 & c-a \end{vmatrix}$$

$$= (a - b)(a - c)(b - c) = R.H.S$$

Hence, proved.

### 17. Question

Prove the following identities:

 $\begin{vmatrix} a & a+b & a+2b \\ a+2b & a & a+b \\ a+b & a+2b & a \end{vmatrix} = 9(a+b)b^2$ 

### Answer

L.H.S =  $\begin{vmatrix} a & a+b & a+2b \\ a+2b & a & a+b \\ a+b & a+2b & a \end{vmatrix}$ 

Applying  $R_1 \rightarrow R_1 + R_2 + R_3$ , we get,

$$= \begin{vmatrix} 3a + 3b & 3a + 3b & 3a + 3b \\ a + 2b & a & a + b \\ a + b & a + 2b & a \end{vmatrix}$$

Taking, (3a + 2b) common we get,

$$= (3a + 3b) \begin{vmatrix} 1 & 1 & 1 \\ a + 2b & a & a + b \\ a + b & a + 2b & a \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 - C_2$  and  $C_3 \rightarrow C_3 - C_2$ , we get,

$$= (3a + 3b) \begin{vmatrix} 0 & 1 & 0 \\ 2b & a & b \\ -b & a + 2b & -2b \end{vmatrix}$$
$$= (3a + 3b)b^{2} \begin{vmatrix} 0 & 1 & 0 \\ 2 & a & 1 \\ -1 & a + 2b & -2 \end{vmatrix}$$
$$= 3(a + b)b^{2}(3) = 9(a + b)b^{2}$$
$$= R.H.S$$

Hence, proved.

#### 18. Question

Prove the following identities:

 $\begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix} = \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix}$ 

#### Answer

 $L.H.S = \begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix}$ 

Applying,  $R_1 \rightarrow a R_1$ ,  $R_2 \rightarrow b R_2$ ,  $R_3 \rightarrow c R_3$ 

$$= \left(\frac{1}{abc}\right) \begin{vmatrix} a & a^2 & abc \\ b & b^2 & cab \\ c & c^2 & abc \end{vmatrix}$$
$$= \left(\frac{abc}{abc}\right) \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix}$$
$$= - \begin{vmatrix} a & 1 & a^2 \\ b & 1 & b^2 \\ c & 1 & c^2 \end{vmatrix}$$
$$= \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix}$$

Hence, proved.

### 19. Question

Prove the following identities:

Get More Learning Materials Here : 📕

CLICK HERE

$$\begin{vmatrix} z & x & y \\ z^2 & x^2 & y^2 \\ z^4 & x^4 & y^4 \end{vmatrix} = \begin{vmatrix} x & y & z \\ x^2 & y^2 & z^2 \\ x^4 & y^4 & z^4 \end{vmatrix} = \begin{vmatrix} x^2 & y^2 & z^2 \\ x^4 & y^4 & z^4 \\ x & y & z \end{vmatrix} = xyz(x-y)(y-z)(z-x)(x+y+z)$$

## Answer

$$\begin{vmatrix} z & x & y \\ z^{2} & x^{2} & y^{2} \\ z^{4} & x^{4} & y^{4} \end{vmatrix} = \begin{vmatrix} x & y & z \\ x^{2} & y^{2} & z^{2} \\ x^{4} & y^{4} & z^{4} \end{vmatrix} = \begin{vmatrix} x^{2} & y^{2} & z^{2} \\ x^{4} & y^{4} & z^{4} \\ x & y & z \end{vmatrix}$$
$$= xyz(x - y)(y - z)(z - x)(x + y + z)$$
$$\begin{vmatrix} x & y & z \\ x^{2} & y^{2} & z^{2} \\ x^{4} & y^{4} & z^{4} \end{vmatrix}$$
$$= xyz \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^{3} & y^{3} & z^{3} \end{vmatrix}$$
$$= xyz \begin{vmatrix} 0 & 1 & 0 \\ x - y & y & z - y \\ x^{3} - y^{3} & y^{3} & z^{3} - y^{3} \end{vmatrix}$$
$$= xyz(x - y)(z - y) \begin{vmatrix} 0 & 1 & 0 \\ 1 & y & 1 \\ x^{2} + y^{2} + xy & y^{3} & z^{2} + y^{2} + zy \end{vmatrix}$$
$$= -xyz(x - y)(z - y)[z^{2} + y^{2} + zy - x^{2} - y^{2} - xy]$$
$$= -xyz(x - y)(z - y)[(z - x)(x + y + z)]$$
$$= R.H.S$$

Hence, proved.

## 20. Question

Prove the following identities:

$$(b-c)(c-a)(a+b+c)(a^2+b^2+c^2)$$

## Answer

$$L.H.S = \begin{vmatrix} (b+c)^2 & a^2 & bc \\ (c+a)^2 & b^2 & ca \\ (a+b)^2 & c^2 & ab \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 + C_2 - 2C_3$ 

$$= \begin{vmatrix} (b+c)^2 - a^2 - 2bc & a^2 & bc \\ (c+a)^2 - b^2 - 2ca & b^2 & ca \\ (a+b)^2 - c^2 - 2ab & c^2 & ab \end{vmatrix}$$

$$= \begin{vmatrix} a^2 + b^2 + c^2 & a^2 & bc \\ a^2 + b^2 + c^2 & b^2 & ca \\ a^2 + b^2 + c^2 & c^2 & ab \end{vmatrix}$$

Taking  $(a^2 + b^2 + c^2)$ , common, we get,

 $= (a^{2} + b^{2} + c^{2}) \begin{vmatrix} 1 & a^{2} & bc \\ 1 & b^{2} & ca \\ 1 & c^{2} & ab \end{vmatrix}$ 

Applying  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get,

$$= (a^{2} + b^{2} + c^{2}) \begin{vmatrix} 1 & a^{2} & bc \\ 0 & b^{2} - a^{2} & ca - bc \\ 0 & c^{2} - a^{2} & ab - bc \end{vmatrix}$$
  
$$= (a^{2} + b^{2} + c^{2})(b - a)(c - a) \begin{vmatrix} 1 & a^{2} & bc \\ 0 & b + a & -c \\ 0 & c + a & -b \end{vmatrix}$$
  
$$= (a^{2} + b^{2} + c^{2})(b - a)(c - a)[(b + a)(-b) - (-c)(c + a)]$$
  
$$= (a^{2} + b^{2} + c^{2})(a - b)(c - a)(b - c)(a + b + c)$$
  
$$= R.H.S$$

Hence, proved.

#### 21. Question

Prove the following identities:

$$\begin{array}{cccc} (b+1)(a+2) & a+2 & 1 \\ (a+2)(a+3) & a+3 & 1 \\ (a+3)(a+4) & a+4 & 1 \end{array} = -2$$

#### Answer

 $L.H.S = \begin{vmatrix} (a+1)(a+2) & a+2 & 1 \\ (a+2)(a+3) & a+3 & 1 \\ (a+3)(a+4) & a+4 & 1 \end{vmatrix}$ 

Applying,  $R_3 \rightarrow R_3 - R_2$ 

$$= \begin{vmatrix} (a+1)(a+2) & a+2 & 1 \\ (a+2)(a+3) & a+3 & 1 \\ (a+3)2 & 1 & 0 \end{vmatrix}$$

Applying,  $R_2 \rightarrow R_2 - R_1$ 

$$= \begin{vmatrix} (a+1)(a+2) & a+2 & 1 \\ (a+2)2 & 1 & 0 \\ (a+3)2 & 1 & 0 \end{vmatrix}$$
$$= [(2a+4)(1) - (1)(2a+6)]$$
$$= -2$$
$$= R.H.S$$
Hence, proved.

#### 22. Question

Prove the following identities:

$$\begin{vmatrix} a^{2} & a^{2} - (b - c)^{2} & bc \\ b^{2} & b^{2} - (c - a)^{2} & ca \\ c^{2} & c^{2} - (a - b)^{2} & ab \end{vmatrix} = (a - b)(b - c)(c - a)(a + b + c)(a^{2} + b^{2} + c^{2})$$

## Answer

L.H.S = 
$$\begin{vmatrix} a^2 & a^2 - (b - c)^2 & bc \\ b^2 & b^2 - (c - a)^2 & ca \\ c^2 & c - (a - b)^2 & ab \end{vmatrix}$$

Applying,  $C_2 \rightarrow C_2 - 2C_1 - 2C_3$ , we get,

$$= \begin{vmatrix} a^2 & a^2 - (b-c)^2 - 2a^2 - 2bc & bc \\ b^2 & b^2 - (c-a)^2 a^2 - (b-c)^2 - 2b^2 - 2ca & ca \\ c^2 & c - (a-b)^2 a^2 - (b-c)^2 - 2c^2 - 2ab & ab \end{vmatrix}$$
$$= \begin{vmatrix} a^2 & -(a^2 + b^2 + c^2) & bc \\ b^2 & -(a^2 + b^2 + c^2) & ca \\ c^2 & -(a^2 + b^2 + c^2) & ab \end{vmatrix}$$

Taking, –  $(a^2 + b^2 + c^2)$  common from C<sub>2</sub> we get,

$$= -(a^{2} + b^{2} + c^{2}) \begin{vmatrix} a^{2} & 1 & bc \\ b^{2} & 1 & ca \\ c^{2} & 1 & ab \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get

$$= -(a^{2} + b^{2} + c^{2}) \begin{vmatrix} a^{2} & 1 & bc \\ b^{2} - a^{2} & 0 & ca - bc \\ c^{2} - a^{2} & 0 & ab - bc \end{vmatrix}$$

$$= -(a^{2} + b^{2} + c^{2})(a - b)(c - a) \begin{vmatrix} a^{2} & 1 & bc \\ -(b + a) & 0 & c \\ c + a & 0 & -b \end{vmatrix}$$

$$= -(a^{2} + b^{2} + c^{2})(a - b)(c - a)[(-(b + a))(-b) - (c)(c + a)]$$

$$= (a - b)(b - c)(c - a)(a + b + c)(a^{2} + b^{2} + c^{2})$$

$$= R.H.S$$

Hence, proved.

## 23. Question

Prove the following identities:

$$\begin{vmatrix} 1 & a^{2} + bc & a^{3} \\ 1 & b^{2} + ca & b^{3} \\ 1 & c^{2} + ab & c^{3} \end{vmatrix} = -(a - b)$$

$$(b-c)(c-a)(a^2+b^2+c^2)$$

## Answer

$$L.H.S = \begin{vmatrix} 1 & a^2 + bc & a^3 \\ 1 & b^2 + ca & b^3 \\ 1 & c^2 + ab & c^3 \end{vmatrix}$$

Applying,  $R_2 \rightarrow R_2 - R_1$ , and  $R_3 \rightarrow R_3 - R_1$ 

 $= \begin{vmatrix} 1 & a^{2} + bc & a^{3} \\ 0 & b^{2} + ca - a^{2} - bc & b^{3} - a^{3} \\ 0 & c^{2} + ab - a^{2} - bc & c^{3} - a^{3} \end{vmatrix}$   $= \begin{vmatrix} 1 & a^{2} + bc & a^{3} \\ 0 & b^{2} - a^{2} - c(b - a) & b^{3} - a^{3} \\ 0 & c^{2} - a^{2} + b(c - a) & c^{3} - a^{3} \end{vmatrix}$   $= (b - a)(c - a) \begin{vmatrix} 1 & a^{2} + bc & a^{3} \\ 0 & b + a - c & b^{2} + a^{2} + ab \\ 0 & c + a + b & c^{2} + a^{2} + ac \end{vmatrix}$   $= (b - a)(c - a)[((b + a - c))(c^{2} + a^{2} + ac) - (b^{2} + a^{2} + ab)(c^{2} + a^{2} + ac)]$   $= - (a - b)(c - a)(b - c)(a^{2} + b^{2} + c^{2})$  = R.H.SHence, proved.

## 24. Question

Prove the following identities:

$$\begin{vmatrix} a^{2} & bc & ac + c^{2} \\ a^{2} + ab & b^{2} & ac \\ ab & b^{2} + bc & c^{2} \end{vmatrix} = 4a^{2}b^{2}c^{2}$$

#### Answer

$$L.H.S = \begin{vmatrix} a^2 & bc & ac + c^2 \\ a^2 + ab & b^2 & ac \\ ab & b^2 + bc & c^2 \end{vmatrix}$$

Taking, a,b,c common from C<sub>1</sub>, C<sub>2</sub>, C<sub>3</sub> respectively we get,

$$= abc \begin{vmatrix} a & c & a+c \\ a+b & b & a \\ b & b+c & c \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get,

$$= abc \begin{vmatrix} 2(a+c) & c & a+c \\ 2(a+b) & b & a \\ 2(b+c) & b+c & c \end{vmatrix}$$
$$= 2abc \begin{vmatrix} (a+c) & c & a+c \\ (a+b) & b & a \\ (b+c) & b+c & c \end{vmatrix}$$

Applying,  $C_2 \rightarrow C_2 - C_1$  and  $C_3 \rightarrow C_3 - C_1$ , we get,

$$= 2abc \begin{vmatrix} (a+c) & -a & 0 \\ (a+b) & -a & -b \\ (b+c) & 0 & -b \end{vmatrix}$$

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get,

$$= 2abc \begin{vmatrix} c & -a & 0 \\ 0 & -a & -b \\ c & 0 & -b \end{vmatrix}$$

Taking c, a, b common from  $C_1$ ,  $C_2$ ,  $C_3$  respectively, we get,

$$= 2a^{2}b^{2}c^{2}\begin{vmatrix} 1 & -1 & 0 \\ 0 & -1 & -1 \\ 1 & 0 & -1 \end{vmatrix}$$

Applying,  $R_3 \rightarrow R_3 - R_1$ , we have

$$= 2a^{2}b^{2}c^{2} \begin{vmatrix} 1 & -1 & 0 \\ 0 & -1 & -1 \\ 0 & 1 & -1 \end{vmatrix}$$
$$= 2a^{2}b^{2}c^{2}(2)$$
$$= 4a^{2}b^{2}c^{2} = R.H.S$$

Hence, proved.

## 25. Question

Prove the following identities:

$$\begin{vmatrix} x + 4 & x & x \\ x & x + 4 & x \\ x & x & x + 4 \end{vmatrix} = 16(3x + 4)$$

## Answer

L.H.S =	x + 4	х	x
L.H.S =	х	x + 4	x
	x	х	x + 4

Applying,  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get,

 $= \begin{vmatrix} 3x + 4 & x & x \\ 3x + 4 & x + 4 & x \\ 3x + 4 & x & x + 4 \end{vmatrix}$ 

Taking (3x + 4) common we get,

$$= (3x + 4) \begin{vmatrix} 1 & x & x \\ 1 & x + 4 & x \\ 1 & x & x + 4 \end{vmatrix}$$

Applying,  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get,

$$= (3x + 4) \begin{vmatrix} 1 & x & x \\ 0 & 4 & 0 \\ 0 & 0 & 4 \end{vmatrix}$$

= 16(3x + 4)

Hence proved.

## 26. Question

Prove the following identities -

$$\begin{vmatrix} 1 & 1+p & 1+p+q \\ 2 & 3+2p & 4+3p+2q \\ 3 & 3+3p & 10+6p+3q \end{vmatrix} = 1$$

## Answer

Let 
$$\Delta = \begin{vmatrix} 1 & 1+p & 1+p+q \\ 2 & 3+2p & 4+3p+2q \\ 3 & 6+3p & 10+6p+3q \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_i$  or  $C_i \rightarrow C_i + kC_i$ .

Applying  $C_2 \rightarrow C_2 - pC_1$ , we get

 $\Delta = \begin{vmatrix} 1 & 1+p-p(1) & 1+p+q \\ 2 & 3+2p-p(2) & 4+3p+2q \\ 3 & 6+3p-p(3) & 10+6p+3q \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 1 & 1 & 1+p+q \\ 2 & 3 & 4+3p+2q \\ 3 & 6 & 10+6p+3q \end{vmatrix}$ Applying C<sub>3</sub>  $\rightarrow$  C<sub>3</sub> - qC<sub>1</sub>, we get

 $\Delta = \begin{vmatrix} 1 & 1 & 1 + p + q - q(1) \\ 2 & 3 & 4 + 3p + 2q - q(2) \\ 3 & 6 & 10 + 6p + 3q - q(3) \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 1 & 1 & 1 + p \\ 2 & 3 & 4 + 3p \\ 3 & 6 & 10 + 6p \end{vmatrix}$ 

Applying  $C_3 \rightarrow C_3 - pC_2$ , we get

 $\Delta = \begin{vmatrix} 1 & 1 & 1 + p - p(1) \\ 2 & 3 & 4 + 3p - p(3) \\ 3 & 6 & 10 + 6p - p(6) \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 1 & 1 & 1 \\ 2 & 3 & 4 \\ 3 & 6 & 10 \end{vmatrix}$ 

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = \begin{vmatrix} 1 & 1 - 1 & 1 \\ 2 & 3 - 2 & 4 \\ 3 & 6 - 3 & 10 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & 0 & 1 \\ 2 & 1 & 4 \\ 3 & 3 & 10 \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = \begin{vmatrix} 1 & 0 & 1 - 1 \\ 2 & 1 & 4 - 2 \\ 3 & 3 & 10 - 3 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & 0 & 0 \\ 2 & 1 & 2 \\ 3 & 3 & 7 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

```
\Delta = 1[(1)(7) - (3)(2)] - 0 + 0

\therefore \Delta = 7 - 6 = 1

Thus, \begin{vmatrix} 1 & 1+p & 1+p+q \\ 2 & 3+2p & 4+3p+2q \\ 3 & 6+3p & 10+6p+3q \end{vmatrix} = 1
```

27. Question

Prove the following identities -

 $\begin{vmatrix} a & b-c & c-b \\ a-c & b & c-a \\ a-b & b-a & c \end{vmatrix} = (a + b - c)(b + c - a)(c + a - b)$ 

## Answer

Let  $\Delta = \begin{vmatrix} a & b-c & c-b \\ a-c & b & c-a \\ a-b & b-a & c \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_i$  or  $C_i \rightarrow C_i + kC_i$ .

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = \begin{vmatrix} a - (a - c) & b - c - (b) & c - b - (c - a) \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} c & -c & a - b \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 - R_3$ , we get

$$\Delta = \begin{vmatrix} c - (a-b) & -c - (b-a) & a - b - (c) \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} -a + b + c & a - b - c & a - b - c \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} -(a - b - c) & a - b - c & a - b - c \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix}$$

Taking the term (a – b – c) common from  $R_1$ , we get

$$\Delta = (a - b - c) \begin{vmatrix} -1 & 1 & 1 \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 + C_1$ , we get

$$\Delta = (a - b - c) \begin{vmatrix} -1 & 1 + (-1) & 1 \\ a - c & b + (a - c) & c - a \\ a - b & b - a + (a - b) & c \end{vmatrix}$$
$$\Rightarrow \Delta = (a - b - c) \begin{vmatrix} -1 & 0 & 1 \\ a - c & b + a - c & c - a \\ a - b & 0 & c \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 + C_1$ , we get

$$\Delta = (a-b-c) \begin{vmatrix} -1 & 0 & 1+(-1) \\ a-c & b+a-c & c-a+(a-c) \\ a-b & 0 & c+(a-b) \end{vmatrix}$$
$$\Rightarrow \Delta = (a-b-c) \begin{vmatrix} -1 & 0 & 0 \\ a-c & b+a-c & 0 \\ a-b & 0 & c+a-b \end{vmatrix}$$

Expanding the determinant along  $R_1$ , we have

$$\Delta = (a - b - c)[-1(b + a - c)(c + a - b) - 0 + 0]$$
  

$$\Rightarrow \Delta = -(a - b - c)(b + a - c)(c + a - b)$$
  

$$\therefore \Delta = (b + c - a)(a + b - c)(c + a - b)$$
  
Thus,  $\begin{vmatrix} a & b - c & c - b \\ a - c & b & c - a \\ a - b & b - a & c \end{vmatrix} = (a + b - c)(b + c - a)(c + a - b)$ 

#### 28. Question

Prove the following identities -

$$\begin{vmatrix} a^{2} & 2ab & b^{2} \\ b^{2} & a^{2} & 2ab \\ 2ab & b^{2} & a^{2} \end{vmatrix} = (a^{3} + b^{3})^{2}$$

#### Answer

 $\text{Let } \Delta = \begin{vmatrix} a^2 & 2ab & b^2 \\ b^2 & a^2 & 2ab \\ 2ab & b^2 & a^2 \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} a^2 + b^2 & 2ab + a^2 & b^2 + 2ab \\ b^2 & a^2 & 2ab \\ 2ab & b^2 & a^2 \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} a^2 + b^2 + 2ab & 2ab + a^2 + b^2 & b^2 + 2ab + a^2 \\ b^2 & a^2 & 2ab \\ 2ab & b^2 & a^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a^2 + b^2 + 2ab & a^2 + b^2 + 2ab \\ b^2 & a^2 & 2ab \\ 2ab & b^2 & a^2 \end{vmatrix}$$

Taking the term ( $a^2 + b^2 + 2ab$ ) common from R<sub>1</sub>, we get

$$\Delta = (a^{2} + b^{2} + 2ab) \begin{vmatrix} 1 & 1 & 1 \\ b^{2} & a^{2} & 2ab \\ 2ab & b^{2} & a^{2} \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = (a+b)^2 \begin{vmatrix} 1 & 1-1 & 1 \\ b^2 & a^2-b^2 & 2ab \\ 2ab & b^2-2ab & a^2 \end{vmatrix}$$

$$\Rightarrow \Delta = (a+b)^2 \begin{vmatrix} 1 & 0 & 1 \\ b^2 & a^2 - b^2 & 2ab \\ 2ab & b^2 - 2ab & a^2 \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (a+b)^2 \begin{vmatrix} 1 & 0 & 1-1 \\ b^2 & a^2 - b^2 & 2ab - b^2 \\ 2ab & b^2 - 2ab & a^2 - 2ab \end{vmatrix}$$

$$\Rightarrow \Delta = (a+b)^2 \begin{vmatrix} 1 & 0 & 0 \\ b^2 & a^2 - b^2 & 2ab - b^2 \\ 2ab & b^2 - 2ab & a^2 - 2ab \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = (a + b)^{2} [(a^{2} - b^{2})(a^{2} - 2ab) - (b^{2} - 2ab)(2ab - b^{2})]$$

$$\Rightarrow \Delta = (a + b)^{2} [a^{4} - 2a^{3}b - b^{2}a^{2} + 2ab^{3} - 2ab^{3} + b^{4} + 4a^{2}b^{2} - 2ab^{3}]$$

$$\Rightarrow \Delta = (a + b)^{2} [a^{4} - 2a^{3}b + 3a^{2}b^{2} - 2ab^{3} + b^{4}]$$

$$\Rightarrow \Delta = (a + b)^{2} [a^{4} + b^{4} + 2a^{2}b^{2} - 2a^{3}b - 2ab^{3} + a^{2}b^{2}]$$

$$\Rightarrow \Delta = (a + b)^{2} [(a^{2} + b^{2})^{2} - 2ab(a^{2} + b^{2}) + (ab)^{2}]$$

$$\Rightarrow \Delta = (a + b)^{2} [(a^{2} + b^{2} - ab)^{2}]$$

$$\Rightarrow \Delta = [(a + b)(a^{2} + b^{2} - ab)]^{2}$$

$$\therefore \Delta = (a^{3} + b^{3})^{2}$$
Thus,
$$\begin{vmatrix} a^{2} & 2ab & b^{2} \\ b^{2} & a^{2} & 2ab \\ 2ab & b^{2} & a^{2} \end{vmatrix} = (a^{3} + b^{3})^{2}$$

## 29. Question

Prove the following identities -

$$\begin{vmatrix} a^{2} + 1 & ab & ac \\ ab & b^{2} + 1 & bc \\ ca & cb & c^{2} + 1 \end{vmatrix} = 1 + a^{2} + b^{2} + c^{2}$$

#### Answer

Let 
$$\Delta = \begin{vmatrix} a^2 + 1 & ab & ac \\ ab & b^2 + 1 & bc \\ ca & cb & c^2 + 1 \end{vmatrix}$$
  
 $\Rightarrow \Delta = \begin{vmatrix} a\left(a + \frac{1}{a}\right) & ab & ac \\ ab & b\left(b + \frac{1}{b}\right) & bc \\ ca & cb & c\left(c + \frac{1}{c}\right) \end{vmatrix}$ 

Taking a, b and c common from  $C_1$ ,  $C_2$  and  $C_3$ , we get

 $\Rightarrow \Delta = (abc) \begin{vmatrix} a + \frac{1}{a} & a & a \\ b & b + \frac{1}{b} & b \\ c & c & c + \frac{1}{c} \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ . Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = (abc) \begin{vmatrix} a + \frac{1}{a} & a - \left(a + \frac{1}{a}\right) & a \\ b & b + \frac{1}{b} - b & b \\ c & c - c & c + \frac{1}{c} \end{vmatrix}$$
$$\Rightarrow \Delta = (abc) \begin{vmatrix} a + \frac{1}{a} & -\frac{1}{a} & a \\ b & \frac{1}{b} & b \\ c & 0 & c + \frac{1}{c} \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (abc) \begin{vmatrix} a + \frac{1}{a} & -\frac{1}{a} & a - \left(a + \frac{1}{a}\right) \\ b & \frac{1}{b} & b - b \\ c & 0 & c + \frac{1}{c} - c \end{vmatrix}$$
$$\Rightarrow \Delta = (abc) \begin{vmatrix} a + \frac{1}{a} & -\frac{1}{a} & -\frac{1}{a} \\ b & \frac{1}{b} & 0 \\ c & 0 & \frac{1}{c} \end{vmatrix}$$

Multiplying a, b and c to  $\mathsf{R}_1,\,\mathsf{R}_2$  and  $\mathsf{R}_3,\,we$  get

$$\Delta = \begin{vmatrix} a\left(a+\frac{1}{a}\right) & a\left(-\frac{1}{a}\right) & a\left(-\frac{1}{a}\right) \\ b(b) & b\left(\frac{1}{b}\right) & 0 \\ c(c) & 0 & c\left(\frac{1}{c}\right) \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a^2+1 & -1 & -1 \\ b^2 & 1 & 0 \\ c^2 & 0 & 1 \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} a^2 + 1 + b^2 & -1 + 1 & -1 + 0 \\ b^2 & 1 & 0 \\ c^2 & 0 & 1 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 + a^2 + b^2 & 0 & -1 \\ b^2 & 1 & 0 \\ c^2 & 0 & 1 \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} 1 + a^2 + b^2 + c^2 & 0 + 0 & -1 + 1 \\ b^2 & 1 & 0 \\ c^2 & 0 & 1 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 + a^2 + b^2 + c^2 & 0 & 0 \\ b^2 & 1 & 0 \\ c^2 & 0 & 1 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = (1 + a^{2} + b^{2} + c^{2})[(1)(1) - (0)(0)] - 0 + 0$$
  

$$\Rightarrow \Delta = (1 + a^{2} + b^{2} + c^{2})(1)$$
  

$$\therefore \Delta = 1 + a^{2} + b^{2} + c^{2}$$
  
Thus,  $\begin{vmatrix} a^{2} + 1 & ab & ac \\ ab & b^{2} + 1 & bc \\ ca & cb & c^{2} + 1 \end{vmatrix} = 1 + a^{2} + b^{2} + c^{2}$ 

#### 30. Question

Prove the following identities -

$$\begin{vmatrix} 1 & a & a^2 \\ a^2 & 1 & a \\ a & a^2 & 1 \end{vmatrix} = (a^3 - 1)^2$$

#### Answer

 $\operatorname{Let} \Delta = \begin{vmatrix} 1 & a & a^2 \\ a^2 & 1 & a \\ a & a^2 & 1 \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} 1 + a^2 & a + 1 & a^2 + a \\ a^2 & 1 & a \\ a & a^2 & 1 \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} 1 + a^2 + a & a + 1 + a^2 & a^2 + a + 1 \\ a^2 & 1 & a \\ a & a^2 & 1 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a^2 + a + 1 & a^2 + a + 1 & a^2 + a + 1 \\ a^2 & 1 & a \\ a & a^2 & 1 \end{vmatrix}$$

Taking the term ( $a^2 + a + 1$ ) common from  $R_1$ , we get

$$\Delta = (a^2 + a + 1) \begin{vmatrix} 1 & 1 & 1 \\ a^2 & 1 & a \\ a & a^2 & 1 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

 $\Delta = (a^{2} + a + 1) \begin{vmatrix} 1 & 1 - 1 & 1 \\ a^{2} & 1 - a^{2} & a \\ a & a^{2} - a & 1 \end{vmatrix}$  $\Rightarrow \Delta = (a^{2} + a + 1) \begin{vmatrix} 1 & 0 & 1 \\ a^{2} & 1 - a^{2} & a \\ a & a^{2} - a & 1 \end{vmatrix}$ 

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (a^{2} + a + 1) \begin{vmatrix} 1 & 0 & 1 - 1 \\ a^{2} & 1 - a^{2} & a - a^{2} \\ a & a^{2} - a & 1 - a \end{vmatrix}$$

$$\Rightarrow \Delta = (a^{2} + a + 1) \begin{vmatrix} 1 & 0 & 0 \\ a^{2} & 1 - a^{2} & a - a^{2} \\ a & a^{2} - a & 1 - a \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = (a^{2} + a + 1)(1)[(1 - a^{2})(1 - a) - (a^{2} - a)(a - a^{2})]$$

$$\Rightarrow \Delta = (a^{2} + a + 1)(1 - a - a^{2} + a^{3} - a^{3} + a^{4} + a^{2} - a^{3})$$

$$\Rightarrow \Delta = (a^{2} + a + 1)(1 - a - a^{3} + a^{4})$$

$$\Rightarrow \Delta = (a^{2} + a + 1)(a^{4} - a^{3} - a + 1)$$

$$\Rightarrow \Delta = (a^{2} + a + 1)[a^{3}(a - 1) - (a - 1)]$$

$$\Rightarrow \Delta = (a^{2} + a + 1)(a - 1)(a^{3} - 1)$$

$$\Rightarrow \Delta = (a^{2} + a + 1)(a^{3} - 1)$$

$$\Rightarrow \Delta = (a^{3} - 1)(a^{3} - 1)$$

$$\therefore \Delta = (a^{3} - 1)^{2}$$
Thus,
$$\begin{vmatrix} 1 & a & a^{2} \\ a^{2} & 1 & a \\ a & a^{2} & 1 \end{vmatrix} = (a^{3} - 1)^{2}$$

## 31. Question

Prove the following identities -

$$\begin{vmatrix} a+b+c & -c & -b \\ -c & a+b+c & -c \\ -b & -a & a+b+c \end{vmatrix} = 2(a+b)(b+c)(c+a)$$

#### Answer

Let 
$$\Delta = \begin{vmatrix} a+b+c & -c & -b \\ -c & a+b+c & -a \\ -b & -a & a+b+c \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} a+b+c+(-c) & -c+(a+b+c) & -b+(-a) \\ -c & a+b+c & -a \\ -b & -a & a+b+c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a+b & a+b & -b-a \\ -c & a+b+c & -a \\ -b & -a & a+b+c \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} a+b+(-b) & a+b+(-a) & -b-a+(a+b+c) \\ -c & a+b+c & -a \\ -b & -a & a+b+c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a & b & c \\ -c & a+b+c & -a \\ -b & -a & a+b+c \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 + C_1$ , we get

$$\Delta = \begin{vmatrix} a & b+a & c \\ -c & a+b+c+(-c) & -a \\ -b & -a+(-b) & a+b+c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a & b+a & c \\ -c & a+b & -a \\ -b & -(a+b) & a+b+c \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 + C_1$ , we get

$$\Delta = \begin{vmatrix} a & b+a & c+a \\ -c & a+b & -a+(-c) \\ -b & -(a+b) & a+b+c+(-b) \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a & b+a & c+a \\ -c & a+b & -(a+c) \\ -b & -(a+b) & a+c \end{vmatrix}$$

Taking (a + b) and (c + a) common from  $C_2$  and  $C_3$ , we get

$$\Delta = (a+b)(c+a) \begin{vmatrix} a & 1 & 1 \\ -c & 1 & -1 \\ -b & -1 & 1 \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 + R_1$ , we get

$$\Delta = (a+b)(c+a) \begin{vmatrix} a & 1 & 1 \\ -c+a & 1+1 & -1+1 \\ -b & -1 & 1 \end{vmatrix}$$
$$\Rightarrow \Delta = (a+b)(c+a) \begin{vmatrix} a & 1 & 1 \\ -c+a & 2 & 0 \\ -b & -1 & 1 \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (a+b)(c+a) \begin{vmatrix} a & 1 & 1 \\ -c+a & 2 & 0 \\ -b-a & -1-1 & 1-1 \end{vmatrix}$$
$$\Rightarrow \Delta = (a+b)(c+a) \begin{vmatrix} a & 1 & 1 \\ -c+a & 2 & 0 \\ -b-a & -2 & 0 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{C}_3,$  we have

$$\Delta = (a + b)(c + a)[(-c + a)(-2) - (-b - a)(2)]$$
  

$$\Rightarrow \Delta = (a + b)(c + a)[2c - 2a + 2a + 2b]$$
  

$$\Rightarrow \Delta = (a + b)(c + a)(2b + 2c)$$
  

$$\therefore \Delta = 2(a + b)(b + c)(c + a)$$
  
Thus,  $\begin{vmatrix} a + b + c & -c & -b \\ -c & a + b + c & -a \\ -b & -a & a + b + c \end{vmatrix} = 2(a + b)(b + c)(c + a)$ 

## 32. Question

Prove the following identities -

$$\begin{vmatrix} b + c & a & a \\ b & c + a & b \\ c & c & a + b \end{vmatrix} = 4abc$$

Answer

r www.studentbro.in

Let 
$$\Delta = \begin{vmatrix} b+c & a & a \\ b & c+a & b \\ c & c & a+b \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = \begin{vmatrix} b+c-b & a-(c+a) & a-b \\ b & c+a & b \\ c & c & a+b \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} c & -c & a-b \\ b & c+a & b \\ c & c & a+b \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 - R_3$ , we get

 $\Delta = \begin{vmatrix} c - c & -c - c & a - b - (a + b) \\ b & c + a & b \\ c & c & a + b \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 0 & -2c & -2b \\ b & c + a & b \\ c & c & a + b \end{vmatrix}$ 

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = \begin{vmatrix} 0 & -2c - 0 & -2b \\ b & c + a - b & b \\ c & c - c & a + b \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 0 & -2c & -2b \\ b & c + a - b & b \\ c & 0 & a + b \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = \begin{vmatrix} 0 & -2c & -2b - 0 \\ b & c + a - b & b - b \\ c & 0 & a + b - c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 0 & -2c & -2b \\ b & c + a - b & 0 \\ c & 0 & a + b - c \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Rightarrow \Delta = 0 + (2c)[(b)(a + b - c)] + (-2b)[-(c)(c + a - b)]$$
  

$$\Rightarrow \Delta = 2bc(a + b - c) + 2bc(c + a - b)$$
  

$$\Rightarrow \Delta = 2bc[(a + b - c) + (c + a - b)]$$
  

$$\Rightarrow \Delta = 2bc[2a]$$
  

$$\therefore \Delta = 4abc$$
  
Thus,  $\begin{vmatrix} b + c & a & a \\ b & c + a & b \\ c & c & a + b \end{vmatrix} = 4abc$ 

## 33. Question

Prove the following identities -

$$\begin{vmatrix} b^{2} + c^{2} & ab & ac \\ ba & c^{2} + a^{2} & bc \\ ca & cb & a^{2} + b^{2} \end{vmatrix} = 4a^{2}b^{2}c^{2}$$

#### Answer

Let  $\Delta = \begin{vmatrix} b^2 + c^2 & ab & ac \\ ba & c^2 + a^2 & bc \\ ca & cb & a^2 + b^2 \end{vmatrix}$ 

Multiplying a, b and c to  $\mathsf{R}_1,\,\mathsf{R}_2$  and  $\mathsf{R}_3,\,we$  get

$$\Delta = \frac{1}{abc} \begin{vmatrix} a(b^2 + c^2) & a(ab) & a(ac) \\ b(ba) & b(c^2 + a^2) & b(bc) \\ c(ca) & c(cb) & c(a^2 + b^2) \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{1}{abc} \begin{vmatrix} a(b^2 + c^2) & a^2b & a^2c \\ b^2a & b(c^2 + a^2) & b^2c \\ c^2a & c^2b & c(a^2 + b^2) \end{vmatrix}$$

Dividing  $\mathsf{C}_1,\,\mathsf{C}_2$  and  $\mathsf{C}_3$  with a, b and c, we get

$$\Delta = \begin{vmatrix} b^2 + c^2 & a^2 & a^2 \\ b^2 & c^2 + a^2 & b^2 \\ c^2 & c^2 & a^2 + b^2 \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = \begin{vmatrix} b^2 + c^2 - b^2 & a^2 - (c^2 + a^2) & a^2 - b^2 \\ b^2 & c^2 + a^2 & b^2 \\ c^2 & c^2 & a^2 + b^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} c^2 & -c^2 & a^2 - b^2 \\ b^2 & c^2 + a^2 & b^2 \\ c^2 & c^2 & a^2 + b^2 \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 - R_3$ , we get

$$\Delta = \begin{vmatrix} c^2 - c^2 & -c^2 - c^2 & a^2 - b^2 - (a^2 + b^2) \\ b^2 & c^2 + a^2 & b^2 \\ c^2 & c^2 & a^2 + b^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 0 & -2c^2 & -2b^2 \\ b^2 & c^2 + a^2 & b^2 \\ c^2 & c^2 & a^2 + b^2 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = \begin{vmatrix} 0 & -2c^2 - 0 & -2b^2 \\ b^2 & c^2 + a^2 - b^2 & b^2 \\ c^2 & c^2 - c^2 & a^2 + b^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 0 & -2c^2 & -2b^2 \\ b^2 & c^2 + a^2 - b^2 & b^2 \\ c^2 & 0 & a^2 + b^2 \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = \begin{vmatrix} 0 & -2c^2 & -2b^2 - 0 \\ b^2 & c^2 + a^2 - b^2 & b^2 - b^2 \\ c^2 & 0 & a^2 + b^2 - c^2 \end{vmatrix}$$

$$\Rightarrow \Delta = \begin{vmatrix} 0 & -2c^2 & -2b^2 \\ b^2 & c^2 + a^2 - b^2 & 0 \\ c^2 & 0 & a^2 + b^2 - c^2 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = 0 + (2c^{2})[(b^{2})(a^{2} + b^{2} - c^{2})] + (-2b^{2})[-(c^{2})(c^{2} + a^{2} - b^{2})]$$
  

$$\Rightarrow \Delta = 2b^{2}c^{2}(a^{2} + b^{2} - c^{2}) + 2b^{2}c^{2}(c^{2} + a^{2} - b^{2})$$
  

$$\Rightarrow \Delta = 2b^{2}c^{2}[(a^{2} + b^{2} - c^{2}) + (c^{2} + a^{2} - b^{2})]$$
  

$$\Rightarrow \Delta = 2b^{2}c^{2}[2a^{2}]$$
  

$$\therefore \Delta = 4a^{2}b^{2}c^{2}$$
  
Thus,  $\begin{vmatrix} b^{2} + c^{2} & ab & ac \\ ba & c^{2} + a^{2} & bc \\ ca & cb & a^{2} + b^{2} \end{vmatrix} = 4a^{2}b^{2}c^{2}$ 

#### 34. Question

Prove the following identities -

$$\begin{vmatrix} 0 & b^{2}a & c^{2}a \\ a^{2}b & 0 & c^{2}b \\ a^{2}c & b^{2}c & 0 \end{vmatrix} = 2a^{3}b^{3}c^{3}$$

#### Answer

Let  $\Delta = \begin{vmatrix} 0 & b^2 a & c^2 a \\ a^2 b & 0 & c^2 b \\ a^2 c & b^2 c & 0 \end{vmatrix}$ 

Taking  $\mathsf{a}^2,\,\mathsf{b}^2$  and  $\mathsf{c}^2$  common from  $\mathsf{C}_1,\,\mathsf{C}_2$  and  $\mathsf{C}_3,$  we get

$$\Delta = (a^2b^2c^2) \begin{vmatrix} 0 & a & a \\ b & 0 & b \\ c & c & 0 \end{vmatrix}$$

Taking a, b and c common from  $\mathsf{R}_1,\,\mathsf{R}_2$  and  $\mathsf{R}_3,$  we get

$$\Rightarrow \Delta = (a^{3}b^{3}c^{3}) \begin{vmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_2 \rightarrow C_2 - C_3$ , we get

$$\Delta = (a^{3}b^{3}c^{3}) \begin{vmatrix} 0 & 1-1 & 1 \\ 1 & 0-1 & 1 \\ 1 & 1-0 & 0 \end{vmatrix}$$
$$\Rightarrow \Delta = (a^{3}b^{3}c^{3}) \begin{vmatrix} 0 & 0 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & 0 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = (a^{3}b^{3}c^{3})[0 - 0 + 1(1)(1) - (1)(-1)]$$
  

$$\Rightarrow \Delta = (a^{3}b^{3}c^{3})[1 + 1]$$
  

$$\therefore \Delta = 2a^{3}b^{3}c^{3}$$

Thus, 
$$\begin{vmatrix} 0 & b^2 a & c^2 a \\ a^2 b & c^2 + a^2 & c^2 b \\ a^2 c & b^2 c & 0 \end{vmatrix} = 2a^3b^3c^3$$

## 35. Question

Prove the following identities -

$$\begin{vmatrix} \frac{a^2 + b^2}{c} & c & c \\ a & \frac{b^2 + c^2}{a} & a \\ b & b & \frac{c^2 + a^2}{b} \end{vmatrix} = 4abc$$

Answer

Let 
$$\Delta = \begin{vmatrix} \frac{a^2 + b^2}{c} & c & c \\ a & \frac{b^2 + c^2}{a} & a \\ b & b & \frac{c^2 + a^2}{b} \end{vmatrix}$$

Multiplying c, a and b to  $\mathsf{R}_1,\,\mathsf{R}_2$  and  $\mathsf{R}_3,\,we$  get

$$\Delta = \frac{1}{abc} \begin{vmatrix} a^2 + b^2 & c^2 & c^2 \\ a^2 & b^2 + c^2 & a^2 \\ b^2 & b^2 & c^2 + a^2 \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = \frac{1}{abc} \begin{vmatrix} a^2 + b^2 - a^2 & c^2 - (b^2 + c^2) & c^2 - a^2 \\ a^2 & b^2 + c^2 & a^2 \\ b^2 & b^2 & c^2 + a^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{1}{abc} \begin{vmatrix} b^2 & -b^2 & c^2 - a^2 \\ a^2 & b^2 + c^2 & a^2 \\ b^2 & b^2 & c^2 + a^2 \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 - R_3$ , we get

$$\Delta = \frac{1}{abc} \begin{vmatrix} b^2 - b^2 & -b^2 - b^2 & c^2 - a^2 - (c^2 + a^2) \\ a^2 & b^2 + c^2 & a^2 \\ b^2 & b^2 & c^2 + a^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{1}{abc} \begin{vmatrix} 0 & -2b^2 & -2a^2 \\ a^2 & b^2 + c^2 & a^2 \\ b^2 & b^2 & c^2 + a^2 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = \frac{1}{abc} \begin{vmatrix} 0 & -2b^2 - 0 & -2a^2 \\ a^2 & b^2 + c^2 - a^2 & a^2 \\ b^2 & b^2 - b^2 & c^2 + a^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{1}{abc} \begin{vmatrix} 0 & -2b^2 & -2a^2 \\ a^2 & b^2 + c^2 - a^2 & a^2 \\ b^2 & 0 & c^2 + a^2 \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = \frac{1}{abc} \begin{vmatrix} 0 & -2b^2 & -2a^2 - 0 \\ a^2 & b^2 + c^2 - a^2 & a^2 - a^2 \\ b^2 & 0 & c^2 + a^2 - b^2 \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{1}{abc} \begin{vmatrix} 0 & -2b^2 & -2a^2 \\ a^2 & b^2 + c^2 - a^2 & 0 \\ b^2 & 0 & c^2 + a^2 - b^2 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = \frac{1}{abc} \{ 0 + 2b^{2} [a^{2} (c^{2} + a^{2} - b^{2})] - 2a^{2} [-b^{2} (b^{2} + c^{2} - a^{2})] \}$$

$$\Rightarrow \Delta = \frac{1}{abc} \{ 2b^{2}a^{2} (c^{2} + a^{2} - b^{2}) + 2a^{2}b^{2} (b^{2} + c^{2} - a^{2}) \}$$

$$\Rightarrow \Delta = \frac{1}{abc} [2b^{2}a^{2} (c^{2} + a^{2} - b^{2} + b^{2} + c^{2} - a^{2})]$$

$$\Rightarrow \Delta = \frac{1}{abc} [2b^{2}a^{2} (2c^{2})]$$

$$\Rightarrow \Delta = \frac{1}{abc} [4a^{2}b^{2}c^{2}]$$

$$\therefore \Delta = 4abc$$

$$|\frac{a^{2} + b^{2}}{c} + c + c + c^{2} - a^{2}|$$

Thus, 
$$\begin{vmatrix} \frac{1}{c} & c & c \\ a & \frac{b^2 + c^2}{a} & a \\ b & b & \frac{c^2 + a^2}{b} \end{vmatrix} = 4abc$$

#### 36. Question

Prove the following identities -

$$\begin{vmatrix} -bc & b^{2} + bc & c^{2} + bc \\ a^{2} + ac & -ac & c^{2} + ac \\ a^{2} + ab & b^{2} + ab & -ab \end{vmatrix} = (ab + bc + ca)^{3}$$

#### Answer

Let 
$$\Delta = \begin{vmatrix} -bc & b^2 + bc & c^2 + bc \\ a^2 + ac & -ac & c^2 + ac \\ a^2 + ab & b^2 + ab & -ab \end{vmatrix}$$

Multiplying a, b and c to  $\mathsf{R}_1,\,\mathsf{R}_2$  and  $\mathsf{R}_3,\,we$  get

$$\Delta = \frac{1}{abc} \begin{vmatrix} -bc(a) & (b^{2} + bc)a & (c^{2} + bc)a \\ (a^{2} + ac)b & (-ac)b & (c^{2} + ac)b \\ (a^{2} + ab)c & (b^{2} + ab)c & (-ab)c \end{vmatrix}$$
$$\Rightarrow \Delta = \frac{1}{abc} \begin{vmatrix} -abc & ab^{2} + abc & ac^{2} + abc \\ a^{2}b + abc & -acb & bc^{2} + abc \\ a^{2}c + abc & b^{2}c + abc & -abc \end{vmatrix}$$

Dividing  $\mathsf{C}_1,\,\mathsf{C}_2$  and  $\mathsf{C}_3$  with a, b and c, we get

$$\Delta = \begin{vmatrix} -bc & ab + ac & ac + ab \\ ab + bc & -ac & bc + ab \\ ac + bc & bc + ac & -ab \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

CLICK HERE

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

 $\Delta = \begin{vmatrix} -bc + (ab + bc) & ab + ac + (-ac) & ac + ab + (bc + ab) \\ ab + bc & -ac & bc + ab \\ ac + bc & bc + ac & -ab \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} ab & ab & 2ab + bc + ac \\ ab + bc & -ac & bc + ab \\ ac + bc & bc + ac & -ab \end{vmatrix}$ 

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

 $\Delta = \begin{vmatrix} ab + (ac + bc) & ab + (bc + ac) & 2ab + bc + ac + (-ab) \\ ab + bc & -ac & bc + ab \\ ac + bc & bc + ac & -ab \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} ab + bc + ca & ab + bc + ca \\ ab + bc & -ac & bc + ab \\ ac + bc & bc + ac & -ab \end{vmatrix}$ 

Taking the term (a – b – c) common from  $R_1$ , we get

 $\Delta = (ab + bc + ca) \begin{vmatrix} 1 & 1 & 1 \\ ab + bc & -ac & bc + ab \\ ac + bc & bc + ac & -ab \end{vmatrix}$ 

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = (ab + bc + ca) \begin{vmatrix} 1 & 1 - 1 & 1 \\ ab + bc & -ac - (ab + bc) & bc + ab \\ ac + bc & bc + ac - (ac + bc) & -ab \end{vmatrix}$$

$$\Rightarrow \Delta = (ab + bc + ca) \begin{vmatrix} 1 & 0 & 1 \\ ab + bc & -(ab + bc + ca) & bc + ab \\ ac + bc & 0 & -ab \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (ab + bc + ca) \begin{vmatrix} 1 & 0 & 1 - 1 \\ ab + bc & -(ab + bc + ca) & bc + ab - (ab + bc) \\ ac + bc & 0 & -ab - (ac + bc) \end{vmatrix}$$

$$\Rightarrow \Delta = (ab + bc + ca) \begin{vmatrix} ab + bc & -(ab + bc + ca) \\ ac + bc & 0 \end{vmatrix} = 0$$

Expanding the determinant along R<sub>1</sub>, we have

$$\Delta = (ab + bc + ca)(1)[(ab + bc + ca)(ab + bc + ca)]$$

$$\therefore \Delta = (ab + bc + ca)^3$$

Thus, 
$$\begin{vmatrix} -bc & b^2 + bc & c^2 + bc \\ a^2 + ac & -ac & c^2 + ac \\ a^2 + ab & b^2 + ab & -ab \end{vmatrix} = (ab + bc + ca)^3$$

## 37. Question

Prove the following identities -

$$\begin{vmatrix} x + \lambda & 2x & 2x \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix} = (5x + \lambda)(\lambda - x)^2$$

#### Answer

Let 
$$\Delta = \begin{vmatrix} x + \lambda & 2x & 2x \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} x + \lambda + 2x & 2x + (x + \lambda) & 2x + 2x \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 3x + \lambda & 3x + \lambda & 4x \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} 3x + \lambda + 2x & 3x + \lambda + 2x & 4x + (x + \lambda) \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 5x + \lambda & 5x + \lambda & 5x + \lambda \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix}$$

Taking the term (5x +  $\lambda$ ) common from R<sub>1</sub>, we get

$$\Delta = (5x + \lambda) \begin{vmatrix} 1 & 1 & 1 \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix}$$
  
Applying C<sub>2</sub>  $\rightarrow$  C<sub>2</sub> - C<sub>1</sub>, we get

$$\Delta = (5x + \lambda) \begin{vmatrix} 1 & 1 - 1 & 1 \\ 2x & x + \lambda - 2x & 2x \\ 2x & 2x - 2x & x + \lambda \end{vmatrix}$$
$$\Rightarrow \Delta = (5x + \lambda) \begin{vmatrix} 1 & 0 & 1 \\ 2x & \lambda - x & 2x \\ 2x & 0 & x + \lambda \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (5x + \lambda) \begin{vmatrix} 1 & 0 & 1 - 1 \\ 2x & \lambda - x & 2x - 2x \\ 2x & 0 & x + \lambda - 2x \end{vmatrix}$$
$$\Rightarrow \Delta = (5x + \lambda) \begin{vmatrix} 1 & 0 & 0 \\ 2x & \lambda - x & 0 \\ 2x & 0 & \lambda - x \end{vmatrix}$$

Expanding the determinant along  $R_1$ , we have

$$\Delta = (5x + \lambda)[(1)(\lambda - x)(\lambda - x)]$$

$$\therefore \Delta = (5x + \lambda)(\lambda - x)^2$$

Thus,  $\begin{vmatrix} x + \lambda & 2x & 2x \\ 2x & x + \lambda & 2x \\ 2x & 2x & x + \lambda \end{vmatrix} = (5x + \lambda)(\lambda - x)^2$ 

### 38. Question

Prove the following identities -

$$\begin{vmatrix} x + 4 & 2x & 2x \\ 2x & x + 4 & 2x \\ 2x & 2x & x + 4 \end{vmatrix} = (5x + 4)(4 - x)^2$$

#### Answer

Let  $\Delta = \begin{vmatrix} x+4 & 2x & 2x \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

 $\Delta = \begin{vmatrix} x + 4 + 2x & 2x + (x + 4) & 2x + 2x \\ 2x & x + 4 & 2x \\ 2x & 2x & x + 4 \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 3x + 4 & 3x + 4 & 4x \\ 2x & x + 4 & 2x \\ 2x & 2x & x + 4 \end{vmatrix}$ 

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

 $\Delta = \begin{vmatrix} 3x + 4 + 2x & 3x + 4 + 2x & 4x + (x+4) \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 5x + 4 & 5x + 4 & 5x + 4 \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix}$ 

Taking the term (5x + 4) common from  $R_1$ , we get

$$\Delta = (5x+4) \begin{vmatrix} 1 & 1 & 1 \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = (5x+4) \begin{vmatrix} 1 & 1-1 & 1 \\ 2x & x+4-2x & 2x \\ 2x & 2x-2x & x+4 \end{vmatrix}$$
$$\Rightarrow \Delta = (5x+4) \begin{vmatrix} 1 & 0 & 1 \\ 2x & 4-x & 2x \\ 2x & 0 & x+4 \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (5x+4) \begin{vmatrix} 1 & 0 & 1-1 \\ 2x & 4-x & 2x-2x \\ 2x & 0 & x+4-2x \end{vmatrix}$$
$$\Rightarrow \Delta = (5x+4) \begin{vmatrix} 1 & 0 & 0 \\ 2x & 4-x & 0 \\ 2x & 0 & 4-x \end{vmatrix}$$

Expanding the determinant along  $R_1$ , we have

$$\Delta = (5x + 4)[(1)(4 - x)(4 - x)]$$
  

$$\therefore \Delta = (5x + 4)(4 - x)^{2}$$
  
Thus,  $\begin{vmatrix} x + 4 & 2x & 2x \\ 2x & x + 4 & 2x \\ 2x & 2x & x + 4 \end{vmatrix} = (5x + 4)(4 - x)^{2}$ 

#### 39. Question

Prove the following identities -

 $\begin{vmatrix} y+z & z & y \\ z & z+x & x \\ y & x & x+y \end{vmatrix} = 4xyz$ 

#### Answer

Let  $\Delta = \begin{vmatrix} y+z & z & y \\ z & z+x & x \\ y & x & x+y \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = \begin{vmatrix} y + z - z & z - (z + x) & y - x \\ z & z + x & x \\ y & x & x + y \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} y & -x & y - x \\ z & z + x & x \\ y & x & x + y \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 - R_3$ , we get

$$\Delta = \begin{vmatrix} y - y & -x - x & y - x - (x + y) \\ z & z + x & x \\ y & x & x + y \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 0 & -2x & -2x \\ z & z + x & x \\ y & x & x + y \end{vmatrix}$$

Taking the term (-2x) common from  $R_1$ , we get

$$\Delta = (-2x) \begin{vmatrix} 0 & 1 & 1 \\ z & z+x & x \\ y & x & x+y \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_3$ , we get

$$\Delta = (-2x) \begin{vmatrix} 0 & 1 - 1 & 1 \\ z & z + x - x & x \\ y & x - (x + y) & x + y \end{vmatrix}$$
$$\Rightarrow \Delta = (-2x) \begin{vmatrix} 0 & 0 & 1 \\ z & z & x \\ y & -y & x + y \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

```
\Delta = (-2x)[(z)(-y) - (y)(z)]

\Rightarrow \Delta = (-2x)(-yz - yz)

\Rightarrow \Delta = (-2x)(-2yz)

\therefore \Delta = 4xyz

Thus, \begin{vmatrix} y+z & z & y \\ z & z+x & x \\ y & x & x+y \end{vmatrix} = 4xyz

40. Question
```

Prove the following identities -

$$\begin{vmatrix} -a(b^{2} + c^{2} - a^{2}) & 2b^{3} & 2c^{3} \\ 2a^{3} & -b(c^{2} + a^{2} - b^{2}) & 2c^{3} \\ 2a^{3} & 2b^{3} & -c(a^{2} + b^{2} - c^{2}) \end{vmatrix} = abc(a^{2} + b^{2} + c^{2})^{3}$$

Answer

Let 
$$\Delta = \begin{vmatrix} -a(b^2 + c^2 - a^2) & 2b^3 & 2c^3 \\ 2a^3 & -b(c^2 + a^2 - b^2) & 2c^3 \\ 2a^3 & 2b^3 & -c(a^2 + b^2 - c^2) \end{vmatrix}$$

Taking a, b and c common from  $C_1$ ,  $C_2$  and  $C_3$ , we get  $(b^2 + c^2 - a^2) = 2b^2 = 2c^2$ 

$$\Delta = (abc) \begin{vmatrix} -(b^2 + c^2 - a^2) & 2b^2 & 2c^2 \\ 2a^2 & -(c^2 + a^2 - b^2) & 2c^2 \\ 2a^2 & 2b^2 & -(a^2 + b^2 - c^2) \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ . Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$= (abc) \begin{vmatrix} -(b^{2} + c^{2} - a^{2}) - 2a^{2} & 2b^{2} - [-(c^{2} + a^{2} - b^{2})] & 2c^{2} - 2c^{2} \\ 2a^{2} & -(c^{2} + a^{2} - b^{2}) & 2c^{2} \\ 2a^{2} & 2b^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$
$$\Rightarrow \Delta = (abc) \begin{vmatrix} -(a^{2} + b^{2} + c^{2}) & a^{2} + b^{2} + c^{2} & 0 \\ 2a^{2} & -(c^{2} + a^{2} - b^{2}) & 2c^{2} \\ 2a^{2} & 2b^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$

Taking the term  $(a^2 + b^2 + c^2)$  common from R<sub>1</sub>, we get

$$\Delta = (abc)(a^{2} + b^{2} + c^{2}) \begin{vmatrix} -1 & 1 & 0 \\ 2a^{2} & -(c^{2} + a^{2} - b^{2}) & 2c^{2} \\ 2a^{2} & 2b^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_3$ , we get

$$\Delta = (abc)(a^{2} + b^{2}) \begin{vmatrix} -1 & 1 & 0 \\ 2a^{2} - 2a^{2} & -(c^{2} + a^{2} - b^{2}) - 2b^{2} & 2c^{2} - [-(a^{2} + b^{2} - c^{2})] \\ 2a^{2} & 2b^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$
  
$$\Rightarrow \Delta = (abc)(a^{2} + b^{2} + c^{2}) \begin{vmatrix} -1 & 1 & 0 \\ 0 & -(a^{2} + b^{2} + c^{2}) & (a^{2} + b^{2} + c^{2}) \\ 2a^{2} & 2b^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$

Taking the term  $(a^2 + b^2 + c^2)$  common from R<sub>2</sub>, we get

$$\Delta = (abc)(a^{2} + b^{2} + c^{2})^{2} \begin{vmatrix} -1 & 1 & 0 \\ 0 & -1 & 1 \\ 2a^{2} & 2b^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 + C_1$ , we get

$$\Delta = (abc)(a^2 + b^2 + c^2)^2 \begin{vmatrix} -1 & 1 + (-1) & 0 \\ 0 & -1 + 0 & 1 \\ 2a^2 & 2b^2 + 2a^2 & -(a^2 + b^2 - c^2) \end{vmatrix}$$

## R www.studentbro.in

$$\Rightarrow \Delta = (abc)(a^{2} + b^{2} + c^{2})^{2} \begin{vmatrix} -1 & 0 & 0 \\ 0 & -1 & 1 \\ 2a^{2} & 2b^{2} + 2a^{2} & -(a^{2} + b^{2} - c^{2}) \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = (abc)(a^{2} + b^{2} + c^{2})^{2}(-1)[(a^{2} + b^{2} - c^{2}) - (2b^{2} + 2a^{2})]$$

$$\Rightarrow \Delta = (abc)(a^{2} + b^{2} + c^{2})^{2}[-(a^{2} + b^{2} - c^{2}) + (2b^{2} + 2a^{2})]$$

$$\Rightarrow \Delta = (abc)(a^{2} + b^{2} + c^{2})^{2}[-a^{2} - b^{2} + c^{2} + 2b^{2} + 2a^{2}]$$

$$\Rightarrow \Delta = (abc)(a^{2} + b^{2} + c^{2})^{2}[a^{2} + b^{2} + c^{2}]$$

$$\therefore \Delta = (abc)(a^{2} + b^{2} + c^{2})^{3}$$
Thus, 
$$\begin{vmatrix} -a(b^{2} + c^{2} - a^{2}) & 2b^{3} & 2c^{3} \\ 2a^{3} & -b(c^{2} + a^{2} - b^{2}) & 2c^{3} \\ 2a^{3} & 2b^{3} & -c(a^{2} + b^{2} - c^{2}) \end{vmatrix} = abc(a^{2} + b^{2} + b$$

#### 41. Question

Prove the following identities -

 $\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix} = a^3 + 3a^2$ 

#### Answer

Let  $\Delta = \begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

Δ =	1+a+1	1+(1+a)	1+1
	1	1+a	1
	1	1	1+a
⇒ ∆ :	=  2 + a 1 1	2+a 2 1+a 1 1 1+a	

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

```
\Delta = \begin{vmatrix} 2+a+1 & 2+a+1 & 2+(1+a) \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}\Rightarrow \Delta = \begin{vmatrix} 3+a & 3+a & 3+a \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}
```

Taking the term (3 + a) common from  $R_1$ , we get

 $\Delta = (3+a) \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$ 

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = (3+a) \begin{vmatrix} 1 & 1-1 & 1 \\ 1 & 1+a-1 & 1 \\ 1 & 1-1 & 1+a \end{vmatrix}$$
$$\Rightarrow \Delta = (3+a) \begin{vmatrix} 1 & 0 & 1 \\ 1 & a & 1 \\ 1 & 0 & 1+a \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (3+a) \begin{vmatrix} 1 & 0 & 1-1 \\ 1 & a & 1-1 \\ 1 & 0 & 1+a-1 \end{vmatrix}$$
$$\Rightarrow \Delta = (3+a) \begin{vmatrix} 1 & 0 & 0 \\ 1 & a & 0 \\ 1 & 0 & a \end{vmatrix}$$

Expanding the determinant along  $\mathsf{R}_1,$  we have

$$\Delta = (3 + a)(1)[(a)(a) - 0]$$
  

$$\Rightarrow \Delta = (3 + a)(a^{2})$$
  

$$\therefore \Delta = a^{3} + 3a^{2}$$
  
Thus,  $\begin{vmatrix} 1 + a & 1 & 1 \\ 1 & 1 + a & 1 \\ 1 & 1 & 1 + a \end{vmatrix} = a^{3} + 3a^{2}$ 

## 42. Question

Prove the following identities -

$$\begin{vmatrix} 2y & y - z - x & 2y \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix} = (x + y + z)^3$$

#### Answer

Let 
$$\Delta = \begin{vmatrix} 2y & y - z - x & 2y \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} 2y + 2z & y - z - x + 2z & 2y + (z - x - y) \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2y + 2z & y + z - x & z - x + y \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} 2y + 2z + (x - y - z) & y + z - x + 2x & z - x + y + 2x \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} x + y + z & x + y + z \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix}$$

Get More Learning Materials Here : 📕

# R www.studentbro.in

Taking the term (x + y + z) common from  $R_1$ , we get

$$\Delta = (x + y + z) \begin{vmatrix} 1 & 1 & 1 \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = (x + y + z) \begin{vmatrix} 1 & 1 - 1 & 1 \\ 2z & 2z - 2z & z - x - y \\ x - y - z & 2x - (x - y - z) & 2x \end{vmatrix}$$
$$\Rightarrow \Delta = (x + y + z) \begin{vmatrix} 1 & 0 & 1 \\ 2z & 0 & z - x - y \\ x - y - z & x + y + z & 2x \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = (x + y + z) \begin{vmatrix} 1 & 0 & 1 - 1 \\ 2z & 0 & z - x - y - 2z \\ x - y - z & x + y + z & 2x - (x - y - z) \end{vmatrix}$$
$$\Rightarrow \Delta = (x + y + z) \begin{vmatrix} 1 & 0 & 0 \\ 2z & 0 & -(x + y + z) \\ x - y - z & x + y + z & x + y + z \end{vmatrix}$$

Expanding the determinant along  $R_1$ , we have

$$\Delta = (x + y + z)(1)[0 - (-(x + y + z)(x + y + z))]$$
  

$$\Rightarrow \Delta = (x + y + z)(x + y + z)(x + y + z)$$
  

$$\therefore \Delta = (x + y + z)^{3}$$
  
Thus,  $\begin{vmatrix} 2y & y - z - x & 2y \\ 2z & 2z & z - x - y \\ x - y - z & 2x & 2x \end{vmatrix} = (x + y + z)^{3}$ 

#### 43. Question

Prove the following identities -

$$\begin{vmatrix} y + z & x & y \\ z + x & z & x \\ x + y & y & z \end{vmatrix} = (z + y + z)(x - z)^2$$

#### Answer

Let  $\Delta = \begin{vmatrix} y+z & x & y \\ z+x & z & x \\ x+y & y & z \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

```
\Delta = \begin{vmatrix} y + z + (z + x) & x + z & y + x \\ z + x & z & x \\ x + y & y & z \end{vmatrix}\Rightarrow \Delta = \begin{vmatrix} x + y + 2z & x + z & y + x \\ z + x & z & x \\ x + y & y & z \end{vmatrix}
```

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} x + y + 2z + (x + y) & x + z + y & y + x + z \\ z + x & z & x \\ x + y & y & z \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2(x + y + z) & x + y + z & x + y + z \\ z + x & z & x \\ x + y & y & z \end{vmatrix}$$

Taking the term (x + y + z) common from  $R_1$ , we get

$$\Delta = (x + y + z) \begin{vmatrix} 2 & 1 & 1 \\ z + x & z & x \\ x + y & y & z \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 - C_2$ , we get

$$\Delta = (x + y + z) \begin{vmatrix} 2 - 1 & 1 & 1 \\ z + x - z & z & x \\ x + y - y & y & z \end{vmatrix}$$
$$\Rightarrow \Delta = (x + y + z) \begin{vmatrix} 1 & 1 & 1 \\ x & z & x \\ x & y & z \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 - C_3$ , we get

$$\Delta = (x + y + z) \begin{vmatrix} 1 - 1 & 1 & 1 \\ x - x & z & x \\ x - z & y & z \end{vmatrix}$$
$$\Rightarrow \Delta = (x + y + z) \begin{vmatrix} 0 & 1 & 1 \\ 0 & z & x \\ x - z & y & z \end{vmatrix}$$

Expanding the determinant along  $\mathsf{C}_1,$  we have

$$\Delta = (x + y + z)(x - z)[(1)(x) - (z)(1)]$$
  

$$\Rightarrow \Delta = (x + y + z)(x - z)(x - z)$$
  

$$\therefore \Delta = (x + y + z)(x - z)^{2}$$
  
Thus, 
$$\begin{vmatrix} y + z & x & y \\ z + x & z & x \\ x + y & y & z \end{vmatrix} = (x + y + z)(x - z)^{2}$$

## 44. Question

Prove the following identities -

$$\begin{vmatrix} a+x & y & z \\ x & a+y & z \\ x & y & a+z \end{vmatrix} = a^2(a+x+y+z)$$

## Answer

Let  $\Delta = \begin{vmatrix} a+x & y & z \\ x & a+y & z \\ x & y & a+z \end{vmatrix}$ 

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

 $\Delta = \begin{vmatrix} a+x+y & y & z \\ x+(a+y) & a+y & z \\ x+y & y & a+z \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} a+x+y & y & z \\ a+x+y & a+y & z \\ x+y & y & a+z \end{vmatrix}$ 

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

 $\Delta = \begin{vmatrix} a+x+y+z & y & z \\ a+x+y+z & a+y & z \\ x+y+(a+z) & y & a+z \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} a+x+y+z & y & z \\ a+x+y+z & a+y & z \\ a+x+y+z & y & a+z \end{vmatrix}$ 

Taking the term (a + x + y + z) common from  $C_1$ , we get

$$\Delta = (\mathbf{a} + \mathbf{x} + \mathbf{y} + \mathbf{z}) \begin{vmatrix} 1 & \mathbf{y} & \mathbf{z} \\ 1 & \mathbf{a} + \mathbf{y} & \mathbf{z} \\ 1 & \mathbf{y} & \mathbf{a} + \mathbf{z} \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = (a + x + y + z) \begin{vmatrix} 1 & y & z \\ 1 - 1 & a + y - y & z - z \\ 1 & y & a + z \end{vmatrix}$$
$$\Rightarrow \Delta = (a + x + y + z) \begin{vmatrix} 1 & y & z \\ 0 & a & 0 \\ 1 & y & a + z \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (a + x + y + z) \begin{vmatrix} 1 & y & z \\ 0 & a & 0 \\ 1 - 1 & y - y & a + z - z \end{vmatrix}$$
$$\Rightarrow \Delta = (a + x + y + z) \begin{vmatrix} 1 & y & z \\ 0 & a & 0 \\ 0 & 0 & a \end{vmatrix}$$

Expanding the determinant along  $C_1$ , we have

 $\Delta = (a + x + y + z)(1)[(a)(a) - (0)(0)]$   $\Rightarrow \Delta = (a + x + y + z)(a)(a)$   $\therefore \Delta = a^{2}(a + x + y + z)$ Thus,  $\begin{vmatrix} a + x & y & z \\ x & a + y & z \\ x & y & a + z \end{vmatrix} = a^{2}(a + x + y + z)$ 

## 45. Question

Prove the following identities -

 $\begin{vmatrix} a^{3} & 2 & a \\ b^{3} & 2 & b \\ c^{3} & 2 & c \end{vmatrix} = 2(a - b)(b - c)(c - a)(a + b + c)$ 

#### Answer

🕀 www.studentbro.in

Let 
$$\Delta = \begin{vmatrix} a^3 & 2 & a \\ b^3 & 2 & b \\ c^3 & 2 & c \end{vmatrix}$$

Taking 2 common from  $C_2$ , we get

$$\Delta = 2 \begin{vmatrix} a^3 & 1 & a \\ b^3 & 1 & b \\ c^3 & 1 & c \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = 2 \begin{vmatrix} a^{3} & 1 & a \\ b^{3} - a^{3} & 1 - 1 & b - a \\ c^{3} & 1 & c \end{vmatrix}$$
$$\Rightarrow \Delta = 2 \begin{vmatrix} a^{3} & 1 & a \\ b^{3} - a^{3} & 0 & b - a \\ c^{3} & 1 & c \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = 2 \begin{vmatrix} a^{3} & 1 & a \\ b^{3} - a^{3} & 0 & b - a \\ c^{3} - a^{3} & 1 - 1 & c - a \end{vmatrix}$$
$$\Rightarrow \Delta = 2 \begin{vmatrix} a^{3} & 1 & a \\ b^{3} - a^{3} & 0 & b - a \\ c^{3} - a^{3} & 0 & c - a \end{vmatrix}$$

We have the identity  $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$ 

$$\Rightarrow \Delta = 2 \begin{vmatrix} a^3 & 1 & a \\ (b-a)(b^2+ba+a^2) & 0 & b-a \\ (c-a)(c^2+ca+a^2) & 0 & c-a \end{vmatrix}$$

Taking (b – a) and (c – a) common from  $\mathsf{R}_2$  and  $\mathsf{R}_3,$  we get

$$\Delta = 2(b-a)(c-a) \begin{vmatrix} a^3 & 1 & a \\ b^2 + ba + a^2 & 0 & 1 \\ c^2 + ca + a^2 & 0 & 1 \end{vmatrix}$$

We know that the sign of a determinant changes if any two rows or columns are interchanged.

By interchanging  $C_1$  and  $C_2$ , we get

$$\Delta = -2(b-a)(c-a) \begin{vmatrix} 1 & a^3 & a \\ 0 & b^2 + ba + a^2 & 1 \\ 0 & c^2 + ca + a^2 & 1 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{C}_1,$  we have

$$\Delta = -2(b - a)(c - a)(1)[(b^{2} + ba + a^{2}) - (c^{2} + ca + a^{2})]$$
  

$$\Rightarrow \Delta = 2(a - b)(c - a)[b^{2} + ba + a^{2} - c^{2} - ca - a^{2}]$$
  

$$\Rightarrow \Delta = 2(a - b)(c - a)[b^{2} + ba - c^{2} - ca]$$
  

$$\Rightarrow \Delta = 2(a - b)(c - a)[b^{2} - c^{2} + (ba - ca)]$$
  

$$\Rightarrow \Delta = 2(a - b)(c - a)[(b - c)(b + c) + (b - c)a]$$
  

$$\Rightarrow \Delta = 2(a - b)(c - a)(b - c)(b + c + a)$$
  

$$\therefore \Delta = 2(a - b)(b - c)(c - a)(a + b + c)$$

Thus, 
$$\begin{vmatrix} a^3 & 2 & a \\ b^3 & 2 & b \\ c^3 & 2 & c \end{vmatrix} = 2(a-b)(b-c)(c-a)(a+b+c)$$

#### 46. Question

Without expanding, prove that  $\begin{vmatrix} a & b & c \\ x & y & z \\ p & q & r \end{vmatrix} = \begin{vmatrix} x & y & z \\ p & q & r \\ a & b & c \end{vmatrix} = \begin{vmatrix} y & b & q \\ x & a & p \\ z & c & r \end{vmatrix}$ .

## Answer

$$Let \Delta = \begin{vmatrix} a & b & c \\ x & y & z \\ p & q & r \end{vmatrix}$$

We know that the sign of a determinant changes if any two rows or columns are interchanged.

By interchanging  $R_1$  and  $R_2$ , we get

$$\Delta = - \begin{vmatrix} x & y & z \\ a & b & c \\ p & q & r \end{vmatrix}$$

By interchanging  $R_2$  and  $R_3$ , we get

 $\Delta = -\left(-\begin{vmatrix}x & y & z\\p & q & r\\a & b & c\end{vmatrix}\right)$  $\Rightarrow \Delta = \begin{vmatrix}x & y & z\\p & q & r\\a & b & c\end{vmatrix}$ Hence,  $\begin{vmatrix}a & b & c\\x & y & z\\p & q & r\end{vmatrix} = \begin{vmatrix}x & y & z\\p & q & r\\a & b & c\end{vmatrix}$ 

	a	b	C
Let us once again consider $\underline{\Lambda} =$	х	У	z
	lp	q	rl

By interchanging  $\mathsf{R}_1$  and  $\mathsf{R}_2,$  we get

$$\Delta = - \begin{vmatrix} x & y & z \\ a & b & c \\ p & q & r \end{vmatrix}$$

By interchanging  $C_1$  and  $C_2$ , we get

$$\Delta = - \left( - \begin{vmatrix} y & x & z \\ b & a & c \\ q & p & r \end{vmatrix} \right)$$
$$\Rightarrow \Delta = \begin{vmatrix} y & x & z \\ b & a & c \\ q & p & r \end{vmatrix}$$

Recall that the value of a determinant remains same if it its rows and columns are interchanged.

$$\Rightarrow \Delta = \begin{vmatrix} y & b & q \\ x & a & p \\ z & c & r \end{vmatrix}$$
  
Hence, 
$$\begin{vmatrix} a & b & c \\ x & y & z \\ p & q & r \end{vmatrix} = \begin{vmatrix} y & b & q \\ x & a & p \\ z & c & r \end{vmatrix}$$

Thus, 
$$\begin{vmatrix} a & b & c \\ x & y & z \\ p & q & r \end{vmatrix} = \begin{vmatrix} x & y & z \\ p & q & r \\ a & b & c \end{vmatrix} = \begin{vmatrix} y & b & q \\ x & a & p \\ z & c & r \end{vmatrix}$$

## 47. Question

Show that 
$$\begin{vmatrix} x + 1 & x + 2 & x + a \\ x + 2 & x + 3 & x + b \\ x + 3 & x + 4 & x + c \end{vmatrix} = 0$$
 where a,b,c are in A.P.

#### Answer

Let 
$$\Delta = \begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying 
$$R_1 \rightarrow R_1 + R_3$$
, we get

$$\Delta = \begin{vmatrix} x+1+(x+3) & x+2+(x+4) & x+a+(x+c) \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2x+4 & 2x+6 & 2x+(a+c) \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$$

Given that a, b and c are in an A.P. Using the definition of an arithmetic progression, we have

b - a = c - b  $\Rightarrow b + b = c + a$   $\Rightarrow 2b = c + a$  $\therefore a + c = 2b$ 

By substituting this in the above equation to find  $\boldsymbol{\Delta},$  we get

$$\Delta = \begin{vmatrix} 2x+4 & 2x+6 & 2x+2b \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2(x+2) & 2(x+3) & 2(x+b) \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$$

Taking 2 common from  $R_1$ , we get

 $\Delta = 2 \begin{vmatrix} x+2 & x+3 & x+b \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$ 

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = 2 \begin{vmatrix} x + 2 - (x + 2) & x + 3 - (x + 3) & x + b - (x + b) \\ x + 2 & x + 3 & x + b \\ x + 3 & x + 4 & x + c \end{vmatrix}$$
  
$$\Rightarrow \Delta = 2 \begin{vmatrix} 0 & 0 & 0 \\ x + 2 & x + 3 & x + b \\ x + 3 & x + 4 & x + c \end{vmatrix}$$
  
$$\therefore \Delta = 0$$

Thus,  $\begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix} = 0$  when a, b and c are in A.P.

## 48. Question

Show that  $\begin{vmatrix} x - 3 & x - 4 & x - \alpha \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix} = 0$  where  $\alpha$ ,  $\beta$  and  $\gamma$  are in A.P.

#### Answer

Let 
$$\Delta = \begin{vmatrix} x - 3 & x - 4 & x - \alpha \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} x - 3 + (x - 1) & x - 4 + (x - 2) & x - \alpha + (x - \gamma) \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2x - 4 & 2x - 6 & 2x - (\alpha + \gamma) \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$

Given that  $\alpha$ ,  $\beta$  and  $\gamma$  are in an A.P. Using the definition of an arithmetic progression, we have

$$\beta - \alpha = \gamma - \beta$$
  

$$\Rightarrow \beta + \beta = \gamma + \alpha$$
  

$$\Rightarrow 2\beta = \gamma + \alpha$$
  

$$\therefore \alpha + \gamma = 2\beta$$

By substituting this in the above equation to find  $\boldsymbol{\Delta},$  we get

$$\Delta = \begin{vmatrix} 2x - 4 & 2x - 6 & 2x - 2\beta \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2(x - 2) & 2(x - 3) & 2(x - \beta) \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$

Taking 2 common from  $R_1$ , we get

$$\Delta = 2 \begin{vmatrix} x - 2 & x - 3 & x - \beta \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = 2 \begin{vmatrix} x - 2 - (x - 2) & x - 3 - (x - 3) & x - \beta - (x - \beta) \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$
$$\Rightarrow \Delta = 2 \begin{vmatrix} 0 & 0 & 0 \\ x - 2 & x - 3 & x - \beta \\ x - 1 & x - 2 & x - \gamma \end{vmatrix}$$
$$\therefore \Delta = 0$$

Get More Learning Materials Here : 📕

Regional www.studentbro.in

Thus,  $\begin{vmatrix} x-3 & x-4 & x-\alpha \\ x-2 & x-3 & x-\beta \\ x-1 & x-2 & x-\gamma \end{vmatrix} = 0$  when  $\alpha$ ,  $\beta$  and  $\gamma$  are in A.P.

#### 49. Question

If a, b, c are real numbers such that  $\begin{vmatrix} b+c & c+a & a+b \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix} = 0$ , then show that either a+b+c=0 or a=b=

c.

#### Answer

Let  $\Delta = \begin{vmatrix} b+c & c+a & a+b \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$ 

Given that  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_i$  or  $C_i \rightarrow C_i + kC_i$ .

Applying  $R_1 \rightarrow R_1 + R_2$ , we get

$$\Delta = \begin{vmatrix} b + c + (c+a) & c+a + (a+b) & a+b + (b+c) \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a+b+2c & 2a+b+c & a+2b+c \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$$

Applying  $R_1 \rightarrow R_1 + R_3$ , we get

$$\Delta = \begin{vmatrix} a+b+2c+(a+b) & 2a+b+c+(b+c) & a+2b+c+(c+a) \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 2(a+b+c) & 2(a+b+c) & 2(a+2b+c) \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$$

Taking the term 2(a + b + c) common from  $R_1$ , we get

$$\Delta = 2(a+b+c) \begin{vmatrix} 1 & 1 & 1 \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$$

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

$$\Delta = 2(a+b+c) \begin{vmatrix} 1 & 1-1 & 1 \\ c+a & a+b-(c+a) & b+c \\ a+b & b+c-(a+b) & c+a \end{vmatrix}$$

$$\Rightarrow \Delta = 2(a+b+c) \begin{vmatrix} 1 & 0 & 1 \\ c+a & b-c & b+c \\ a+b & c-a & c+a \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = 2(a+b+c) \begin{vmatrix} 1 & 0 & 1-1 \\ c+a & b-c & b+c-(c+a) \\ a+b & c-a & c+a-(a+b) \end{vmatrix}$$
$$\Rightarrow \Delta = 2(a+b+c) \begin{vmatrix} 1 & 0 & 0 \\ c+a & b-c & b-a \\ a+b & c-a & c-b \end{vmatrix}$$

Expanding the determinant along  $R_1$ , we have  $\Delta = 2(a + b + c)(1)[(b - c)(c - b) - (c - a)(b - a)]$  $\Rightarrow \Delta = 2(a + b + c)(bc - b^2 - c^2 + cb - cb + ca + ab - a^2)$  $\therefore \Delta = 2(a + b + c)(ab + bc + ca - a^2 - b^2 - c^2)$ We have  $\Delta = 0$  $\Rightarrow 2(a + b + c)(ab + bc + ca - a^2 - b^2 - c^2) = 0$  $\Rightarrow$  (a + b + c)(ab + bc + ca - a<sup>2</sup> - b<sup>2</sup> - c<sup>2</sup>) = 0 Case - I: a + b + c = 0Case - II:  $ab + bc + ca - a^2 - b^2 - c^2 = 0$  $\Rightarrow a^2 + b^2 + c^2 - ab - bc - ca = 0$ Multiplying 2 on both sides, we have  $2(a^2 + b^2 + c^2 - ab - bc - ca) = 0$  $\Rightarrow 2a^{2} + 2b^{2} + 2c^{2} - 2ab - 2bc - 2ca = 0$  $\Rightarrow a^{2} - 2ab + b^{2} + b^{2} - 2bc + c^{2} + c^{2} - 2ca + a^{2} = 0$  $\Rightarrow (a - b)^{2} + (b - c)^{2} + (c - a)^{2} = 0$ We know  $(a - b)^2 \ge 0$ ,  $(b - c)^2 \ge 0$ ,  $(c - a)^2 \ge 0$ If the sum of three non-negative numbers is zero, then each of the numbers is zero.

 $\Rightarrow (a - b)^{2} = 0 = (b - c)^{2} = (c - a)^{2}$   $\Rightarrow a - b = 0 = b - c = c - a$   $\Rightarrow a = b = c$ Thus, if  $\begin{vmatrix} b + c & c + a & a + b \\ c + a & a + b & b + c \\ a + b & b + c & c + a \end{vmatrix} = 0$ , then either a + b + c = 0 or a = b = c.

## 50. Question

$$\left| \begin{array}{ccc} p & b & c \\ a & q & c \\ a & b & r \end{array} \right| = 0, \mbox{ find the value of } \frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c}, p \neq a, q = b, r \neq c \,.$$

## Answer

 $\operatorname{Let} \Delta = \begin{vmatrix} p & b & c \\ a & q & c \\ a & b & r \end{vmatrix}$ 

Given that  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

**CLICK HERE** 

Applying  $R_1 \rightarrow R_1 - R_2$ , we get

$$\Delta = \begin{vmatrix} p-a & b-q & c-c \\ a & q & c \\ a & b & r \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} p-a & b-q & 0 \\ a & q & c \\ a & b & r \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_3$ , we get

$$\Delta = \begin{vmatrix} p-a & b-q & 0 \\ a-a & q-b & c-r \\ a & b & r \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} p-a & b-q & 0 \\ 0 & q-b & c-r \\ a & b & r \end{vmatrix}$$

Expanding the determinant along  $R_1$ , we have

 $\Delta = (p - a)[(q - b)(r) - (b)(c - r)] - (b - q)[-a(c - r)]$  $\Rightarrow \Delta = r(p - a)(q - b) - b(p - a)(c - r) + a(b - q)(c - r)$  $\therefore \Delta = r(p-a)(q-b) + b(p-a)(r-c) + a(q-b)(r-c)$ We have  $\Delta = 0$  $\Rightarrow r(p - a)(q - b) + b(p - a)(r - c) + a(q - b)(r - c) = 0$ On dividing the equation with (p - a)(q - b)(r - c), we get  $\frac{r(p-a)(q-b)+b(p-a)(r-c)+a(q-b)(r-c)}{(p-a)(q-b)(r-c)}=0$  $\Rightarrow \frac{r}{r-c} + \frac{b}{q-b} + \frac{a}{p-a} = 0$  $\Rightarrow \frac{r}{r-c} + \frac{b-q+q}{q-b} + \frac{a-p+p}{p-a} = 0$  $\Rightarrow \frac{r}{r-c} + \frac{b-q}{q-b} + \frac{q}{q-b} + \frac{a-p}{p-a} + \frac{p}{p-a} = 0$  $\Rightarrow \frac{r}{r-c} + (-1) + \frac{q}{q-b} + (-1) + \frac{p}{p-a} = 0$  $\Rightarrow \frac{r}{r-c} + (-1) + \frac{q}{q-b} + (-1) + \frac{p}{p-a} = 0$  $\Rightarrow \frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c} - 2 = 0$  $\therefore \frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c} = 2$ Thus,  $\frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c} = 2$ 

51. Question

Show that x = 2 is a root of the equation 
$$\begin{vmatrix} x & -6 & -1 \\ 2 & -3x & x-3 \\ -3 & 2x & x+2 \end{vmatrix} = 0$$
 and solve it completely.

#### Answer

Get More Learning Materials Here : 📕

## R www.studentbro.in

Let 
$$\Delta = \begin{vmatrix} x & -6 & -1 \\ 2 & -3x & x-3 \\ -3 & 2x & x+2 \end{vmatrix}$$

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying 
$$R_2 \rightarrow R_2 - R_1$$
, we get

$$\Delta = \begin{vmatrix} x & -6 & -1 \\ 2 - x & -3x - (-6) & x - 3 - (-1) \\ -3 & 2x & x + 2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} x & -6 & -1 \\ 2 - x & -3x + 6 & x - 2 \\ -3 & 2x & x + 2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} x & -6 & -1 \\ -(x - 2) & -3(x - 2) & x - 2 \\ -3 & 2x & x + 2 \end{vmatrix}$$

Taking the term (x - 2) common from  $R_2$ , we get

$$\Delta = (x-2) \begin{vmatrix} x & -6 & -1 \\ -1 & -3 & 1 \\ -3 & 2x & x+2 \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (x-2) \begin{vmatrix} x & -6 & -1 \\ -1 & -3 & 1 \\ -3-x & 2x - (-6) & x+2 - (-1) \end{vmatrix}$$
$$\Rightarrow \Delta = (x-2) \begin{vmatrix} x & -6 & -1 \\ -1 & -3 & 1 \\ -x-3 & 2x+6 & x+3 \end{vmatrix}$$
$$\Rightarrow \Delta = (x-2) \begin{vmatrix} x & -6 & -1 \\ -1 & -3 & 1 \\ -(x+3) & 2(x+3) & x+3 \end{vmatrix}$$

Taking the term (x + 3) common from  $R_3$ , we get

$$\Delta = (x-2)(x+3) \begin{vmatrix} x & -6 & -1 \\ -1 & -3 & 1 \\ -1 & 2 & 1 \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

$$\Delta = (x-2)(x+3) \begin{vmatrix} x+(-1) & -6 & -1 \\ -1+1 & -3 & 1 \\ -1+1 & 2 & 1 \end{vmatrix}$$
$$\Rightarrow \Delta = (x-2)(x+3) \begin{vmatrix} x-1 & -6 & -1 \\ 0 & -3 & 1 \\ 0 & 2 & 1 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{C}_1,$  we have

$$\Delta = (x - 2)(x + 3)(x - 1)[(-3)(1) - (2)(1)]$$
  

$$\Rightarrow \Delta = (x - 2)(x + 3)(x - 1)(-5)$$
  

$$\therefore \Delta = -5(x - 2)(x + 3)(x - 1)$$
  
The given equation is  $\Delta = 0$ .  

$$\Rightarrow -5(x - 2)(x + 3)(x - 1) = 0$$

 $\Rightarrow (x - 2)(x + 3)(x - 1) = 0$  Case - 1:  $x - 2 = 0 \Rightarrow x = 2$  Case - 11:  $x + 2 = 0 \Rightarrow x = -3$  Case - 11:  $x - 1 = 0 \Rightarrow x = 1$ Thus, 2 is a root of the equation  $\begin{vmatrix} x & -6 & -1 \\ 2 & -3x & x - 3 \\ -3 & 2x & x + 2 \end{vmatrix} = 0 and its other roots are -3 and 1.$ 

## 52 A. Question

Solve the following determinant equations:

$$\begin{vmatrix} x+a & b & c \\ a & x+b & c \\ a & b & x+c \end{vmatrix} = 0$$

#### Answer

 $\begin{vmatrix} x+a & b & c \\ a & x+b & c \\ a & b & x+c \end{vmatrix} = 0$ 

Let 
$$\Delta = \begin{vmatrix} x+a & b & c \\ a & x+b & c \\ a & b & x+c \end{vmatrix}$$

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

Δ =	x + a + b	b	c
	a + (x + b)	x + b	c
	a + b	b	x+c
⇒Δ	$= \begin{vmatrix} x+a+b \\ x+a+b \\ a+b \end{vmatrix}$	b x + b b	c c x + c

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

$$\Delta = \begin{vmatrix} x+a+b+c & b & c \\ x+a+b+c & x+b & c \\ a+b+(x+c) & b & x+c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} x+a+b+c & b & c \\ x+a+b+c & x+b & c \\ x+a+b+c & b & x+c \end{vmatrix}$$

Taking the term (x + a + b + c) common from C<sub>1</sub>, we get

$$\Delta = (x + a + b + c) \begin{vmatrix} 1 & b & c \\ 1 & x + b & c \\ 1 & b & x + c \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = (x + a + b + c) \begin{vmatrix} 1 & b & c \\ 1 - 1 & x + b - b & c - c \\ 1 & b & x + c \end{vmatrix}$$
$$\Rightarrow \Delta = (x + a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & x & 0 \\ 1 & b & x + c \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (x + a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & x & 0 \\ 1 - 1 & b - b & x + c - c \end{vmatrix}$$
$$\Rightarrow \Delta = (x + a + b + c) \begin{vmatrix} 1 & b & c \\ 0 & x & 0 \\ 0 & 0 & x \end{vmatrix}$$

Expanding the determinant along  $C_1$ , we have

 $\Delta = (x + a + b + c)(1)[(x)(x) - (0)(0)]$ 

 $\Rightarrow \Delta = (x + a + b + c)(x)(x)$ 

$$\therefore \Delta = x^2(x + a + b + c)$$

The given equation is  $\Delta = 0$ .

 $\Rightarrow x^2(x + a + b + c) = 0$ 

<u>Case – I</u>:

 $x^2 = 0 \Rightarrow x = 0$ 

Case - II:

 $x + a + b + c = 0 \Rightarrow x = -(a + b + c)$ 

Thus, 0 and -(a + b + c) are the roots of the given determinant equation.

#### 52 B. Question

Solve the following determinant equations:

$$\begin{vmatrix} x+a & x & x \\ x & x+a & x \\ x & x & x+a \end{vmatrix} = 0, a \neq 0$$

#### Answer

 $\begin{vmatrix} x+a & x & x \\ x & x+a & x \\ x & x & x+a \end{vmatrix} = 0, a \neq 0$ Let  $\Delta = \begin{vmatrix} x+a & x & x \\ x & x+a & x \\ x & x & x+a \end{vmatrix}$ 

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

 $\Delta = \begin{vmatrix} x+a+x & x & x \\ x+(x+a) & x+a & x \\ x+x & x & x+a \end{vmatrix}$ 

$$\Rightarrow \Delta = \begin{vmatrix} 2x + a & x & x \\ 2x + a & x + a & x \\ 2x & x & x + a \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

 $\Delta = \begin{vmatrix} 2x + a + x & x & x \\ 2x + a + x & x + a & x \\ 2x + (x + a) & x & x + a \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 3x + a & x & x \\ 3x + a & x + a & x \\ 3x + a & x & x + a \end{vmatrix}$ 

Taking the term (3x + a) common from C<sub>1</sub>, we get

$$\Delta = (3x+a) \begin{vmatrix} 1 & x & x \\ 1 & x+a & x \\ 1 & x & x+a \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = (3x+a) \begin{vmatrix} 1 & x & x \\ 1-1 & x+a-x & x-x \\ 1 & x & x+a \end{vmatrix}$$
$$\Rightarrow \Delta = (3x+a) \begin{vmatrix} 1 & x & x \\ 0 & a & 0 \\ 1 & x & x+a \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (3x + a) \begin{vmatrix} 1 & x & x \\ 0 & a & 0 \\ 1 - 1 & x - x & x + a - x \end{vmatrix}$$
$$\Rightarrow \Delta = (3x + a) \begin{vmatrix} 1 & x & x \\ 0 & a & 0 \\ 0 & 0 & a \end{vmatrix}$$

Expanding the determinant along  $C_1$ , we have

$$\Delta = (3x + a)(1)[(a)(a) - (0)(0)]$$

 $\Rightarrow \Delta = (3x + a)(a)(a)$ 

$$\therefore \Delta = a^2(3x + a)$$

The given equation is  $\Delta = 0$ .

$$\Rightarrow a^2(3x + a) = 0$$

However, a  $\neq$  0 according to the given condition.

$$\Rightarrow$$
 3x + a = 0

⇒ 3x = -a

$$\therefore x = -\frac{a}{3}$$

Thus,  $-\frac{a}{3}$  is the root of the given determinant equation.

## 52 C. Question

Solve the following determinant equations:

$$\begin{vmatrix} 3x - 8 & 3 & 3 \\ 3 & 3x - 8 & 3 \\ 3 & 3 & 3x - 8 \end{vmatrix} = 0$$

#### Answer

	3x – 8	3 3x - 8 3	3	
	3	3x - 8	3	= 0
	3	3	3x – 8l	
I	Let <u>∆</u> =	3x - 8 3 3	3 3x - 8	3 3 3x - 8
		3	3	3x - 8

We need to find the roots of 
$$\Delta = 0$$
.

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

$$\Delta = \begin{vmatrix} 3x - 8 + 3 & 3 & 3 \\ 3 + (3x - 8) & 3x - 8 & 3 \\ 3 + 3 & 3 & 3x - 8 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 3x - 5 & 3 & 3 \\ 3x - 5 & 3x - 8 & 3 \\ 6 & 3 & 3x - 8 \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

$$\Delta = \begin{vmatrix} 3x - 5 + 3 & 3 & 3 \\ 3x - 5 + 3 & 3x - 8 & 3 \\ 6 + (3x - 8) & 3 & 3x - 8 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 3x - 2 & 3 & 3 \\ 3x - 2 & 3x - 8 & 3 \\ 3x - 2 & 3 & 3x - 8 \end{vmatrix}$$

Taking the term (3x - 2) common from  $C_1$ , we get

$$\Delta = (3x - 2) \begin{vmatrix} 1 & 3 & 3 \\ 1 & 3x - 8 & 3 \\ 1 & 3 & 3x - 8 \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = (3x - 2) \begin{vmatrix} 1 & 3 & 3 \\ 1 - 1 & 3x - 8 - 3 & 3 - 3 \\ 1 & 3 & 3x - 8 \end{vmatrix}$$
$$\Rightarrow \Delta = (3x - 2) \begin{vmatrix} 1 & 3 & 3 \\ 0 & 3x - 11 & 0 \\ 1 & 3 & 3x - 8 \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (3x - 2) \begin{vmatrix} 1 & 3 & 3 \\ 0 & 3x - 11 & 0 \\ 1 - 1 & 3 - 3 & 3x - 8 - 3 \end{vmatrix}$$
$$\Rightarrow \Delta = (3x - 2) \begin{vmatrix} 1 & 3 & 3 \\ 0 & 3x - 11 & 0 \\ 0 & 0 & 3x - 11 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{C}_1,$  we have

$$\Delta = (3x - 2)(1)[(3x - 11)(3x - 11) - (0)(0)]$$

 $\Rightarrow \Delta = (3x - 2)(3x - 11)(3x - 11)$   $\therefore \Delta = (3x - 2)(3x - 11)^{2}$ The given equation is  $\Delta = 0$ .  $\Rightarrow (3x - 2)(3x - 11)^{2} = 0$  Case - I: 3x - 2 = 0  $\Rightarrow 3x = 2$   $\therefore x = \frac{2}{3}$  Case - II:  $(3x - 11)^{2} = 0$   $\Rightarrow 3x - 11 = 0$   $\Rightarrow 3x = 11$  $\therefore x = \frac{11}{3}$ 

Thus,  $\frac{2}{3}$  and  $\frac{11}{3}$  are the roots of the given determinant equation.

## 52 D. Question

Solve the following determinant equations:

$$\begin{vmatrix} 1 & x & x^{2} \\ 1 & a & a^{2} \\ 1 & b & b^{2} \end{vmatrix} = 0, a \neq b$$

## Answer

$$\begin{vmatrix} 1 & x & x^{2} \\ 1 & a & a^{2} \\ 1 & b & b^{2} \end{vmatrix} = 0, a \neq b$$
  
Let  $\Delta = \begin{vmatrix} 1 & x & x^{2} \\ 1 & a & a^{2} \\ 1 & b & b^{2} \end{vmatrix}$ 

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = \begin{vmatrix} 1 & x & x^{2} \\ 1 - 1 & a - x & a^{2} - x^{2} \\ 1 & b & b^{2} \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & x & x^{2} \\ 0 & a - x & a^{2} - x^{2} \\ 1 & b & b^{2} \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = \begin{vmatrix} 1 & x & x^{2} \\ 0 & a - x & a^{2} - x^{2} \\ 1 - 1 & b - x & b^{2} - x^{2} \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & x & x^{2} \\ 0 & a - x & a^{2} - x^{2} \\ 0 & b - x & b^{2} - x^{2} \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & x & x^{2} \\ 0 & a - x & (a - x)(a + x) \\ 0 & b - x & (b - x)(b + x) \end{vmatrix}$$

Taking (a - x) and (b - x) common from  $R_2$  and  $R_3$ , we get

$$\Delta = (a - x)(b - x) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1 & a + x \\ 0 & 1 & b + x \end{vmatrix}$$

Expanding the determinant along  $C_1$ , we have

$$\Delta = (a - x)(b - x)(1)[(1)(b + x) - (1)(a + x)]$$
  

$$\Rightarrow \Delta = (a - x)(b - x)[b + x - a - x]$$
  

$$\therefore \Delta = (a - x)(b - x)(b - a)$$
  
The given equation is  $\Delta = 0$ .  

$$\Rightarrow (a - x)(b - x)(b - a) = 0$$
  
However,  $a \neq b$  according to the given condition.  

$$\Rightarrow (a - x)(b - x) = 0$$
  
Case - 1:  
 $a - x = 0 \Rightarrow x = a$   
Case - 1:

 $b - x = 0 \Rightarrow x = b$ 

Thus, a and b are the roots of the given determinant equation.

#### 52 E. Question

Solve the following determinant equations:

$$\begin{vmatrix} x+1 & 3 & 5 \\ 2 & x+2 & 5 \\ 2 & 3 & x+4 \end{vmatrix} = 0$$

#### Answer

 $\begin{vmatrix} x+1 & 3 & 5 \\ 2 & x+2 & 5 \\ 2 & 3 & x+4 \end{vmatrix} = 0$ Let  $\Delta = \begin{vmatrix} x+1 & 3 & 5 \\ 2 & x+2 & 5 \\ 2 & 3 & x+4 \end{vmatrix}$ 

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

 $\Delta = \begin{vmatrix} x+1+3 & 3 & 5\\ 2+(x+2) & x+2 & 5\\ 2+3 & 3 & x+4 \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} x+4 & 3 & 5\\ x+4 & x+2 & 5\\ 5 & 3 & x+4 \end{vmatrix}$ 

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

$$\Delta = \begin{vmatrix} x+4+5 & 3 & 5 \\ x+4+5 & x+2 & 5 \\ 5+(x+4) & 3 & x+4 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} x+9 & 3 & 5 \\ x+9 & x+2 & 5 \\ x+9 & 3 & x+4 \end{vmatrix}$$

Taking the term (x + 9) common from C<sub>1</sub>, we get

$$\Delta = (x+9) \begin{vmatrix} 1 & 3 & 5 \\ 1 & x+2 & 5 \\ 1 & 3 & x+4 \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = (x+9) \begin{vmatrix} 1 & 3 & 5 \\ 1-1 & x+2-3 & 5-5 \\ 1 & 3 & x+4 \end{vmatrix}$$
$$\Rightarrow \Delta = (x+9) \begin{vmatrix} 1 & 3 & 5 \\ 0 & x-1 & 0 \\ 1 & 3 & x+4 \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (x+9) \begin{vmatrix} 1 & 3 & 5 \\ 0 & x-1 & 0 \\ 1-1 & 3-3 & x+4-5 \end{vmatrix}$$
$$\Rightarrow \Delta = (x+9) \begin{vmatrix} 1 & 3 & 5 \\ 0 & x-1 & 0 \\ 0 & 0 & x-1 \end{vmatrix}$$

Expanding the determinant along  $C_1$ , we have

$$\Delta = (x + 9)(1)[(x - 1)(x - 1) - (0)(0)]$$
  

$$\Rightarrow \Delta = (x + 9)(x - 1)(x - 1)$$
  

$$\therefore \Delta = (x + 9)(x - 1)^{2}$$
  
The given equation is  $\Delta = 0$ .  

$$\Rightarrow x^{2}(x + a + b + c) = 0$$
  
Case - 1:  

$$x + 9 = 0 \Rightarrow x = -9$$
  
Case - 11:  

$$(x - 1)^{2} = 0$$
  

$$\Rightarrow x - 1 = 0$$
  

$$\therefore x = 1$$

Thus, -9 and 1 are the roots of the given determinant equation.

#### 52 F. Question

Solve the following determinant equations:

 $\begin{vmatrix} 1 & x & x^{3} \\ 1 & b & b^{3} \\ 1 & c & c^{3} \end{vmatrix} = 0, b \neq c$ 

#### Answer

 $\begin{vmatrix} 1 & x & x^{3} \\ 1 & b & b^{3} \\ 1 & c & c^{3} \end{vmatrix} = 0, b \neq c$ Let  $\Delta = \begin{vmatrix} 1 & x & x^{3} \\ 1 & b & b^{3} \\ 1 & c & c^{3} \end{vmatrix}$ 

## We need to find the roots of $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

 $\Delta = \begin{vmatrix} 1 & x & x^{3} \\ 1 - 1 & b - x & b^{3} - x^{3} \\ 1 & c & c^{3} \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 1 & x & x^{3} \\ 0 & b - x & b^{3} - x^{3} \\ 1 & c & c^{3} \end{vmatrix}$ 

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\begin{split} \Delta &= \begin{vmatrix} 1 & x & x^{3} \\ 0 & b-x & b^{3}-x^{3} \\ 1-1 & c-x & c^{3}-x^{3} \end{vmatrix} \\ \Rightarrow \Delta &= \begin{vmatrix} 1 & x & x^{3} \\ 0 & b-x & b^{3}-x^{3} \\ 0 & c-x & c^{3}-x^{3} \end{vmatrix} \\ \Rightarrow \Delta &= \begin{vmatrix} 1 & x & x^{3} \\ 0 & b-x & (b-x)(b^{2}+bx+x^{2}) \\ 0 & c-x & (c-x)(c^{2}+cx+x^{2}) \end{vmatrix}$$

Taking (b – x) and (c – x) common from  $R_2$  and  $R_3$ , we get

$$\Delta = (b-x)(c-x) \begin{vmatrix} 1 & x & x^3 \\ 0 & 1 & b^2 + bx + x^2 \\ 0 & 1 & c^2 + cx + x^2 \end{vmatrix}$$

Expanding the determinant along  $C_1$ , we have

$$\Delta = (b - x)(c - x)(1)[(1)(c^{2} + cx + x^{2}) - (1)(b^{2} + bx + x^{2})]$$
  

$$\Rightarrow \Delta = (b - x)(c - x)[c^{2} + cx + x^{2} - b^{2} - bx - x^{2}]$$
  

$$\Rightarrow \Delta = (b - x)(c - x)[c^{2} - b^{2} + cx - bx]$$
  

$$\Rightarrow \Delta = (b - x)(c - x)[(c - b)(c + b) + (c - b)x]$$
  

$$\therefore \Delta = (b - x)(c - x)(c - b)(c + b + x)$$

The given equation is  $\Delta = 0$ .

 $\Rightarrow (b - x)(c - x)(c - b)(c + b + x) = 0$ 

However, b  $\neq$  c according to the given condition.

```
\Rightarrow (b - x)(c - x)(c + b + x) = 0
<u>Case - 1</u>:

b - x = 0 \Rightarrow x = b
<u>Case - 11</u>:

c - x = 0 \Rightarrow x = c
<u>Case - 111</u>:

c + b + x = 0 \Rightarrow x = -(b + c)
```

Thus, b, c and -(b + c) are the roots of the given determinant equation.

## 52 G. Question

Solve the following determinant equations:

15 –	2x 11-	-3x 7-	- X
11	17 16	14	= 0
10	16	13	

#### Answer

15 – 2x	11 - 3x 17 16	7 – x	
11	17	14	= 0
l 10	16	13 I	
Let <u>∧</u> =	15 – 2x 11 10	11 - 3x 17 16	7 - x 14 13

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $R_2 \rightarrow R_2 - R_3$ , we get

$\Delta = \begin{vmatrix} 15\\11 \end{vmatrix}$	5 - 2x - 10 10	11 - 3x 17 - 16 16	$\begin{array}{c c} 7-x \\ 14-13 \\ 13 \end{array}$
⇒Δ=	15 — 2: 1 10	x 11 – 3 1 16	$ \begin{array}{c} x & 7-x \\ 1 \\ 13 \end{array} $

Applying  $C_2 \rightarrow C_2 - C_1$ , we get

	15 – 2x	11 - 3x - (15 - 2x)  1 - 1  16 - 10	7 – x
Δ =	1	1 - 1	1
	10	16 - 10	13 I
	15 – 2	x - 4 - x - 7 - x	

```
\Rightarrow \Delta = \begin{vmatrix} 1 & 0 & 1 \\ 10 & 6 & 13 \end{vmatrix}
```

Applying  $C_3 \rightarrow C_3 - C_1$ , we get

$$\Delta = \begin{vmatrix} 15 - 2x & -4 - x & 7 - x - (15 - 2x) \\ 1 & 0 & 1 - 1 \\ 10 & 6 & 13 - 10 \end{vmatrix}$$

$$\Rightarrow \Delta = \begin{vmatrix} 15 - 2x & -4 - x & x - 8 \\ 1 & 0 & 0 \\ 10 & 6 & 3 \end{vmatrix}$$

Expanding the determinant along  $R_2$ , we have

 $\Delta = -(1)[(-4 - x)(3) - (6)(x - 8)]$   $\Rightarrow \Delta = -[-12 - 3x - 6x + 48]$   $\Rightarrow \Delta = -[-9x + 36]$   $\therefore \Delta = 9x - 36$ The given equation is  $\Delta = 0$ .  $\Rightarrow 9x - 36 = 0$  $\Rightarrow 9x = 36$ 

 $\therefore x = 4$ 

Thus, 4 is the root of the given determinant equation.

#### 52 H. Question

Solve the following determinant equations:

 $\begin{vmatrix} 1 & 1 & x \\ p+1 & p+1 & p+x \\ 3 & x+1 & x+2 \end{vmatrix} = 0$ 

#### Answer

 $\begin{vmatrix} 1 & 1 & x \\ p+1 & p+1 & p+x \\ 3 & x+1 & x+2 \end{vmatrix} = 0$ Let  $\Delta = \begin{vmatrix} 1 & 1 & x \\ p+1 & p+1 & p+x \\ 3 & x+1 & x+2 \end{vmatrix}$ 

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_i$  or  $C_i \rightarrow C_i + kC_i$ .

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = \begin{vmatrix} 1 & 1 & x \\ p + 1 - 1 & p + 1 - 1 & p + x - x \\ 3 & x + 1 & x + 2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & 1 & x \\ p & p & p \\ 3 & x + 1 & x + 2 \end{vmatrix}$$

Taking the term  $p\ common\ from\ R_2,$  we get

$$\Delta = p \begin{vmatrix} 1 & 1 & x \\ 1 & 1 & 1 \\ 3 & x+1 & x+2 \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 - C_2$ , we get

$$\Delta = p \begin{vmatrix} 1-1 & 1 & x \\ 1-1 & 1 & 1 \\ 3-(x+1) & x+1 & x+2 \end{vmatrix}$$

Get More Learning Materials Here :

# R www.studentbro.in

$$\Rightarrow \Delta = p \begin{vmatrix} 0 & 1 & x \\ 0 & 1 & 1 \\ 2 - x & x + 1 & x + 2 \end{vmatrix}$$

Expanding the determinant along  $\mathrm{C}_{1},$  we have

 $\Delta = p(2 - x)[(1)(1) - (1)(x)]$ 

 $\therefore \Delta = p(2 - x)(1 - x)$ 

The given equation is  $\Delta = 0$ .

 $\Rightarrow p(2 - x)(1 - x) = 0$ 

Assuming  $p \neq 0$ , we get

 $\Rightarrow (2 - x)(1 - x) = 0$ 

<u>Case - I</u>:

```
2 - x = 0 \Rightarrow x = 2
```

<u>Case - II</u>:

 $1 - x = 0 \Rightarrow x = 1$ 

Thus, 1 and 2 are the roots of the given determinant equation.

## 52 I. Question

Solve the following determinant equations:

 $\begin{vmatrix} 3 & -2 & \sin 3\theta \\ -7 & 8 & \cos 2\theta \\ -11 & 14 & 2 \end{vmatrix} = 0$ 

#### Answer

$$\begin{vmatrix} 3 & -2 & \sin 3\theta \\ -7 & 8 & \cos 2\theta \\ -11 & 14 & 2 \end{vmatrix} = 0$$
  
Let  $\Delta = \begin{vmatrix} 3 & -2 & \sin 3\theta \\ -7 & 8 & \cos 2\theta \\ -11 & 14 & 2 \end{vmatrix}$ 

We need to find the roots of  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

$$\Delta = \begin{vmatrix} 3 + (-2) & -2 & \sin 3\theta \\ -7 + 8 & 8 & \cos 2\theta \\ -11 + 14 & 14 & 2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & -2 & \sin 3\theta \\ 1 & 8 & \cos 2\theta \\ 3 & 14 & 2 \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = \begin{vmatrix} 1 & -2 & \sin 3\theta \\ 1 - 1 & 8 - (-2) & \cos 2\theta - \sin 3\theta \\ 3 & 14 & 2 \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} 1 & -2 & \sin 3\theta \\ 0 & 10 & \cos 2\theta - \sin 3\theta \\ 3 & 14 & 2 \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - 3R_1$ , we get

 $\Delta = \begin{vmatrix} 1 & -2 & \sin 3\theta \\ 0 & 10 & \cos 2\theta - \sin 3\theta \\ 3 - 3(1) & 14 - 3(-2) & 2 - 3(\sin 3\theta) \end{vmatrix}$  $\Rightarrow \Delta = \begin{vmatrix} 1 & -2 & \sin 3\theta \\ 0 & 10 & \cos 2\theta - \sin 3\theta \\ 0 & 20 & 2 - 3\sin 3\theta \end{vmatrix}$ Expanding the determinant along  $C_1$ , we have  $\Delta = (1)[(10)(2 - 3\sin(3\theta)) - (20)(\cos(2\theta) - \sin(3\theta))]$  $\Rightarrow \Delta = [20 - 30\sin(3\theta) - 20\cos(2\theta) + 20\sin(3\theta)]$  $\Rightarrow \Delta = 20 - 10\sin(3\theta) - 20\cos(2\theta)$ From trigonometry, we have  $sin(3\theta) = 3sin\theta - 4sin^3\theta$  and  $cos(2\theta) = 1 - 2sin^2\theta$ .  $\Rightarrow \Delta = 20 - 10(3\sin\theta - 4\sin^3\theta) - 20(1 - 2\sin^2\theta)$  $\Rightarrow \Delta = 20 - 30 \sin\theta + 40 \sin^3\theta - 20 + 40 \sin^2\theta$  $\Rightarrow \Delta = -30 \sin\theta + 40 \sin^2\theta + 40 \sin^3\theta$  $\therefore \Delta = 10(\sin\theta)(-3 + 4\sin\theta + 4\sin^2\theta)$ The given equation is  $\Delta = 0$ .  $\Rightarrow$  10(sin $\theta$ )(-3 + 4sin $\theta$  + 4sin<sup>2</sup> $\theta$ ) = 0  $\Rightarrow (\sin\theta)(-3 + 4\sin\theta + 4\sin^2\theta) = 0$ Case - I:  $\sin \theta = 0 \Rightarrow \theta = k\pi$ , where  $k \in Z$ Case - II:  $-3 + 4\sin\theta + 4\sin^2\theta = 0$  $\Rightarrow 4\sin^2\theta + 4\sin\theta - 3 = 0$  $\Rightarrow 4\sin^2\theta + 6\sin\theta - 2\sin\theta - 3 = 0$  $\Rightarrow 2\sin\theta(2\sin\theta + 3) - 1(2\sin\theta + 3) = 0$  $\Rightarrow (2\sin\theta - 1)(2\sin\theta + 3) = 0$  $\Rightarrow 2\sin\theta - 1 = 0 \text{ or } 2\sin\theta + 3 = 0$  $\Rightarrow 2\sin\theta = 1 \text{ or } 2\sin\theta = -3$  $\Rightarrow \sin\theta = \frac{1}{2} \text{ or } \sin\theta = -\frac{3}{2}$ However,  $\sin \theta \neq -\frac{3}{2}$  as  $-1 \leq \sin \theta \leq 1$ .  $\Rightarrow \sin\theta = \frac{1}{2} = \sin\frac{\pi}{6}$  $\therefore \theta = k\pi + (-1)^k \frac{\pi}{6}$ , where k  $\in \mathbb{Z}$ Thus,  $k\pi$  and  $k\pi + (-1)k\frac{\pi}{6}$  for all integral values of k are the roots of the given determinant equation.

#### 53. Question

If a, b and c are all non-zero and 
$$\begin{vmatrix} 1+a & 1 & 1\\ 1 & 1+b & 1\\ 1 & 1 & 1+c \end{vmatrix} = 0$$
, then prove that  $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + 1 = 0$ .

Answer

Let  $\Delta = \begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1 & 1+c \end{vmatrix}$ 

Given that  $\Delta = 0$ .

We can write the determinant  $\boldsymbol{\Delta}$  as

$$\Delta = \begin{vmatrix} a\left(\frac{1}{a}+1\right) & b\left(\frac{1}{b}\right) & c\left(\frac{1}{c}\right) \\ a\left(\frac{1}{a}\right) & b\left(\frac{1}{b}+1\right) & c\left(\frac{1}{c}\right) \\ a\left(\frac{1}{a}\right) & b\left(\frac{1}{b}\right) & c\left(\frac{1}{c}+1\right) \end{vmatrix}$$

Taking a, b and c common from  $\mathsf{C}_1,\,\mathsf{C}_2$  and  $\mathsf{C}_3,$  we get

$$\Rightarrow \Delta = (abc) \begin{vmatrix} 1 + \frac{1}{a} & \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} & 1 + \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_j$  or  $C_i \rightarrow C_i + kC_j$ .

Applying  $C_1 \rightarrow C_1 + C_2$ , we get

$$\Delta = (abc) \begin{vmatrix} 1 + \frac{1}{a} + \frac{1}{b} & \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} + \left(1 + \frac{1}{b}\right) & 1 + \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} + \frac{1}{b} & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$
$$\Rightarrow \Delta = (abc) \begin{vmatrix} 1 + \frac{1}{a} + \frac{1}{b} & \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} & \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} & 1 + \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} + \frac{1}{b} & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 + C_3$ , we get

$$\Delta = (abc) \begin{vmatrix} 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & 1 + \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} + \frac{1}{b} + \left(1 + \frac{1}{c}\right) & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$
$$\Rightarrow \Delta = (abc) \begin{vmatrix} 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & 1 + \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & 1 + \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$

Taking  $1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}$  common from C<sub>1</sub>, we get

$$\Delta = (abc)\left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 1 & 1 + \frac{1}{b} & \frac{1}{c} \\ 1 & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = (abc)\left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 1 - 1 & 1 + \frac{1}{b} - \frac{1}{b} & \frac{1}{c} - \frac{1}{c} \\ 1 & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$
$$\Rightarrow \Delta = (abc)\left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 0 & 1 & 0 \\ 1 & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = (abc) \left( 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 0 & 1 & 0 \\ 1 - 1 & \frac{1}{b} - \frac{1}{b} & 1 + \frac{1}{c} - \frac{1}{c} \end{vmatrix}$$
$$\Rightarrow \Delta = (abc) \left( 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

Expanding the determinant along  $\mathsf{C}_1,$  we have

$$\Delta = (abc) \left( 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) (1) [(1)(1) - 0]$$
  
$$\therefore \Delta = (abc) \left( 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right)$$

We have  $\Delta = 0$ .

$$\Rightarrow (abc)\left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) = 0$$

It is given that a, b and c are all non-zero.

$$\therefore 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} = 0$$

Thus,  $1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} = 0$  when  $\begin{vmatrix} 1+a & 1 & 1\\ 1 & 1+b & 1\\ 1 & 1 + c \end{vmatrix} = 0$  and a, b, c are all non-zero.

## 54. Question

 $\left| \begin{array}{ccc} a & b-y & c-z \\ a-x & b & c-z \\ a-x & b-y & c \end{array} \right| = 0, \ \text{then using properties of determinants, find the value of } \frac{a}{x} + \frac{b}{y} + \frac{c}{z}, \ \text{where }$ 

 $x, y, z \neq 0.$ 

#### Answer

Let 
$$\Delta = \begin{vmatrix} a & b-y & c-z \\ a-x & b & c-z \\ a-x & b-y & c \end{vmatrix}$$

Given that  $\Delta = 0$ .

Recall that the value of a determinant remains same if we apply the operation  $R_i \rightarrow R_i + kR_i$  or  $C_i \rightarrow C_i + kC_i$ .

Applying  $R_2 \rightarrow R_2 - R_1$ , we get

$$\Delta = \begin{vmatrix} a & b - y & c - z \\ a - x - a & b - (b - y) & c - z - (c - z) \\ a - x & b - y & c \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a & b - y & c - z \\ -x & y & 0 \\ a - x & b - y & c \end{vmatrix}$$

Applying  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Delta = \begin{vmatrix} a & b - y & c - z \\ -x & y & 0 \\ a - x - a & b - y - (b - y) & c - (c - z) \end{vmatrix}$$
$$\Rightarrow \Delta = \begin{vmatrix} a & b - y & c - z \\ -x & y & 0 \\ -x & 0 & z \end{vmatrix}$$

Expanding the determinant along  $C_3$ , we have

```
\Rightarrow \Delta = (c - z)[0 - (-x)(y)] - 0 + z[(a)(y) - (-x)(b - y)]

\Rightarrow \Delta = (c - z)(xy) + z[ay + xb - xy]

\Rightarrow \Delta = cxy - xyz + ayz + bxz - xyz

\therefore \Delta = ayz + bxz + cxy - 2xyz

We have \Delta = 0

\Rightarrow ayz + bxz + cxy - 2xyz = 0

\Rightarrow ayz + bxz + cxy = 2xyz

\Rightarrow \frac{ayz + bxz + cxy}{xyz} = 2

\Rightarrow \frac{ayz}{xyz} + \frac{bxz}{xyz} + \frac{cxy}{xyz} = 2

\Rightarrow \frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 2

Thus, \frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 2 when \begin{vmatrix} a & b - y & c - z \\ a - x & b & c - z \\ a - x & b - y & c \end{vmatrix} = 0.
```

# Exercise 6.3

## **1 A. Question**

Find the area of the triangle with vertices at the points:

(3, 8), (-4, 2) and (5, -1)

#### Answer

Given: - Vertices of the triangle:

(3, 8), (- 4, 2) and (5, - 1)

We know that,

If vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now, substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 3 & 8 & 1 \\ -4 & 2 & 1 \\ 5 & -1 & 1 \end{vmatrix}$$

Expanding along  $R_1$ 

$$= \frac{1}{2} \begin{bmatrix} 3 \begin{vmatrix} 2 & 1 \\ -1 & 1 \end{vmatrix} - 8 \begin{vmatrix} -4 & 1 \\ 5 & 1 \end{vmatrix} + 1 \begin{vmatrix} -4 & 2 \\ 5 & -1 \end{vmatrix} \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 3(3) - 8(-9) + 1(-6) \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 9 + 72 - 6 \end{bmatrix}$$
$$= \frac{75}{2} \text{ sq.units}$$

Thus area of triangle is  $\frac{75}{2}$  sq.units

#### **1 B. Question**

Find the area of the triangle with vertices at the points:

(2, 7) (1, 1) and (10, 8)

#### Answer

Given: - Vertices of the triangle:

(2, 7) (1, 1) and (10, 8)

We know that,

If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now, substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 2 & 7 & 1 \\ 1 & 1 & 1 \\ 10 & 8 & 1 \end{vmatrix}$$

Expanding along R<sub>1</sub>

$$= \frac{1}{2} \begin{bmatrix} 2 \begin{vmatrix} 1 & 1 \\ 8 & 1 \end{vmatrix} - 7 \begin{vmatrix} 1 & 1 \\ 10 & 1 \end{vmatrix} + 1 \begin{vmatrix} 1 & 1 \\ 10 & 8 \end{vmatrix} \end{bmatrix}$$

$$= \frac{1}{2} [2(-7) - 7(-9) + 1(-2)]$$
$$= \frac{1}{2} [-14 + 63 - 2]$$
$$= \frac{47}{2} \text{ sq.units}$$

Thus area of triangle is  $\frac{47}{2}$  sq.units

#### 1 C. Question

Find the area of the triangle with vertices at the points:

(-1, -8), (-2, -3) and (3, 2)

#### Answer

Given: - Vertices of the triangle:

We know that,

If vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now, substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} -1 & -8 & 1 \\ -2 & -3 & 1 \\ 3 & 2 & 1 \end{vmatrix}$$

Expanding along  ${\sf R}_1$ 

$$= \frac{1}{2} \begin{bmatrix} -1 \begin{vmatrix} -3 & 1 \\ 2 & 1 \end{vmatrix} - 8 \begin{vmatrix} -2 & 1 \\ 3 & 1 \end{vmatrix} + 1 \begin{vmatrix} -2 & -3 \\ 3 & 2 \end{vmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} -1(-5) - 8(-5) + 1(5) \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 5 - 40 + 5 \end{bmatrix}$$
$$= \frac{-30}{2} \text{ sq.units}$$

as area cannot be negative

Therefore, 15 sq.unit is the area

Thus area of triangle is 15 sq.units

#### **1 D. Question**

Find the area of the triangle with vertices at the points:

(0, 0) (6, 0) and (4, 3)

## Answer

Given: - Vertices of the triangle: (0, 0) (6, 0) and (4, 3)

We know that,

If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now, substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ 6 & 0 & 1 \\ 4 & 3 & 1 \end{vmatrix}$$

Expanding along  $R_1$ 

$$= \frac{1}{2} \begin{bmatrix} 0 \begin{vmatrix} 0 & 1 \\ 3 & 1 \end{vmatrix} - 0 \begin{vmatrix} 6 & 1 \\ 4 & 1 \end{vmatrix} + 1 \begin{vmatrix} 6 & 0 \\ 4 & 3 \end{vmatrix} \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 0 - 0 + 1(18) \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 18 \end{bmatrix}$$

= 9 sq.units

Thus area of triangle is 9 sq.units

## 2 A. Question

Using determinants show that the following points are collinear:

(5, 5), (- 5, 1) and (10, 7)

#### Answer

Given: - (5, 5), (- 5, 1) and (10, 7) are three points

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero

Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 5 & 5 & 1 \\ -5 & 1 & 1 \\ 10 & 7 & 1 \end{vmatrix} = 0$$

R.H.S

Expanding along  $R_1$ 

$$= \frac{1}{2} \begin{bmatrix} 5 \begin{vmatrix} 1 & 1 \\ 7 & 1 \end{vmatrix} - 5 \begin{vmatrix} -5 & 1 \\ 10 & 1 \end{vmatrix} + 1 \begin{vmatrix} -5 & 1 \\ 10 & 7 \end{vmatrix} \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 5(-6) - 5(-15) + 1(-45) \end{bmatrix}$$

$$= \frac{1}{2}[-35 + 75 - 45]$$
  
= 0

Since, Area of triangle is zero

Hence, points are collinear

## 2 B. Question

Using determinants show that the following points are collinear:

(1, -1), (2, 1) and (4, 5)

## Answer

Given: - (1, - 1), (2, 1) and (4, 5) are three points

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero

Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 1 & -1 & 1 \\ 2 & 1 & 1 \\ 4 & 5 & 1 \end{vmatrix} = 0$$

R.H.S

Expanding along  $R_1$ 

$$= \frac{1}{2} \begin{bmatrix} 1 \begin{vmatrix} 1 & 1 \\ 5 & 1 \end{vmatrix} + 1 \begin{vmatrix} 2 & 1 \\ 4 & 1 \end{vmatrix} + 1 \begin{vmatrix} 2 & 1 \\ 4 & 5 \end{vmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 1 - 5 + 2 - 4 + 10 - 4 \end{bmatrix}$$
$$= \frac{1}{2} \begin{bmatrix} 0 \end{bmatrix}$$
$$= 0$$

= LHS

Since, Area of triangle is zero.

Hence, points are collinear.

## 2 C. Question

Using determinants show that the following points are collinear:

CLICK HERE

>>>

R www.studentbro.in

(3, - 2), (8, 8) and (5, 2)

Answer

Given: - (3, - 2), (8, 8) and (5, 2) are three points

Tip: - For Three points to be collinear, the area of triangle formed by these points will be zero Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 3 & -2 & 1 \\ 8 & 8 & 1 \\ 5 & 2 & 1 \end{vmatrix} = 0$$

R.H.S

Expanding along R<sub>1</sub>

$$= \frac{1}{2} \begin{bmatrix} 3 \begin{vmatrix} 8 & 1 \\ 2 & 1 \end{vmatrix} - 2 \begin{vmatrix} 8 & 1 \\ 5 & 1 \end{vmatrix} + 1 \begin{vmatrix} 8 & 8 \\ 5 & 2 \end{vmatrix} \\\\= \frac{1}{2} \begin{bmatrix} 3(6) - 2(3) + 1(-24) \end{bmatrix} \\\\= \frac{1}{2} \begin{bmatrix} 0 \end{bmatrix} \\\\= 0 \\\\= LHS$$

Since, Area of triangle is zero

Hence, points are collinear.

## 2 D. Question

Using determinants show that the following points are collinear:

(2, 3), (- 1, - 2) and (5, 8)

#### Answer

Given: - (2, 3), (-1, -2) and (5, 8) are three points

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero

Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 2 & 3 & 1 \\ -1 & -2 & 1 \\ 5 & 8 & 1 \end{vmatrix} = 0$$

R.H.S

$$\begin{array}{c|ccccc} 1 & 2 & 3 & 1 \\ \hline 1 & -1 & -2 & 1 \\ 5 & 8 & 1 \end{array}$$

Expanding along  $R_1$ 

$$= \frac{1}{2} \begin{bmatrix} 2 \begin{vmatrix} -2 & 1 \\ 8 & 1 \end{vmatrix} - 3 \begin{vmatrix} -1 & 1 \\ 5 & 1 \end{vmatrix} + 1 \begin{vmatrix} -1 & -2 \\ 5 & 8 \end{vmatrix} \\$$
$$= \frac{1}{2} \begin{bmatrix} 2(-10) - 3(-1 - 5) + 1(-8 + 10) \end{bmatrix} \\$$
$$= \frac{1}{2} \begin{bmatrix} -20 + 18 + 2 \end{bmatrix} \\$$
$$= 0$$

= LHS

Since, Area of triangle is zero

Hence, points are collinear.

## 3. Question

If the points (a, 0), (o, b) and (1, 1) are collinear, prove that a + b = ab.

## Answer

Given: - (a, 0), (o, b) and (1, 1) are collinear points

To Prove: -a + b = ab

Proof: -

Tip: – If Three points to be collinear, then the area of the triangle formed by these points will be zero Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Thus

$$\frac{1}{2} \begin{vmatrix} a & 0 & 1 \\ 0 & b & 1 \\ 1 & 1 & 1 \end{vmatrix} = 0$$

Expanding along  $\mathsf{R}_1$ 

$$\Rightarrow 0 = \frac{1}{2} \begin{bmatrix} a \begin{vmatrix} b & 1 \\ 1 & 1 \end{vmatrix} - 0 \begin{vmatrix} 0 & 1 \\ 1 & 1 \end{vmatrix} + 1 \begin{vmatrix} 0 & b \\ 1 & 1 \end{vmatrix}$$
$$\Rightarrow \frac{1}{2} \begin{bmatrix} a(b-1) - 0(-1) + 1(-b) \end{bmatrix} = 0$$
$$\Rightarrow \frac{1}{2} \begin{bmatrix} ab - a - b \end{bmatrix} = 0$$
$$\Rightarrow a + b = ab$$
Hence Proved

#### 4. Question

Using determinants prove that the points (a, b) (a', b') and (a - a', b - b') are collinear if ab' = a'b.

#### Answer

Given: -(a, b)(a', b') and (a - a', b - b') are points and ab' = a'b

To Prove: - (a, b) (a', b') and (a - a', b - b') are collinear points

Proof: -

Tip: - If three points to be collinear, then the area of the triangle formed by these points will be zero.

Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Thus

$$\frac{1}{2} \begin{vmatrix} a & b & 1 \\ a' & b' & 1 \\ a - a' & b - b' & 1 \end{vmatrix} = 0$$

Expanding along  $R_1$ 

$$\Rightarrow 0 = \frac{1}{2} \left[ a \Big|_{b-b'}^{b'} \frac{1}{1} \Big| - b \Big|_{a-a'}^{a'} \frac{1}{1} \Big| + 1 \Big|_{a-a'}^{a'} \frac{b'}{b-b'} \Big| \right]$$

$$\Rightarrow \frac{1}{2} \left[ a(b'-b+b') - b(a'-a+a') + 1(a'b-a'b'-ab'+a'b') \right] = 0$$

$$\Rightarrow \frac{1}{2} \left[ a'b-ab+ab'-a'b+ab+a'b+a'b-a'b'-ab'+a'b' \right] = 0$$

$$\Rightarrow ab'-a'b = 0$$

$$\Rightarrow ab'-a'b = 0$$
Hence, Proved.

#### 5. Question

Find the value of  $\lambda$  so that the points (1, – 5), (– 4, 5) and ( $\lambda$ , 7) are collinear.

#### Answer

Given: – (1, – 5), (– 4, 5) and  $(\lambda, 7)$  are collinear

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero Now, we know that,

vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 1 & -5 & 1 \\ -4 & 5 & 1 \\ \lambda & 7 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \frac{1}{2} \begin{bmatrix} 1 \begin{vmatrix} 5 & 1 \\ 7 & 1 \end{vmatrix} + 5 \begin{vmatrix} -4 & 1 \\ \lambda & 1 \end{vmatrix} + 1 \begin{vmatrix} -4 & 5 \\ \lambda & 7 \end{vmatrix} = 0 \Rightarrow \frac{1}{2} \begin{bmatrix} 1(-2) + 5(-4 - \lambda) + 1(-28 - 5\lambda) \end{bmatrix} = 0 \Rightarrow \frac{1}{2} \begin{bmatrix} -2 - 20 - 5\lambda - 28 - 5\lambda \end{bmatrix} = 0 \Rightarrow -50 - 10\lambda = 0 \Rightarrow \lambda = -5 \Rightarrow$$

## 6. Question

Find the value of x if the area of a triangle is 35 square cms with vertices (x, 4), (2, -6) and (5, 4).

#### Answer

Given: - Vertices of triangle are (x, 4), (2, - 6) and (5, 4) and area of triangle is 35 sq.cms

Tip: – If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now,

Substituting given value in above formula

$$\Rightarrow 35 = \begin{vmatrix} 1 \\ 2 \end{vmatrix} \begin{vmatrix} x & 4 & 1 \\ 2 & -6 & 1 \\ 5 & 4 & 1 \end{vmatrix}$$

Removing modulus

$$\Rightarrow \pm 2 \times 35 = \begin{vmatrix} x & 4 & 1 \\ 2 & -6 & 1 \\ 5 & 4 & 1 \end{vmatrix}$$

Expanding along  $\mathsf{R}_1$ 

$$\Rightarrow \begin{bmatrix} x \\ 4 \\ 1 \end{bmatrix} - 4 \begin{bmatrix} 2 \\ 5 \\ 1 \end{bmatrix} + 1 \begin{bmatrix} 2 \\ 5 \\ 4 \end{bmatrix} = \pm 70$$
  

$$\Rightarrow [x(-10) - 4(-3) + 1(8 - 30)] = \pm 70$$
  

$$\Rightarrow [-10x + 12 + 38] = \pm 70$$
  

$$\Rightarrow \pm 70 = -10x + 50$$
  
Taking + ve sign, we get  

$$\Rightarrow + 70 = -10x + 50$$
  

$$\Rightarrow 10x = -20$$
  

$$\Rightarrow x = -2$$
  
Taking - ve sign, we get  

$$\Rightarrow -70 = -10x + 50$$
  

$$\Rightarrow 10x = 120$$
  

$$\Rightarrow x = 12$$

Thus x = -2, 12

#### 7. Question

Using determinants, find the area of a triangle whose vertices are (1, 4), (2, 3) and (-5, -3). Are the given points collinear?

#### Answer

Given: - Vertices are (1, 4), (2, 3) and (- 5, - 3)

Tip: – If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 1 & 4 & 1 \\ 2 & 3 & 1 \\ -5 & -3 & 1 \end{vmatrix} = 0$$

Expanding along  $R_1$ 

$$\Rightarrow \Delta = \frac{1}{2} \begin{bmatrix} 1 \begin{vmatrix} 3 & 1 \\ -3 & 1 \end{vmatrix} - 4 \begin{vmatrix} 3 & 1 \\ -3 & 1 \end{vmatrix} + 1 \begin{vmatrix} 2 & 3 \\ -5 & -3 \end{vmatrix}$$
$$\Rightarrow \frac{1}{2} \begin{bmatrix} 1(6) - 4(7) + 1(9) \end{bmatrix} = \Delta$$
$$\Rightarrow \frac{1}{2} \begin{bmatrix} -13 \end{bmatrix} = \Delta$$

Since area can't be negative

$$\Rightarrow \Delta = \frac{13}{2}$$

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero

Now, as the area is not zero

Therefore, Points (1, 4), (2, 3) and (- 5, - 3) are not collinear.

#### 8. Question

Using determinants, find the area of the triangle with vertices (- 3, 5), (3, - 6) and (7, 2).

#### Answer

Given: - Vertices are (- 3, 5), (3, - 6) and (7, 2)

Tip: – If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} -3 & 5 & 1 \\ 3 & -6 & 1 \\ 7 & 2 & 1 \end{vmatrix}$$

Expanding along  $R_1$ 

$$\Rightarrow \Delta = \frac{1}{2} \begin{bmatrix} -3 \begin{vmatrix} -6 & 1 \\ 2 & 1 \end{vmatrix} - 5 \begin{vmatrix} 3 & 1 \\ 7 & 1 \end{vmatrix} + 1 \begin{vmatrix} 3 & -6 \\ 7 & 2 \end{vmatrix} \\\Rightarrow \frac{1}{2} \begin{bmatrix} -3(-8) - 5(-4) + 1(48) \end{bmatrix} = \Delta \\\Rightarrow \frac{1}{2} \begin{bmatrix} 24 + 20 + 48 \end{bmatrix} = \Delta \\\Rightarrow \Delta = \frac{92}{2}$$

 $\Rightarrow \Delta = 46$  sq. units

#### 9. Question

Using determinants, find the value of k so that the points (k, 2 – 2 k), (– k + 1, 2k) and (– 4 – k, 6 – 2k) may be collinear.

#### Answer

Given: – Points are (k, 2 - 2 k), (-k + 1, 2k) and (-4 - k, 6 - 2k) which are collinear

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero.

If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} k & 2-2k & 1 \\ -k+1 & 2k & 1 \\ -4-k & 6-2k & 1 \end{vmatrix} = 0$$

Expanding along R<sub>1</sub>

$$\Rightarrow \frac{1}{2} \begin{bmatrix} k \Big|_{6} \frac{2k}{-2k} & 1 \Big|_{-} (2-2k) \Big|_{-4-k}^{-k} & 1 \Big|_{-4-k}^{-k} + 1 & \frac{2k}{6-2k} \Big|_{-4-k}^{-k} & \frac{2k}{6-2k} \Big|_{-4-k}^{-k} = 0 \\ \Rightarrow k(2k-6+2k) - (2-2k)(-k+1+4+k) + 1(6-2k-6k+2k^2+8k+2k^2) = 0 \\ \Rightarrow 4k^2 - 6k - 10 + 10k + 6 + 4k^2 = 0 \\ \Rightarrow 8k^2 + 4k - 4 = 0 \\ \Rightarrow 8k^2 + 4k - 4 = 0 \\ \Rightarrow 8k^2 + 8k - 4k - 4 = 0 \\ \Rightarrow 8k(k+1) - 4(k+1) = 0 \\ \Rightarrow (8k-4)(k+1) = 0 \\ \text{If } 8k - 4 = 0 \\ \Rightarrow k = \frac{1}{2} \\ \text{And, If } k + 1 = 0 \\ \Rightarrow K = -1 \\ \text{Hence, } k = -1, 0.5 \\ \text{10. Question} \\ \text{If the points } (x, 2), (5, -2) \text{ and } (8, 8) \text{ are collinear, find x using determinants.}$$

Answer

Given: -(x, 2), (5, -2) and (8, 8) are collinear points

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero.

Now, we know that,

Vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

 $\Delta = \frac{1}{2} \begin{vmatrix} x & -2 & 1 \\ 5 & 2 & 1 \\ 8 & 8 & 1 \end{vmatrix} = 0$  $\Rightarrow \begin{vmatrix} x & -2 & 1 \\ 5 & 2 & 1 \\ 8 & 8 & 1 \end{vmatrix} = 0$ 

Expanding along  $R_1$ 

$$\Rightarrow \begin{bmatrix} x \begin{vmatrix} 2 & 1 \\ 8 & 1 \end{vmatrix} + 2 \begin{vmatrix} 5 & 1 \\ 8 & 1 \end{vmatrix} + 1 \begin{vmatrix} 5 & 2 \\ 8 & 8 \end{vmatrix} = 0$$
  
$$\Rightarrow \begin{bmatrix} x(-6) + 2(-3) + 1(24) \end{bmatrix} = 0$$
  
$$\Rightarrow -6x - 6 + 24 = 0$$
  
$$\Rightarrow x = 3$$

## 11. Question

If the points (3, -2), (x,2) and (8,8) are collinear, find x using determinant.

#### Answer

Given: - (3, - 2), (x,2) and (8,8) are collinear points

Tip: – For Three points to be collinear, the area of the triangle formed by these points will be zero Now, we know that,

Vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} 3 & -2 & 1 \\ x & 2 & 1 \\ 8 & 8 & 1 \end{vmatrix} = 0$$
$$\Rightarrow \begin{vmatrix} 3 & -2 & 1 \\ x & 2 & 1 \\ 8 & 8 & 1 \end{vmatrix} = 0$$

Expanding along R<sub>1</sub>

$$\Rightarrow \begin{bmatrix} x \begin{vmatrix} 2 & 1 \\ 8 & 1 \end{vmatrix} + 2 \begin{vmatrix} x & 1 \\ 8 & 1 \end{vmatrix} + 1 \begin{vmatrix} x & 2 \\ 8 & 8 \end{vmatrix} = 0$$
$$\Rightarrow [x(-6) + 2(x-8) + 1(8x-16)] = 0$$

```
\Rightarrow -6x + 2x - 16 + 8x - 16 = 0
```

 $\Rightarrow 10x = 50$ 

⇒ x = 5

## 12 A. Question

Using determinants, find the equation of the line joining the points

(1, 2) and (3, 6)

## Answer

Given: - (1, 2) and (3, 6) are collinear points

Tip: - For Three points to be collinear, the area of the triangle formed by these points will be zero Now, we know that,

Vertices of a triangle are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Let, 3<sup>rd</sup> point be (x,y)

Substituting given value in above formula

 $\Delta = \frac{1}{2} \begin{vmatrix} x & y & 1 \\ 1 & 2 & 1 \\ 3 & 6 & 1 \end{vmatrix} = 0$  $\Rightarrow \begin{vmatrix} x & y & 1 \\ 1 & 2 & 1 \\ 3 & 6 & 1 \end{vmatrix} = 0$ 

Expanding along R<sub>1</sub>

```
\Rightarrow \begin{bmatrix} x \begin{vmatrix} 2 & 1 \\ 6 & 1 \end{vmatrix} - y \begin{vmatrix} 1 & 1 \\ 3 & 1 \end{vmatrix} + 1 \begin{vmatrix} 1 & 2 \\ 3 & 6 \end{vmatrix} = 0
\Rightarrow \begin{bmatrix} x(-4) - y(-2) + 1(0) \end{bmatrix} = 0
\Rightarrow -4x + 2y = 0
\Rightarrow y = 2x
```

It's the equation of line

## 12 B. Question

Using determinants, find the equation of the line joining the points

(3, 1) and (9, 3)

## Answer

Given: - (3, 1) and (9, 3) are collinear points

Tip: - For Three points to be collinear, the area of triangle formed by these points will be zero

Now, we know that,

Vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Now,

Let, 3<sup>rd</sup> point be (x,y)

Substituting given value in above formula

$$\Delta = \frac{1}{2} \begin{vmatrix} x & y & 1 \\ 3 & 1 & 1 \\ 9 & 3 & 1 \end{vmatrix} = 0$$
$$\Rightarrow \begin{vmatrix} x & y & 1 \\ 3 & 1 & 1 \\ 9 & 3 & 1 \end{vmatrix} = 0$$

Expanding along  $\rm R_1$ 

$$\Rightarrow \begin{bmatrix} x \begin{vmatrix} 1 & 1 \\ 3 & 1 \end{vmatrix} - y \begin{vmatrix} 3 & 1 \\ 9 & 1 \end{vmatrix} + 1 \begin{vmatrix} 1 & 3 \\ 3 & 9 \end{vmatrix} = 0$$
  
$$\Rightarrow \begin{bmatrix} x(-2) - y(-6) + 1(0) \end{bmatrix} = 0$$
  
$$\Rightarrow -2x + 6y = 0$$
  
$$\Rightarrow x - 3y = 0$$
  
It's the equation of line

## 13 A. Question

Find values of K, if the area of a triangle is 4 square units whose vertices are

(k,0), (4,0) and (0,2)

#### Answer

Given: - Vertices of triangle are (k, 0), (4, 0) and (0, 2) and area of triangle is 4 sq. units

Tip: – If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now,

Substituting given value in above formula

$$\Rightarrow 4 = \begin{vmatrix} 1 \\ \frac{1}{2} \begin{vmatrix} k & 0 & 1 \\ 4 & 0 & 1 \\ 0 & 2 & 1 \end{vmatrix}$$

Removing modulus

$$\Rightarrow \pm 2 \times 4 = \begin{vmatrix} k & 0 & 1 \\ 4 & 0 & 1 \\ 0 & 2 & 1 \end{vmatrix}$$

Expanding along  $R_1$ 

$$\Rightarrow \begin{bmatrix} k \begin{vmatrix} 0 & 1 \\ 2 & 1 \end{vmatrix} - 0 \begin{vmatrix} 4 & 1 \\ 0 & 1 \end{vmatrix} + 1 \begin{vmatrix} 4 & 0 \\ 0 & 2 \end{vmatrix} = \pm 8$$
$$\Rightarrow \begin{bmatrix} k(-2) - 0(4) + 1(8 - 0) \end{bmatrix} = \pm 8$$
$$\Rightarrow \begin{bmatrix} -2k + 8 \end{bmatrix} = \pm 8$$

Taking + ve sign, we get  $\Rightarrow + 8 = -2x + 8$   $\Rightarrow -2k = 0$   $\Rightarrow k = 0$ Taking - ve sign, we get  $\Rightarrow -8 = -2x + 8$   $\Rightarrow -2x = -16$   $\Rightarrow x = 8$ Thus x = 0, 8

## 13 B. Question

Find values of K, if the area of a triangle is 4 square units whose vertices are

(- 2,0), (0, 4) and (0, k)

#### Answer

Given: - Vertices of triangle are (- 2,0), (0, 4) and (0, k) and the area of the triangle is 4 sq. units.

Tip: – If vertices of a triangle are  $(x_1,y_1)$ ,  $(x_2,y_2)$  and  $(x_3,y_3)$ , then the area of the triangle is given by:

**CLICK HERE** 

 $\gg$ 

R www.studentbro.in

$$\Delta = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Now,

Substituting given value in above formula

$$\Rightarrow 4 = \begin{vmatrix} -2 & 0 & 1 \\ 0 & 4 & 1 \\ 0 & k & 1 \end{vmatrix}$$

Removing modulus

$$\Rightarrow \pm 2 \times 4 = \begin{vmatrix} -2 & 0 & 1 \\ 0 & 4 & 1 \\ 0 & k & 1 \end{vmatrix}$$

Expanding along R<sub>1</sub>

$$\Rightarrow \begin{bmatrix} -2 \\ k \\ 1 \end{bmatrix} - 0 \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} + 1 \begin{bmatrix} 0 \\ 0 \\ k \end{bmatrix} = \pm 8$$
  

$$\Rightarrow \begin{bmatrix} -2(4 - k) - 0(0) + 1(0 - 0) \end{bmatrix} = \pm 8$$
  

$$\Rightarrow -8 + 2k = \pm 8$$
  
Taking + ve sign, we get  

$$\Rightarrow 8 = -8 + 2k$$
  

$$\Rightarrow 2k = 16$$
  

$$\Rightarrow k = 8$$
  
Taking - ve sign, we get  

$$\Rightarrow -8 = 2x - 8$$
  

$$\Rightarrow 2k = 0$$
  

$$\Rightarrow k = 0$$

Thus k = 0, 8

## Exercise 6.4

## 1. Question

Solve the following systems of linear equations by Cramer's rule:

x - 2y = 4

-3x + 5y = -7

#### Answer

Given: - Two equations x - 2y = 4 and - 3x + 5y = -7

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$\operatorname{Let} D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

x - 2y = 4

-3x + 5y = -7

So by comparing with the theorem, let's find D,  $D_1$  and  $D_2$ 

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 1 & -2 \\ -3 & 5 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D_1 = \begin{vmatrix} 4 & -2 \\ -7 & 5 \end{vmatrix}$$

Solving determinant, expanding along  $\mathbf{1}^{\text{st}}$  row

⇒ 
$$D_1 = 5(4) - (-7)(-2)$$
  
⇒  $D_1 = 20 - 14$   
⇒  $D_1 = 6$   
and

 $\Rightarrow D_2 = \begin{vmatrix} 1 & 4 \\ -3 & -7 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

⇒  $D_2 = 1(-7) - (-3)(4)$ ⇒  $D_2 = -7 + 12$ ⇒  $D_2 = 5$ 

Thus by Cramer's Rule, we have

 $\Rightarrow X = \frac{D_1}{D}$  $\Rightarrow X = \frac{6}{-1}$  $\Rightarrow x = -6$ and

$$\Rightarrow y = \frac{D_2}{D}$$
$$\Rightarrow y = \frac{5}{-1}$$
$$\Rightarrow y = -5$$

#### 2. Question

Solve the following systems of linear equations by Cramer's rule:

2x - y = 17x - 2y = -7

# Answer

Given: - Two equations 2x - y = 1 and 7x - 2y = -7

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

```
\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots \vdots &\\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \\ \\ Let D &= \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}
```

and let  $D_i$  be the determinant obtained from D after replacing the  $j^{th}$  column by

CLICK HERE

>>>

🕀 www.studentbro.in

## Then,

$$x_1 \,=\, \frac{D_1}{D}$$
 ,  $x_2 \,=\, \frac{D_2}{D}$  , ... ,  $x_n \,=\, \frac{D_n}{D}$  provided that D  $\neq 0$ 

Now, here we have

$$2x - y = 1$$

$$7x - 2y = -7$$

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 2 & -1 \\ 7 & -2 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

Again,

$$\Rightarrow D_1 = \begin{vmatrix} 1 & -1 \\ -7 & -2 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

⇒ 
$$D_1 = 1(-2) - (-7)(-1)$$
  
⇒  $D_1 = -2 - 7$   
⇒  $D_1 = -9$   
and

$$\Rightarrow D_2 = \begin{vmatrix} 2 & 1 \\ 7 & -7 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D_2 = 2(-7) - (7)(1)$$
  
$$\Rightarrow D_2 = -14 - 7$$
  
$$\Rightarrow D_2 = -21$$
  
Thus by Cramer's Rule, we have

$$\Rightarrow x = \frac{D_1}{D}$$

$$\Rightarrow x = \frac{-9}{3}$$

$$\Rightarrow x = -3$$
and
$$\Rightarrow y = \frac{D_2}{D}$$

$$\Rightarrow y = \frac{-21}{3}$$

⇒ y = - 7

#### 3. Question

Solve the following systems of linear equations by Cramer's rule:

2x - y = 17

3x + 5y = 6

#### Answer

Given: - Two equations 2x - y = 17 and 3x + 5y = 6

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $D_i$  be the determinant obtained from D after replacing the  $j^{th}$  column by

Then,

$$x_1 \ = \ \frac{D_1}{D}$$
 ,  $x_2 \ = \ \frac{D_2}{D}$  , ... ,  $x_n \ = \ \frac{D_n}{D}$  provided that D  $\neq 0$ 

Now, here we have

2x - y = 17

3x + 5y = 6

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

 $\Rightarrow D = \begin{vmatrix} 2 & -1 \\ 3 & 5 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

⇒ D = 2(5) - (3)( - 1) ⇒ D = 10 + 3

⇒ D = 13

Again,

$$\Rightarrow D_1 = \begin{vmatrix} 17 & -1 \\ 6 & 5 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D}_1 = 17(5) - (6)(-1)$ 

$$\Rightarrow D_1 = 85 + 6$$
$$\Rightarrow D_1 = 91$$
and

$$\Rightarrow D_2 = \begin{vmatrix} 2 & 17 \\ 3 & 6 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

⇒  $D_2 = 2(6) - (17)(3)$ ⇒  $D_2 = 12 - 51$ ⇒  $D_2 = -39$ 

Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$   $\Rightarrow x = \frac{91}{13}$   $\Rightarrow x = 7$ and  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = \frac{-39}{13}$ 

⇒ y = - 3

## 4. Question

Solve the following systems of linear equations by Cramer's rule:

3x + y = 19

3x - y = 23

#### Answer

Given: - Two equations 3x + y = 19 and 3x - y = 23

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots \vdots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \\ \\ Let D &= \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix} \end{aligned}$$

and let  $\mathsf{D}_{j}$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

## Then,

$$x_1 = \frac{D_1}{D}$$
 ,  $x_2 = \frac{D_2}{D}$  , ... ,  $x_n = \frac{D_n}{D}$  provided that D  $\neq$  0

Now, here we have

$$3x + y = 19$$

$$3x - y = 23$$

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 3 & 1 \\ 3 & -1 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D_1 = \begin{vmatrix} 19 & 1 \\ 23 & -1 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

⇒ 
$$D_1 = 19(-1) - (23)(1)$$
  
⇒  $D_1 = -19 - 23$   
⇒  $D_1 = -42$   
and

$$\Rightarrow D_2 = \begin{vmatrix} 3 & 19 \\ 3 & 23 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

we have

⇒ 
$$D_2 = 3(23) - (19)(3)$$
  
⇒  $D_2 = 69 - 57$   
⇒  $D_2 = 12$   
Thus by Cramer's Rule,

$$\Rightarrow x = \frac{D_1}{D}$$

$$\Rightarrow x = \frac{-42}{-6}$$

$$\Rightarrow x = 7$$
and
$$\Rightarrow y = \frac{D_2}{D}$$

$$\Rightarrow y = \frac{12}{-6}$$

⇒ y = - 2

#### 5. Question

Solve the following systems of linear equations by Cramer's rule:

2x - y = -2

3x + 4y = 3

## Answer

Given : - Two equations 2x - y = -2 and 3x + 4y = 3

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

2x - y = -2

3x + 4y = 3

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

 $\Rightarrow D = \begin{vmatrix} 2 & -1 \\ 3 & 4 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

⇒ D = 2(4) - (3)( - 1) ⇒ D = 8 + 3

⇒ D = 11

Again,

$$\Rightarrow D_1 = \begin{vmatrix} -2 & -1 \\ 3 & 4 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D_1 = -2(4) - (3)(-1)$ 

$$\Rightarrow D_1 = -8 + 3$$
$$\Rightarrow D_1 = -5$$
and

$$\Rightarrow D_2 = \begin{vmatrix} 2 & -2 \\ 3 & 3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

⇒  $D_2 = 3(2) - (-2)(3)$ ⇒  $D_2 = 6 + 6$ ⇒  $D_2 = 12$ 

Thus by Cramer's Rule, we have

$$\Rightarrow X = \frac{D_1}{D}$$
$$\Rightarrow X = \frac{-5}{11}$$

and

$$\Rightarrow y = \frac{D_2}{D}$$
$$\Rightarrow y = \frac{12}{11}$$

## 6. Question

Solve the following systems of linear equations by Cramer's rule:

3x + ay = 4

 $2x + ay = 2, a \neq 0$ 

#### Answer

Given: - Two equations 3x + ay = 4 and 2x + ay = 2,  $a \neq 0$ 

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$
  
 $a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$ 

:::

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_{j}$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

b<sub>1</sub> b<sub>2</sub> : b<sub>n</sub>

Then,

$$x_1 = \frac{D_1}{D}$$
 ,  $x_2 = \frac{D_2}{D}$  , ... ,  $x_n = \frac{D_n}{D}$  provided that  $\mathsf{D} \neq \mathsf{0}$ 

Now, here we have

3x + ay = 4

 $2x + ay = 2, a \neq 0$ 

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

 $\Rightarrow D = \begin{vmatrix} 3 & a \\ 2 & a \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D} = \mathsf{3}(\mathsf{a}) - (\mathsf{2})(\mathsf{a})$ 

⇒ D = 3a - 2a

⇒ D = a

Again,

$$\Rightarrow D_1 = \begin{vmatrix} 4 & a \\ 2 & a \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D_1 = 4(a) - (2)(a)$  $\Rightarrow D = 4a - 2a$  $\Rightarrow D = 2a$ 

and

 $\Rightarrow D_2 = \begin{vmatrix} 3 & 4 \\ 2 & 2 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D_2 = 3(2) - (2)(4)$  $\Rightarrow D = 6 - 8$  $\Rightarrow D = - 2$ Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$  $\Rightarrow x = \frac{2a}{a}$  $\Rightarrow x = 2$ and $\Rightarrow y = \frac{D_2}{D}$  $\Rightarrow y = \frac{-2}{a}$ 

## 7. Question

Solve the following systems of linear equations by Cramer's rule:

2x + 3y = 10

x + 6y = 4

#### Answer

Given: - Two equations 2x - 3y = 10 and x + 6y = 4

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots \vdots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \\ \\ Let D &= \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix} \end{aligned}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

2x + 3y = 10

x + 6y = 4

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

 $\Rightarrow D = \begin{vmatrix} 2 & 3 \\ 1 & 6 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D = 2(6) - (3)(1)$  $\Rightarrow D = 12 - 3$  $\Rightarrow D = 9$ Again,

 $\Rightarrow D_1 = \begin{vmatrix} 10 & 3 \\ 4 & 6 \end{vmatrix}$ 

Solving determinant, expanding along  $\mathbf{1}^{\text{st}}$  row

 $\Rightarrow D_1 = 10(6) - (3)(4)$   $\Rightarrow D = 60 - 12$   $\Rightarrow D = 48$ and  $\Rightarrow D_2 = \begin{vmatrix} 2 & 10 \\ 1 & 4 \end{vmatrix}$ 

Solving determinant, expanding along  $1^{st}$  row

⇒  $D_2 = 2(4) - (10)(1)$ ⇒  $D_2 = 8 - 10$ ⇒  $D_2 = -2$ 

Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$   $\Rightarrow x = \frac{48}{9}$   $\Rightarrow x = \frac{16}{3}$ and  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = \frac{-2}{9}$   $\Rightarrow y = \frac{-2}{9}$ 

## 8. Question

Solve the following systems of linear equations by Cramer's rule:

5x + 7y = -2

4x + 6y = -3

#### Answer

Given: - Two equations 5x + 7y = -2 and 4x + 6y = -3

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

b<sub>1</sub> b<sub>2</sub> : b<sub>2</sub>

Then,

$$x_1 \ = \ \frac{D_1}{D}$$
 ,  $x_2 \ = \ \frac{D_2}{D}$  , ... ,  $x_n \ = \ \frac{D_n}{D}$  provided that D  $\neq 0$ 

Now, here we have

5x + 7y = -2

4x + 6y = -3

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 5 & 7 \\ 4 & 6 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D} = \mathsf{5}(6) - (7)(4)$ 

⇒ D = 30 - 28

Again,

 $\Rightarrow D_1 = \begin{vmatrix} -2 & 7 \\ -3 & 6 \end{vmatrix}$ 

Solving determinant, expanding along  $1^{st}$  row

⇒ 
$$D_1 = -2(6) - (7)(-3)$$
  
⇒  $D_1 = -12 + 21$   
⇒  $D_1 = 9$ 

and

$$\Rightarrow D_2 = \begin{vmatrix} 5 & -2 \\ 4 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

⇒ 
$$D_2 = -3(5) - (-2)(4)$$
  
⇒  $D_2 = -15 + 8$   
⇒  $D_2 = -7$ 

Thus by Cramer's Rule, we have

$$\Rightarrow x = \frac{D_1}{D}$$

$$\Rightarrow x = \frac{9}{2}$$

$$\Rightarrow x = \frac{9}{2}$$
and
$$\Rightarrow y = \frac{D_2}{D}$$

$$\Rightarrow y = \frac{-7}{2}$$

$$\Rightarrow y = \frac{-7}{2}$$
9. Question

Solve the following systems of linear equations by Cramer's rule:

9x + 5y = 10

3y - 2x = 8

#### Answer

Given: - Two equations 9x + 5y = 10 and 3y - 2x = 8

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

```
a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2
```

:::

 $a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n = b_n$ 

 $Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$ 

and let  $D_i$  be the determinant obtained from D after replacing the  $j^{th}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
 ,  $x_2 = \frac{D_2}{D}$  , ... ,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

9x + 5y = 10

3y - 2x = 8

So by comparing with the theorem, let's find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 9 & 5 \\ -2 & 3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D = 3(9) - (5)(-2)$  $\Rightarrow D = 27 + 10$  $\Rightarrow D = 37$ Again,

 $\Rightarrow D_1 = \begin{vmatrix} 10 & 5 \\ 8 & 3 \end{vmatrix}$ 

Solving determinant, expanding along  $\mathbf{1}^{st}$  row

⇒ 
$$D_1 = 10(3) - (8)(5)$$
  
⇒  $D_1 = 30 - 40$   
⇒  $D_1 = -10$   
and

$$\Rightarrow D_2 = \begin{vmatrix} 9 & 10 \\ -2 & 8 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

⇒  $D_2 = 9(8) - (10)(-2)$ ⇒  $D_2 = 72 + 20$ 

Thus by Cramer's Rule, we have

 $\Rightarrow X = \frac{D_1}{D}$  $\Rightarrow X = \frac{-10}{37}$  $\Rightarrow X = \frac{-10}{37}$ and

 $\Rightarrow D_2 = 92$ 

$$\Rightarrow y = \frac{D_2}{D}$$
$$\Rightarrow y = \frac{92}{37}$$
$$\Rightarrow y = \frac{92}{37}$$

#### 10. Question

Solve the following systems of linear equations by Cramer's rule:

x + 2y = 1

3x + y = 4

#### Answer

Given: - Two equations x + 2y = 1 and 3x + y = 4

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$
$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$
$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

b<sub>1</sub> b<sub>2</sub> : b<sub>n</sub>

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

x + 2y = 1

3x + y = 4

So by comparing with theorem, lets find D,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

 $\Rightarrow D = \begin{vmatrix} 1 & 2 \\ 3 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D = 1(1) - (3)(2)$  $\Rightarrow D = 1 - 6$  $\Rightarrow D = -5$ 

Again,

$$\Rightarrow D_1 = \begin{vmatrix} 1 & 2 \\ 4 & 1 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D_1 = 1(1) - (2)(4)$  $\Rightarrow D_1 = 1 - 8$  $\Rightarrow D_1 = -7$ and

 $\Rightarrow D_2 = \begin{vmatrix} 1 & 1 \\ 3 & 4 \end{vmatrix}$ 

Solving determinant, expanding along  $1^{st}$  row

 $\Rightarrow D_2 = 1(4) - (1)(3)$  $\Rightarrow D_2 = 4 - 3$  $\Rightarrow D_2 = 1$ Thus by Cramor's Pul

Thus by Cramer's Rule, we have

$$\Rightarrow x = \frac{D_1}{D}$$

$$\Rightarrow x = \frac{-7}{-5}$$

$$\Rightarrow x = \frac{7}{5}$$
and
$$\Rightarrow y = \frac{D_2}{D}$$

$$\Rightarrow y = \frac{1}{-5}$$

$$\Rightarrow y = -\frac{1}{5}$$

## 11. Question

Solve the following system of the linear equations by Cramer's rule:

3x + y + z = 22x - 4y + 3z = -14x + y - 3z = -11

#### Answer

Given: - Equations are: -

3x + y + z = 22x - 4y + 3z = -14x + y - 3z = -11

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$
$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$
$$\vdots \vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

3x + y + z = 22x - 4y + 3z = -1

$$4x + y - 3z = -11$$

So by comparing with the theorem, let's find D,  $\mathsf{D}_1,\,\mathsf{D}_2$  and  $\mathsf{D}_3$ 

$$\Rightarrow D = \begin{vmatrix} 3 & 1 & 1 \\ 2 & -4 & 3 \\ 4 & 1 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D = 3[(-4)(-3) - (3)(1)] - 1[(2)(-3) - 12] + 1[2 - 4(-4)]$$
  
$$\Rightarrow D = 3[12 - 3] - [-6 - 12] + [2 + 16]$$
  
$$\Rightarrow D = 27 + 18 + 18$$
  
$$\Rightarrow D = 63$$
  
Again,

🕀 www.studentbro.in

$$\Rightarrow D_1 = \begin{vmatrix} 2 & 1 & 1 \\ -1 & -4 & 3 \\ -11 & 1 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D_{1} = 2[(-4)(-3) - (3)(1)] - 1[(-1)(-3) - (-11)(3)] + 1[(-1) - (-4)(-11)]$$
  

$$\Rightarrow D_{1} = 2[12 - 3] - 1[3 + 33] + 1[-1 - 44]$$
  

$$\Rightarrow D_{1} = 2[9] - 36 - 45$$
  

$$\Rightarrow D_{1} = 18 - 36 - 45$$
  

$$\Rightarrow D_{1} = -63$$

Again

$$\Rightarrow D_2 = \begin{vmatrix} 3 & 2 & 1 \\ 2 & -1 & 3 \\ 4 & -11 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D_2 = 3[3 + 33] - 2[-6 - 12] + 1[-22 + 4]$$
$$\Rightarrow D_2 = 3[36] - 2(-18) - 18$$

$$\Rightarrow D_2 = 126$$

And,

$$\Rightarrow D_3 = \begin{vmatrix} 3 & 1 & 2 \\ 2 & -4 & -1 \\ 4 & 1 & -11 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> row

$$\Rightarrow D_3 = 3[44 + 1] - 1[-22 + 4] + 2[2 + 16]$$
  
$$\Rightarrow D_3 = 3[45] - 1(-18) + 2(18)$$
  
$$\Rightarrow D_3 = 135 + 18 + 36$$
  
$$\Rightarrow D_3 = 189$$

Thus by Cramer's Rule, we have

$$\Rightarrow x = \frac{D_1}{D}$$

$$\Rightarrow x = \frac{-63}{63}$$

$$\Rightarrow x = -1$$
again,
$$\Rightarrow y = \frac{D_2}{D}$$

$$\Rightarrow y = \frac{126}{63}$$

$$\Rightarrow y = 2$$
and,
$$\Rightarrow z = \frac{D_2}{D}$$

 $\Rightarrow$  Z =  $\frac{189}{63}$ 

⇒ z = 3

## 12. Question

Solve the following system of the linear equations by Cramer's rule:

x - 4y - z = 112x - 5y + 2z = 39- 3x + 2y + z = 1

#### Answer

Given: - Equations are: -

x - 4y - z = 11

2x - 5y + 2z = 39

-3x + 2y + z = 1

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$|a_{11} + a_{12} + \dots + a_{nn}|$$

Let D =  $\begin{bmatrix} a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{bmatrix}$ 

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

x - 4y - z = 11

2x - 5y + 2z = 39

$$-3x + 2y + z = 1$$

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 1 & -4 & -1 \\ 2 & -5 & 2 \\ -3 & 2 & 1 \end{vmatrix}$$

Solving determinant, expanding along  $\mathbf{1}^{st}$  row

 $\Rightarrow \mathsf{D} = \mathbb{1}[(-5)(1) - (2)(2)] + \mathbb{4}[(2)(1) + 6] - \mathbb{1}[\mathbb{4} + 5(-3)]$ 

Get More Learning Materials Here : **\_** 

CLICK HERE

 $\Rightarrow D = 1[-5-4] + 4[8] - [-11]$  $\Rightarrow D = -9 + 32 + 11$  $\Rightarrow D = 34$ 

Again,

 $\Rightarrow D_1 = \begin{vmatrix} 11 & -4 & -1 \\ 39 & -5 & 2 \\ 1 & 2 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D_1 = 11[(-5)(1) - (2)(2)] + 4[(39)(1) - (2)(1)] - 1[2(39) - (-5)(1)]$   $\Rightarrow D_1 = 11[-5 - 4] + 4[39 - 2] - 1[78 + 5]$   $\Rightarrow D_1 = 11[-9] + 4(37) - 83$   $\Rightarrow D_1 = -99 - 148 - 45$   $\Rightarrow D_1 = -34$ Again

 $\Rightarrow D_2 = \begin{vmatrix} 1 & 11 & -1 \\ 2 & 39 & 2 \\ -3 & 1 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\Rightarrow D_2 = 1[39 - 2] - 11[2 + 6] - 1[2 + 117]$  $\Rightarrow D_2 = 1[37] - 11(8) - 119$  $\Rightarrow D_2 = -170$ 

And,

 $\Rightarrow D_3 = \begin{vmatrix} 1 & -4 & 11 \\ 2 & -5 & 39 \\ -3 & 2 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> row

 $\begin{array}{l} \Rightarrow \mathsf{D}_3 = 1[-5-(39)(2)] - (-4)[2-(39)(-3)] + 11[4-(-5)(-3)] \\ \Rightarrow \mathsf{D}_3 = 1[-5-78] + 4(2+117) + 11(4-15) \\ \Rightarrow \mathsf{D}_3 = -83 + 4(119) + 11(-11) \\ \Rightarrow \mathsf{D}_3 = 272 \end{array}$ 

Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$  $\Rightarrow x = \frac{-34}{34}$  $\Rightarrow x = -1$ again, $\Rightarrow y = \frac{D_2}{D}$  $\Rightarrow y = \frac{-170}{24}$ 

Get More Learning Materials Here : 📕

⇒ y = - 5

and,

$$\Rightarrow Z = \frac{D_3}{D}$$
$$\Rightarrow Z = \frac{272}{34}$$

⇒ z = 8

## 13. Question

Solve the following system of the linear equations by Cramer's rule:

6x + y - 3z = 5X + 3y - 2z = 5

2x + y + 4z = 8

#### Answer

Given: - Equations are: -

6x + y - 3z = 5

X + 3y - 2z = 5

$$2x + y + 4z = 8$$

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$
$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$
$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_{j}$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

 $x_1 = \frac{D_1}{D}$ ,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ Now, here we have

6x + y - 3z = 5

$$x + 3y - 2z = 5$$

$$2x + y + 4z = 8$$

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

Get More Learning Materials Here : 💶

$$\Rightarrow D = \begin{vmatrix} 6 & 1 & -3 \\ 1 & 3 & -2 \\ 2 & 1 & 4 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D = 6[(4)(3) - (1)(-2)] - 1[(4)(1) + 4] - 3[1 - 3(2)]$$
  
$$\Rightarrow D = 6[12 + 2] - [8] - 3[ - 5]$$
  
$$\Rightarrow D = 84 - 8 + 15$$
  
$$\Rightarrow D = 91$$

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 5 \\ 5 \\ 8 \end{vmatrix}$$

$$\Rightarrow D_1 = \begin{vmatrix} 5 & 3 & -2 \\ 8 & 1 & 4 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

-3

 $\Rightarrow D_1 = 5[(4)(3) - (-2)(1)] - 1[(5)(4) - (-2)(8)] - 3[(5) - (3)(8)]$   $\Rightarrow D_1 = 5[12 + 2] - 1[20 + 16] - 3[5 - 24]$   $\Rightarrow D_1 = 5[14] - 36 - 3(-19)$   $\Rightarrow D_1 = 70 - 36 + 57$  $\Rightarrow D_1 = 91$ 

Again, Solve  $D_2$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 5 \\ 5 \\ 8 \end{vmatrix}$$
  

$$\Rightarrow D_2 = \begin{vmatrix} 6 & 5 & -3 \\ 1 & 5 & -2 \\ 2 & 8 & 4 \end{vmatrix}$$

Solving determinant

$$\Rightarrow \mathsf{D}_2 = 6[20 + 16] - 5[4 - 2(-2)] + (-3)[8 - 10]$$

$$\Rightarrow \mathsf{D}_2 = 6[36] - 5(8) + (-3)(-2)$$

$$\Rightarrow D_2 = 182$$

And, Solve  $\mathsf{D}_3$  formed by replacing  $1^{st}$  column by B matrices

Here

 $B = \begin{vmatrix} 5 \\ 5 \\ 8 \end{vmatrix}$  $\Rightarrow D_3 = \begin{vmatrix} 6 & 1 & 5 \\ 1 & 3 & 5 \\ 2 & 1 & 8 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> Row

 $\Rightarrow D_3 = 6[24 - 5] - 1[8 - 10] + 5[1 - 6]$  $\Rightarrow D_3 = 6[19] - 1(-2) + 5(-5)$  $\Rightarrow D_3 = 114 + 2 - 25$  $\Rightarrow D_3 = 91$ 

Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$   $\Rightarrow x = \frac{91}{91}$   $\Rightarrow x = 1$ again,  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = \frac{182}{91}$   $\Rightarrow y = 2$ and,  $\Rightarrow z = \frac{D_3}{D}$   $\Rightarrow z = \frac{91}{91}$ 

#### ⇒ z = 1

## 14. Question

Solve the following system of the linear equations by Cramer's rule:

x + y = 5 y + z = 3 x + z = 4

#### Answer

Given: - Equations are: -

x + y = 5

y + z = 3

$$x + z = 4$$

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$\operatorname{Let} D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $D_i$  be the determinant obtained from D after replacing the  $j^{th}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

x + y = 5y + z = 3x + z = 4

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

 $\Rightarrow D = \begin{vmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> Row

 $\Rightarrow D = 1[1] - 1[ - 1] + 0[ - 1]$  $\Rightarrow D = 1 + 1 + 0$  $\Rightarrow D = 2$  $\Rightarrow D = 2$ 

Again, Solve  $\mathsf{D}_1$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 5 \\ 3 \\ 4 \end{vmatrix}$$
  

$$\Rightarrow D_1 = \begin{vmatrix} 5 & 1 & 0 \\ 3 & 1 & 1 \\ 4 & 0 & 1 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

 $\begin{array}{l} \Rightarrow D_{1} = 5[1] - 1[(3)(1) - (4)(1)] + 0[0 - (4)(1)] \\ \Rightarrow D_{1} = 5 - 1[3 - 4] + 0[-4] \\ \Rightarrow D_{1} = 5 - 1[-1] + 0 \\ \Rightarrow D_{1} = 5 + 1 + 0 \\ \Rightarrow D_{1} = 6 \end{array}$ Again, Solve D<sub>2</sub> formed by replacing 1<sup>st</sup> column by B matrices

Here

Get More Learning Materials Here :

**CLICK HERE** 

≫

Regional www.studentbro.in

$$B = \begin{vmatrix} 5 \\ 3 \\ 4 \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 1 & 5 & 0 \\ 0 & 3 & 1 \\ 1 & 4 & 1 \end{vmatrix}$$

Solving determinant

 $\Rightarrow D_2 = 1[3 - 4] - 5[ - 1] + 0[0 - 3]$  $\Rightarrow D_2 = 1[ - 1] + 5 + 0$  $\Rightarrow D_2 = 4$ 

And, Solve  $\mathsf{D}_3$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 5 \\ 3 \\ 4 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 1 & 1 & 5 \\ 0 & 1 & 3 \\ 1 & 0 & 4 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_3 = 1[4 - 0] - 1[0 - 3] + 5[0 - 1]$$
  
$$\Rightarrow D_3 = 1[4] - 1(-3) + 5(-1)$$
  
$$\Rightarrow D_3 = 4 + 3 - 5$$
  
$$\Rightarrow D_3 = 2$$

Thus by Cramer's Rule, we have

$$\Rightarrow \mathbf{x} = \frac{\mathbf{D}_1}{\mathbf{D}}$$

$$\Rightarrow \mathbf{x} = \frac{\mathbf{6}}{2}$$

$$\Rightarrow \mathbf{x} = 3$$
again,
$$\Rightarrow \mathbf{y} = \frac{\mathbf{D}_2}{\mathbf{D}}$$

$$\Rightarrow \mathbf{y} = \frac{\mathbf{4}}{2}$$

$$\Rightarrow \mathbf{y} = 2$$
and,
$$\Rightarrow \mathbf{z} = \frac{\mathbf{D}_3}{\mathbf{D}}$$

$$\Rightarrow \mathbf{z} = \frac{2}{2}$$

$$\Rightarrow \mathbf{z} = 1$$
**15. Question**

Solve the following system of the linear equations by Cramer's rule:

2y - 3z = 0X + 3y = - 4 3x + 4y = 3

#### Answer

Given: - Equations are: -

2y - 3z = 0X + 3y = - 4 3x + 4y = 3

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$
$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_{j}$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

2y - 3z = 0

x + 3y = -4

$$3x + 4y = 3$$

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 0 & 2 & -3 \\ 1 & 3 & 0 \\ 3 & 4 & 0 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D = 0[0] - 2[(0)(1) - 0] - 3[1(4) - 3(3)]$$
$$\Rightarrow D = 0 - 0 - 3[4 - 9]$$
$$\Rightarrow D = 0 - 0 + 15$$

$$\Rightarrow D = 15$$

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Get More Learning Materials Here : 📕

Here

$$B = \begin{vmatrix} 0 \\ -4 \\ 3 \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} 0 & 2 & -3 \\ -4 & 3 & 0 \\ 3 & 4 & 0 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_{1} = 0[0] - 2[(0)(-4) - 0] - 3[4(-4) - 3(3)]$$
  

$$\Rightarrow D_{1} = 0 - 0 - 3[-16 - 9]$$
  

$$\Rightarrow D_{1} = 0 - 0 - 3(-25)$$
  

$$\Rightarrow D_{1} = 0 - 0 + 75$$
  

$$\Rightarrow D_{1} = 75$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} 0 \\ -4 \\ 3 \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 0 & 0 & -3 \\ 1 & -4 & 0 \\ 3 & 3 & 0 \end{vmatrix}$$

Solving determinant

$$\Rightarrow D_2 = 0[0] - 0[(0)(1) - 0] - 3[1(3) - 3(-4)]$$
$$\Rightarrow D_2 = 0 - 0 + (-3)(3 + 12)$$
$$\Rightarrow D_2 = -45$$

And, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

Here

$$B = \begin{vmatrix} 0 \\ -4 \\ 3 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 0 & 2 & 0 \\ 1 & 3 & -4 \\ 3 & 4 & 3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_3 = 0[9 - (-4)4] - 2[(3)(1) - (-4)(3)] + 0[1(4) - 3(3)]$$
  

$$\Rightarrow D_3 = 0[25] - 2(3 + 12) + 0(4 - 9)$$
  

$$\Rightarrow D_3 = 0 - 30 + 0$$
  

$$\Rightarrow D_3 = -30$$
  
Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$ 

 $\Rightarrow x = \frac{75}{15}$   $\Rightarrow x = 5$ again,  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = \frac{-45}{15}$   $\Rightarrow y = -3$ and,  $\Rightarrow z = \frac{D_3}{D}$   $\Rightarrow z = \frac{-30}{15}$   $\Rightarrow z = -2$ 

## 16. Question

Solve the following system of the linear equations by Cramer's rule:

5x - 7y + z = 116x - 8y - z = 15

3x + 2y - 6z = 7

#### Answer

Given: - Equations are: -

5x - 7y + z = 11

6x - 8y - z = 15

3x + 2y - 6z = 7

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

b<sub>1</sub> b<sub>2</sub> ։ Եր

Then,

$$x_1 \ = \ \frac{D_1}{D}$$
 ,  $x_2 \ = \ \frac{D_2}{D}$  , ... ,  $x_n \ = \ \frac{D_n}{D}$  provided that D  $\neq 0$ 

Now, here we have

5x - 7y + z = 11

6x - 8y - z = 15

3x + 2y - 6z = 7

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 5 & -7 & 1 \\ 6 & -8 & -1 \\ 3 & 2 & -6 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

 $\Rightarrow D = 5[(-8)(-6) - (-1)(2)] - 7[(-6)(6) - 3(-1)] + 1[2(6) - 3(-8)]$  $\Rightarrow D = 5[48 + 2] - 7[-36 + 3] + 1[12 + 24]$  $\Rightarrow D = 250 - 231 + 36$  $\Rightarrow D = 55$ 

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 11\\15\\7 \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} 11 & -7 & 1\\15 & -8 & -1\\7 & 2 & -6 \end{vmatrix}$$

Solving determinant, expanding along  $1^{st}$  Row  $\Rightarrow D_1 = 11[(-8)(-6) - (2)(-1)] - (-7)[(15)(-6) - (-1)(7)] + 1[(15)2 - (7)(-8)]$   $\Rightarrow D_1 = 11[48 + 2] + 7[ - 90 + 7] + 1[30 + 56]$   $\Rightarrow D_1 = 11[50] + 7[ - 83] + 86$   $\Rightarrow D_1 = 550 - 581 + 86$   $\Rightarrow D_1 = 55$ 

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

 $B = \begin{vmatrix} 11\\15\\7 \end{vmatrix}$  $\Rightarrow D_2 = \begin{vmatrix} 5 & 11 & 1\\6 & 15 & -1\\3 & 7 & -6 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_2 = 5[(15)(-6) - (7)(-1)] - 11[(6)(-6) - (-1)(3)] + 1[(6)7 - (15)(3)]$$
$$\Rightarrow D_2 = 5[-90 + 7] - 11[-36 + 3] + 1[42 - 45]$$

 $\Rightarrow D_2 = 5[-83] - 11(-33) - 3$ 

```
\Rightarrow D_2 = -415 + 363 - 3
```

And, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

Here

$$B = \begin{vmatrix} 11\\15\\7 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 5 & -7 & 11\\6 & -8 & 15\\3 & 2 & 7 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

 $\Rightarrow D_3 = 5[(-8)(7) - (15)(2)] - (-7)[(6)(7) - (15)(3)] + 11[(6)2 - (-8)(3)]$   $\Rightarrow D_3 = 5[-56 - 30] - (-7)[42 - 45] + 11[12 + 24]$   $\Rightarrow D_3 = 5[-86] + 7[-3] + 11[36]$   $\Rightarrow D_3 = -430 - 21 + 396$  $\Rightarrow D_3 = -55$ 

Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$   $\Rightarrow x = \frac{55}{55}$   $\Rightarrow x = 1$ again,  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = -\frac{55}{55}$   $\Rightarrow y = -1$ and,  $\Rightarrow z = \frac{D_3}{D}$   $\Rightarrow z = -\frac{55}{55}$   $\Rightarrow z = -1$  **17. Question**Solve the following system of the linear equations by Cramer's rule:

2x - 3y - 4z = 29- 2x + 5y - z = -153x - y + 5z = -11**Answer** Given: - Equations are: -

2x - 3y - 4z = 29

-2x + 5y - z = -15

3x - y + 5z = -11

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{1n}x_{n} = b_{1}$$

$$a_{21}x_{1} + a_{22}x_{2} + \dots + a_{2n}x_{n} = b_{2}$$

$$\vdots \vdots$$

$$a_{n1}x_{1} + a_{n2}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

$$a_{11}x_{1} + a_{12}x_{2} + \dots + a_{nn}x_{n} = b_{n}$$

Let D = 
$$\begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

2x - 3y - 4z = 29

-2x + 5y - z = -15

$$3x - y + 5z = -11$$

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 2 & -3 & -4 \\ -2 & 5 & -1 \\ 3 & -1 & 5 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D = 2[(5)(5) - (-1)(-1)] - (-3)[(-2)(5) - 3(-1)] + (-4)[(-2)(-1) - 3(5)]$$
  
$$\Rightarrow D = 2[25 - 1] + 3[-10 + 3] - 4[2 - 15]$$
  
$$\Rightarrow D = 48 - 21 + 52$$
  
$$\Rightarrow D = 79$$

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 29 \\ -15 \\ -11 \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} 29 & -3 & -4 \\ -15 & 5 & -1 \\ -11 & -1 & 5 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_{1} = 29[(5)(5) - (-1)(-1)] - (-3)[(-15)(5) - (-11)(-1)] + (-4)[(-15)(-1) - (-11)(5)]$$
  

$$\Rightarrow D_{1} = 29[25 - 1] + 3[-75 - 11] - 4[15 + 55]$$
  

$$\Rightarrow D_{1} = 29[24] + 3[-86] - 4(70)$$
  

$$\Rightarrow D_{1} = 696 - 258 - 280$$
  

$$\Rightarrow D_{1} = 158$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} 29 \\ -15 \\ -11 \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 2 & 29 & -4 \\ -2 & -15 & -1 \\ 3 & -11 & 5 \end{vmatrix}$$

Solving determinant, expanding along  $1^{st}$  Row

$$\Rightarrow D_2 = 2[(-15)(5) - (-11)(-1)] - 29[(-2)(5) - 3(-1)] + (-4)[(-11)(-2) - 3(-15)]$$
  

$$\Rightarrow D_2 = 2[-75 - 11] - 29(-10 + 3) - 4(22 + 45)$$
  

$$\Rightarrow D_2 = 2[-86] - 29(-7) - 4(67)$$
  

$$\Rightarrow D_2 = -172 + 203 - 268$$
  

$$\Rightarrow D_2 = -237$$

And, Solve  $D_3$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 29 \\ -15 \\ -11 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 2 & -3 & 29 \\ -2 & 5 & -15 \\ 3 & -1 & -11 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_{3} = 2[(5)(-11) - (-15)(-1)] - (-3)[(-11)(-2) - (-15)(3)] + 29[(-2)(-1) - (3)(5)]$$
  

$$\Rightarrow D_{3} = 2[-55 - 15] + 3(22 + 45) + 29(2 - 15)$$
  

$$\Rightarrow D_{3} = 2[-70] + 3[67] + 29[-13]$$
  

$$\Rightarrow D_{3} = -140 + 201 - 377$$
  

$$\Rightarrow D_{3} = -316$$
  
Thus by Cramer's Rule, we have  

$$\Rightarrow x = \frac{D_{1}}{D}$$
  

$$\Rightarrow x = \frac{158}{79}$$
  

$$\Rightarrow x = 2$$

again,

 $\Rightarrow y = \frac{D_2}{D}$  $\Rightarrow y = \frac{-237}{79}$  $\Rightarrow y = -3$ and, $\Rightarrow z = \frac{D_3}{2}$ 

$$\Rightarrow Z = \frac{-3}{D}$$
$$\Rightarrow Z = \frac{-316}{79}$$

## 18. Question

Solve the following system of the linear equations by Cramer's rule:

x + y = 1x + z = -6x - y - 2z = 3

#### Answer

Given: - Equations are: -

x + y = 1

x + z = -6

$$x - y - 2z = 3$$

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots \vdots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \\ \end{aligned}$$

$$Let D = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_j$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

b<sub>1</sub> b<sub>2</sub> : b<sub>n</sub>

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

x + y = 1

x + z = -6

x - y - 2z = 3

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  and  $\mathsf{D}_2$ 

$$\Rightarrow D = \begin{vmatrix} 1 & 1 & 0 \\ 1 & 0 & 1 \\ 1 & -1 & -2 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D = 1[(0)(-2) - (1)(-1)] - 1[(-2)(1) - 1] + 0[-1 - 0]$$
  
$$\Rightarrow D = 1[0 + 1] - 1[-3] - 0[-2]$$
  
$$\Rightarrow D = 1 + 3 + 0$$
  
$$\Rightarrow D = 4$$

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

$$B = \begin{vmatrix} 1 \\ -6 \\ 3 \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} 1 & 1 & 0 \\ -6 & 0 & 1 \\ 3 & -1 & -2 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_{1} = 1[(0)(-2) - (1)(-1)] - 1[(-2)(-6) - 3] + 0[6 - 0]$$
  

$$\Rightarrow D_{1} = 1[0 + 1] - 1[12 - 3] + 0[6]$$
  

$$\Rightarrow D_{1} = 1[1] - 9 + 0$$
  

$$\Rightarrow D_{1} = 1 - 9 + 0$$
  

$$\Rightarrow D_{1} = - 8$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} 1 \\ -6 \\ 3 \end{vmatrix}$$
  

$$\Rightarrow D_2 = \begin{vmatrix} 1 & 1 & 0 \\ 1 & -6 & 1 \\ 1 & 3 & -2 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\begin{array}{l} \Rightarrow \mathsf{D}_2 = 1[(-6)(-2) - (1)(3)] - 1[(-2)(1) - 1] + 0[3 + 6] \\ \Rightarrow \mathsf{D}_2 = 1[12 - 3] - 1(-2 - 1) + 0(9) \\ \Rightarrow \mathsf{D}_2 = 9 + 3 \\ \Rightarrow \mathsf{D}_2 = 9 + 3 \\ \Rightarrow \mathsf{D}_2 = 12 \\ \end{array}$$
And, Solve  $\mathsf{D}_3$  formed by replacing 3<sup>rd</sup> column by B matrices Here

$$B = \begin{vmatrix} 1 \\ -6 \\ 3 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 0 & -6 \\ 1 & -1 & 3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_3 = 1[(0)(3) - (-1)(-6)] - 1[(3)(1) - 1(-6)] + 1[-1+0]$$

$$\Rightarrow D_3 = 1[0-6] - 1(3+6) + 1(-1)$$

$$\Rightarrow D_3 = -6 - 9 - 1$$

$$\Rightarrow D_3 = -16$$

Thus by Cramer's Rule, we have

 $\Rightarrow \mathbf{x} = \frac{\mathbf{D}_1}{\mathbf{D}}$   $\Rightarrow \mathbf{x} = \frac{-\mathbf{8}}{4}$   $\Rightarrow \mathbf{x} = -2$ again,  $\Rightarrow \mathbf{y} = \frac{\mathbf{D}_2}{\mathbf{D}}$   $\Rightarrow \mathbf{y} = \frac{\mathbf{12}}{4}$   $\Rightarrow \mathbf{y} = 3$ and,  $\Rightarrow \mathbf{z} = \frac{\mathbf{D}_3}{\mathbf{D}}$   $\Rightarrow \mathbf{z} = -\frac{\mathbf{16}}{4}$   $\Rightarrow \mathbf{z} = -4$ 

## 19. Question

Solve the following system of the linear equations by Cramer's rule:

x + y + z + 1 = 0 ax + by + cz + d = 0  $a^{2}x + b^{2}y + c^{2}z + d^{2} = 0$ **Answer** 

Given: - Equations are: -

x + y + z + 1 = 0

ax + by + cz + d = 0

 $a^2x + b^2y + c^2z + d^2 = 0$ 

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

 $a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$ 

$$\begin{aligned} a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots \vdots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \\ \\ \text{Let } D &= \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix} \end{aligned}$$

and let  $\mathsf{D}_{j}$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

b<sub>1</sub> b<sub>2</sub> : b<sub>n</sub>

Then,

$$x_1 = \frac{D_1}{D}$$
,  $x_2 = \frac{D_2}{D}$ , ...,  $x_n = \frac{D_n}{D}$  provided that  $D \neq 0$ 

Now, here we have

x + y + z + 1 = 0

ax + by + cz + d = 0

$$a^2x + b^2y + c^2z + d^2 = 0$$

So by comparing with theorem, lets find D ,  $\mathsf{D}_1$  ,  $\mathsf{D}_2$  and  $\mathsf{D}_3$ 

$$\Rightarrow D = \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow c_3 - c_1$ 

$$\Rightarrow D = \begin{vmatrix} 1 & 0 & 0 \\ a & b-a & c-a \\ a^2 & b^2 - a^2 & c^2 - a^2 \end{vmatrix}$$

Take (b – a) from  $c_2$  , and (c – a) from  $c_3$  common, we get

$$\Rightarrow D = (b-a)(c-a) \begin{vmatrix} 1 & 0 & 0 \\ a & 1 & 1 \\ a^2 & b+a & c+a \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D = (b - a)(c - a)1[c + a - (b + a)]$$
  

$$\Rightarrow D = (b - a)(c - a)(c + a - b - a)$$
  

$$\Rightarrow D = (b - a)(c - a)(c - b)$$
  

$$\Rightarrow D = (a - b)(b - c)(c - a)$$

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

$$\mathbf{B} = \begin{vmatrix} -1 \\ -d \\ -d^2 \end{vmatrix}$$

$$\Rightarrow D_{1} = \begin{vmatrix} -1 & 1 & 1 \\ -d & b & c \\ -d^{2} & b^{2} & c^{2} \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow c_3 - c_1$ 

$$\Rightarrow D_{1} = - \begin{vmatrix} 1 & 0 & 0 \\ d & b - d & c - d \\ d^{2} & b^{2} - d^{2} & c^{2} - d^{2} \end{vmatrix}$$

Take (b – d) from  $c_2$  , and (c – d) from  $c_3$  common, we get

$$\Rightarrow D_1 = -(b-d)(c-d) \begin{vmatrix} 1 & 0 & 0 \\ d & 1 & 1 \\ d^2 & b+d & c+d \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_{1} = -(b - d)(c - d)\mathbf{1}[c + d - (b + d)]$$
  

$$\Rightarrow D_{1} = -(b - d)(c - d)(c + d - b - d)$$
  

$$\Rightarrow D_{1} = -(b - d)(c - d)(c - b)$$
  

$$\Rightarrow D_{1} = -(d - b)(b - c)(c - d)$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} -1 \\ -d \\ -d^2 \end{vmatrix}$$

$$\begin{vmatrix} 1 & -1 \end{vmatrix}$$

$$\Rightarrow D_2 = \begin{vmatrix} a & -d & c \\ a^2 & -d^2 & c^2 \end{vmatrix}$$

applying,  $\mathbf{c_2} \rightarrow \mathbf{c_2} - \mathbf{c_1}, \mathbf{c_3} \rightarrow \mathbf{c_3} - \mathbf{c_1}$ 

$$\Rightarrow D_2 = - \begin{vmatrix} 1 & 0 & 0 \\ a & d-a & c-a \\ a^2 & d^2-a^2 & c^2-a^2 \end{vmatrix}$$

Take (d – a) from  $c_2$  , and (c – a) from  $c_3$  common, we get

$$\Rightarrow D_2 = -(d-a)(c-a) \begin{vmatrix} 1 & 0 & 0 \\ a & 1 & 1 \\ a^2 & d+a & c+a \end{vmatrix}$$

1

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_2 = -(d - a)(c - a)1[c + a - (d + a)]$$

$$\Rightarrow D_2 = - (d - a)(c - a)(c + a - d - a)$$

$$\Rightarrow D_2 = - (d - a)(c - a)(c - d)$$

$$\Rightarrow D_2 = - (a - d)(d - c)(c - a)$$

And, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

Here

 $B = \begin{vmatrix} -1 \\ -d \\ -d^2 \end{vmatrix}$ 

$$\Rightarrow D_3 = \begin{vmatrix} 1 & 1 & -1 \\ a & b & -d \\ a^2 & b^2 & -d^2 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow c_3 - c_1$ 

$$\Rightarrow D_3 = - \begin{vmatrix} 1 & 0 & 0 \\ a & b-a & d-a \\ a^2 & b^2 - a^2 & d^2 - d^2 \end{vmatrix}$$

Take (b – a) from  $c_2$  , and (d – a) from  $c_3$  common, we get

$$\Rightarrow D_3 = -(b-a)(d-a) \begin{vmatrix} 1 & 0 & 0 \\ a & 1 & 1 \\ a^2 & b+a & d+a \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_3 = -(b - d)(c - d)1[a + d - (b + a)]$$
  

$$\Rightarrow D_3 = -(b - d)(c - d)(a + d - b - a)$$
  

$$\Rightarrow D_3 = -(b - d)(c - d)(d - b)$$
  

$$\Rightarrow D_3 = -(d - b)(b - d)(c - d)$$

Thus by Cramer's Rule, we have

$$\Rightarrow X = \frac{D_1}{D}$$
$$\Rightarrow X = -\frac{(b-c)(c-d)(d-b)}{(a-b)(b-c)(c-a)}$$

again,

$$\Rightarrow y = \frac{D_2}{D}$$
$$\Rightarrow y = -\frac{(a-d)(d-c)(c-a)}{(a-b)(b-c)(c-a)}$$

and,

$$\Rightarrow Z = \frac{D_a}{D}$$
$$\Rightarrow Z = -\frac{(a-b)(b-d)(d-a)}{(a-b)(b-c)(c-a)}$$

#### 20. Question

Solve the following system of the linear equations by Cramer's rule:

x + y + z + w = 2 x - 2y + 2z + 2w = -6 2x + y - 2z + 2w = -53x - y + 3z - 3w = -3

### Answer

Given: - Equations are: x + y + z + w = 2 x - 2y + 2z + 2w = -62x + y - 2z + 2w = -5

3x - y + 3z - 3w = -3

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$
  

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$
  

$$\vdots \vdots$$
  

$$a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n = b_n$$

Let D = 
$$\begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix}$$

and let  $\mathsf{D}_{j}$  be the determinant obtained from D after replacing the  $j^{\text{th}}$  column by

Then,

$$x_1 \ = \ \frac{D_1}{D}$$
 ,  $x_2 \ = \ \frac{D_2}{D}$  , ... ,  $x_n \ = \ \frac{D_n}{D}$  provided that D  $\neq 0$ 

Now, here we have

x + y + z + w = 2 x - 2y + 2z + 2w = -62x + y - 2z + 2w = -5

$$3x - y + 3z - 3w = -3$$

So by comparing with theorem, lets find D,  $\mathsf{D}_1,\,\mathsf{D}_2,\mathsf{D}_3$  and  $\mathsf{D}_4$ 

$$\Rightarrow D = \begin{vmatrix} 1 & 1 & 1 & 1 \\ 1 & -2 & 2 & 2 \\ 2 & 1 & -2 & 2 \\ 3 & -1 & 3 & -3 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow c_3 - c_1, c_4 \rightarrow c_4 - c_1$ 

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 1 & 0 & 0 & 0 \\ 1 & -3 & 1 & 1 \\ 2 & -1 & -4 & 0 \\ 3 & -4 & 0 & -6 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D = 1 \begin{vmatrix} -3 & 1 & 1 \\ -1 & -4 & 0 \\ -4 & 0 & -6 \end{vmatrix}$$

applying,  $c_1 \rightarrow c_1 + 3c_3, c_2 \rightarrow c_2 - c_3$ 

$$\Rightarrow D = 1 \begin{vmatrix} 0 & 0 & 1 \\ -1 & -4 & 0 \\ -22 & 6 & -6 \end{vmatrix}$$
$$\Rightarrow D = 1[-6 - 88]$$

## Again, Solve $D_1$ formed by replacing $1^{st}$ column by B matrices

Here

$$B = \begin{vmatrix} 2 \\ -6 \\ -5 \\ -3 \end{vmatrix}$$
$$\Rightarrow D_{1} = \begin{vmatrix} 2 & 1 & 1 & 1 \\ -6 & -2 & 2 & 2 \\ -5 & 1 & -2 & 2 \\ -3 & -1 & 3 & -3 \end{vmatrix}$$

applying,  $c_1 \rightarrow c_1 - 2c_4, c_2 \rightarrow c_2 - c_4, c_3 \rightarrow \ c_3 - c_4$ 

$$\Rightarrow D_1 = \begin{vmatrix} 0 & 0 & 0 & 1 \\ -10 & -4 & 0 & 2 \\ -9 & -1 & -4 & 2 \\ 3 & 2 & 6 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_{1} = -1 \begin{vmatrix} -10 & -4 & 0 \\ -9 & -1 & -4 \\ 3 & 2 & 6 \end{vmatrix}$$

$$\Rightarrow D_{1} = -1\{(-10)[6(-1) - 2(-4)] - (-4)[(-9)6 - (-4)3] + 0\}$$

$$\Rightarrow D_{1} = -1\{-10[-6 + 8] + 4[-54 + 12]\}$$

$$\Rightarrow D_{1} = -1\{-10[2] + 4[-42]\}$$

$$\Rightarrow D_{1} = 188$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} 2 \\ -6 \\ -5 \\ -3 \end{vmatrix}$$

$$\Rightarrow D_2 = \begin{vmatrix} 1 & 2 & 1 & 1 \\ 1 & -6 & 2 & 2 \\ 2 & -5 & -2 & 2 \\ 3 & -3 & 3 & -3 \end{vmatrix}$$

applying,  $c_1 \rightarrow c_1 - c_4, c_2 \rightarrow c_2 - 2c_4, c_3 \rightarrow \ c_3 - c_4$ 

$$\Rightarrow D_2 = \begin{vmatrix} 0 & 0 & 0 & 1 \\ -1 & -10 & 0 & 2 \\ 0 & -9 & -4 & 2 \\ 6 & 3 & 6 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_2 = -1 \begin{vmatrix} -1 & -10 & 0 \\ 0 & -9 & -4 \\ 6 & 3 & 6 \end{vmatrix}$$
$$\Rightarrow D_2 = -1\{(-1)[6(-9) - 3(-4)] - (-10)[0 - 6(-4)] + 0[0 + 54]\}$$
$$\Rightarrow D_2 = -1\{-1[-54 + 12] + 10(24) + 0\}$$

⇒ D<sub>2</sub> = - 282

Again, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

Here

$$B = \begin{vmatrix} 2 \\ -6 \\ -5 \\ -3 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 1 & 1 & 2 & 1 \\ 1 & -2 & -6 & 2 \\ 2 & 1 & -5 & 2 \\ 3 & -1 & -3 & -3 \end{vmatrix}$$

applying,  $c_1 \rightarrow c_1 - c_4, c_2 \rightarrow c_2 - c_4, c_3 \rightarrow c_3 - 2c_4$ 

$$\Rightarrow D_3 = \begin{vmatrix} 0 & 0 & 0 & 1 \\ -1 & -4 & -10 & 2 \\ 0 & -1 & -9 & 2 \\ 6 & 2 & 3 & -3 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_3 = -1 \begin{vmatrix} -1 & -4 & -10 \\ 0 & -1 & -9 \\ 6 & 2 & 3 \end{vmatrix}$$

$$\Rightarrow D_3 = -1\{(-1)[-3 - (-9)2] - (-4)[0 - 6(-9)] + (-10)[0 + 6]\}$$

$$\Rightarrow D_3 = -1\{-1[15] + 4(54) - 10(6)\}$$

$$\Rightarrow D_3 = -1\{-15 + 216 - 60\}$$

$$\Rightarrow D_3 = -141$$

And, Solve  $D_4$  formed by replacing  $4^{th}$  column by B matrices

Here

$$B = \begin{vmatrix} 2 \\ -6 \\ -5 \\ -3 \end{vmatrix}$$

$$\Rightarrow D_4 = \begin{vmatrix} 1 & 1 & 1 & 2 \\ 1 & -2 & 2 & -6 \\ 2 & 1 & -2 & -5 \\ 3 & -1 & 3 & -3 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow c_3 - c_1$  ,  $c_4 \rightarrow c_4 - 2c_1$ 

$$\Rightarrow D_4 = \begin{vmatrix} 1 & 0 & 0 & 0 \\ 1 & -3 & 1 & -8 \\ 2 & -1 & -4 & -9 \\ 3 & -4 & 0 & -9 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> Row

$$\Rightarrow D_4 = 1 \begin{vmatrix} -3 & 1 & -8 \\ -1 & -4 & -9 \\ -4 & 0 & -9 \end{vmatrix}$$
  
$$\Rightarrow D_4 = (-3)[(-9)(-4) - 0] - 1[9 - (-4)(-9)] + (-8)[0 - 16]$$
  
$$\Rightarrow D_4 = -3[36] - 1(9 - 36) - 8(-16)$$

Get More Learning Materials Here :

 $\Rightarrow D_4 = -108 + 27 + 128$ 

$$\Rightarrow D_4 = 47$$

Thus by Cramer's Rule, we have

 $\Rightarrow x = \frac{D_1}{D}$   $\Rightarrow x = \frac{188}{-94}$   $\Rightarrow x = -2$ again,  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = \frac{-282}{-94}$   $\Rightarrow y = 3$ again,  $\Rightarrow z = \frac{D_3}{D}$   $\Rightarrow z = \frac{-141}{-94}$   $\Rightarrow z = \frac{3}{2}$ And,  $\Rightarrow w = \frac{D_4}{D}$   $\Rightarrow w = \frac{47}{-94}$ 

$$\Rightarrow W = -\frac{1}{2}$$

## 21. Question

Solve the following system of the linear equations by Cramer's rule:

2x - 3z + w = 1 x - y + 2w = 1 - 3y + z + w = 1x + y + z = 1

## Answer

Given: - Equations are: -

2x - 3z + w = 1

x - y + 2w = 1

-3y + z + w = 1

x + y + z = 1

Tip: - Theorem - Cramer's Rule

Let there be a system of n simultaneous linear equations and with n unknown given by

 $a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$ 

$$\begin{aligned} a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \vdots \vdots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \\ \\ \text{Let } D &= \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n1} & \dots & a_{nn} \end{vmatrix} \end{aligned}$$

and let  $D_j$  be the determinant obtained from D after replacing the  $j^{th}$  column by

b₁ b₂ ∶ b<sub>n</sub>

Then,

 $x_1~=~\frac{D_1}{D}$  ,  $x_2~=~\frac{D_2}{D}$  , ... ,  $x_n~=~\frac{D_n}{D}$  provided that D  $\neq$  0

Now, here we have

2x - 3z + w = 1 x - y + 2w = 1 - 3y + z + w = 1x + y + z = 1

So by comparing with theorem, lets find D,  $D_1$ ,  $D_2$ ,  $D_3$  and  $D_4$ 

$$\Rightarrow D = \begin{vmatrix} 2 & 0 & -3 & 1 \\ 1 & -1 & 0 & 2 \\ 0 & -3 & 1 & 1 \\ 1 & 1 & 1 & 0 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow c_3 - c_1$ 

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 2 & -2 & -5 & 1 \\ 1 & -2 & -1 & 2 \\ 0 & -3 & 1 & 1 \\ 1 & 0 & 0 & 0 \end{vmatrix}$$

Solving determinant, expanding along 4<sup>th</sup> Row

 $\Rightarrow D = -1 \begin{vmatrix} -2 & -5 & 1 \\ -2 & -1 & 2 \\ -3 & 1 & 1 \end{vmatrix}$ 

applying,  $c_1 \rightarrow c_1 + 3c_3, c_2 \rightarrow c_2 - c_3$ 

$$\Rightarrow D = 1 \begin{vmatrix} 1 & -6 & 1 \\ 4 & -3 & 2 \\ 0 & 0 & 1 \end{vmatrix}$$

expanding along 3<sup>rd</sup> row

$$\Rightarrow D = -1[-3-(-6)4]$$

Again, Solve  $\mathsf{D}_1$  formed by replacing  $\mathbf{1}^{st}$  column by B matrices

**CLICK HERE** 

≫

Regional www.studentbro.in

Here

$$\mathbf{B} = \begin{bmatrix} 1\\1\\1\\1\\1 \end{bmatrix}$$

$$\Rightarrow D_1 = \begin{vmatrix} 1 & 0 & -3 & 1 \\ 1 & -1 & 0 & 2 \\ 1 & -3 & 1 & 1 \\ 1 & 1 & 1 & 0 \end{vmatrix}$$

applying,  $\textbf{c}_3 \rightarrow~\textbf{c}_3~+~3\textbf{c}_1, \textbf{c}_4 \rightarrow~\textbf{c}_4-\textbf{c}_1$ 

$$\Rightarrow D_1 = \begin{vmatrix} 1 & 0 & 0 & 0 \\ 1 & -1 & 3 & 1 \\ 1 & -3 & 4 & 0 \\ 1 & 1 & 4 & -1 \end{vmatrix}$$

Solving determinant, expanding along  $1^{st}$  Row

$$\Rightarrow D_{1} = 1 \begin{vmatrix} -1 & 3 & 1 \\ -3 & 4 & 0 \\ 1 & 4 & -1 \end{vmatrix}$$
$$\Rightarrow D_{1} = (-1)[(4)(-1) - 0(4)] - (3)[(-3)(-1) - 0] + 1[-12 - 4]$$
$$\Rightarrow D_{1} = -1[-4 - 0] - 3[3 - 0] - 16$$
$$\Rightarrow D_{1} = 4 - 9 - 16$$
$$\Rightarrow D_{1} = -21$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} 1 \\ 1 \\ 1 \\ 1 \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 2 & 1 & -3 & 1 \\ 1 & 1 & 0 & 2 \\ 0 & 1 & 1 & 1 \\ 1 & 1 & 1 & 0 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow \ c_3 - c_1$ 

 $\Rightarrow D_2 = \begin{vmatrix} 2 & -1 & -5 & 1 \\ 1 & 0 & -1 & 2 \\ 0 & 1 & 1 & 1 \\ 1 & 0 & 0 & 0 \end{vmatrix}$ 

Solving determinant, expanding along 4<sup>th</sup> Row

$$\Rightarrow D_2 = -1 \begin{vmatrix} -1 & -5 & 1 \\ 0 & -1 & 2 \\ 1 & 1 & 1 \end{vmatrix}$$

$$\Rightarrow D_2 = -1\{(-1)[1(-1) - 1(2)] - (-5)[0 - 1(2)] + 1[0 - (-1)]\}$$

$$\Rightarrow D_2 = -1\{-1[-1 - 2] + 5(-2) + 1\}$$

$$\Rightarrow D_2 = 6$$

Again, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

**CLICK HERE** 

>>

🕀 www.studentbro.in

Here

$$B = \begin{vmatrix} 1 \\ 1 \\ 1 \\ 1 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 2 & 0 & 1 & 1 \\ 1 & -1 & 1 & 2 \\ 0 & -3 & 1 & 1 \\ 1 & 1 & 1 & 0 \end{vmatrix}$$

applying,  $\mathbf{c_2} \rightarrow \mathbf{c_2} - \mathbf{c_1}, \mathbf{c_3} \rightarrow \ \mathbf{c_3} - \mathbf{c_1}$ 

$$\Rightarrow D_3 = \begin{vmatrix} 2 & -2 & -1 & 1 \\ 1 & -2 & 0 & 2 \\ 0 & -3 & 1 & 1 \\ 1 & 0 & 0 & 0 \end{vmatrix}$$

Solving determinant, expanding along 4<sup>th</sup> Row

$$\Rightarrow D_3 = -1 \begin{vmatrix} -2 & -1 & 1 \\ -2 & 0 & 2 \\ -3 & 1 & 1 \end{vmatrix}$$

$$\Rightarrow D_3 = -1\{(-2)[0 - (1)2] - (-1)[-2 - (-3)(2)] + 1[-2 - 0]\}$$

$$\Rightarrow D_3 = -1\{-2[-2] + 1(-2 + 6) + 1(-2)\}$$

$$\Rightarrow D_3 = -1\{4 + 4 - 2\}$$

$$\Rightarrow D_3 = -6$$

And, Solve  $\mathsf{D}_4$  formed by replacing  $4^{th}$  column by B matrices

Here

$$B = \begin{vmatrix} 1 \\ 1 \\ 1 \\ 1 \end{vmatrix}$$
$$\Rightarrow D_4 = \begin{vmatrix} 2 & 0 & -3 & 1 \\ 1 & -1 & 0 & 1 \\ 0 & -3 & 1 & 1 \\ 1 & 1 & 1 & 1 \end{vmatrix}$$

applying,  $c_2 \rightarrow c_2 - c_1, c_3 \rightarrow \ c_3 - c_1, c_4 \rightarrow \ c_4 - c_1$ 

$$\Rightarrow D_4 = \begin{vmatrix} 2 & -2 & -5 & -1 \\ 1 & -2 & -1 & 0 \\ 0 & -3 & 1 & 1 \\ 1 & 0 & 0 & 0 \end{vmatrix}$$

Solving determinant, expanding along 4<sup>th</sup> Row

$$\begin{array}{l} \Rightarrow D_4 = -1 \begin{vmatrix} -2 & -5 & -1 \\ -2 & -1 & 0 \\ -3 & 1 & 1 \end{vmatrix}$$
$$\begin{array}{l} \Rightarrow D_4 = (-1)\{(-2)[(-1)1 - 0] - (-5)[-2 - 0] + (-1)[-2 - 3]\} \\ \Rightarrow D_4 = (-1)\{2 - 10 + 5\} \\ \Rightarrow D_4 = 3 \\ \Rightarrow D_4 = 3 \end{array}$$
$$\begin{array}{l} \Rightarrow D_4 = 3 \\ \end{array}$$
Thus by Cramer's Rule, we have

$$\Rightarrow \mathbf{x} = \frac{\mathbf{D}_1}{\mathbf{D}}$$
$$\Rightarrow \mathbf{x} = \frac{-21}{-21}$$
$$\Rightarrow \mathbf{x} = 1$$

again,

 $\Rightarrow y = \frac{D_2}{D}$  $\Rightarrow y = \frac{6}{-21}$ 

$$\Rightarrow$$
 y =  $-\frac{2}{7}$ 

again,

$$\Rightarrow Z = \frac{D_3}{D}$$
$$\Rightarrow Z = \frac{-6}{-21}$$
$$\Rightarrow Z = \frac{2}{7}$$

$$\Rightarrow W = \frac{D_4}{D}$$
$$\Rightarrow W = \frac{3}{-21}$$
$$\Rightarrow W = -\frac{1}{7}$$

# 22. Question

Show that each of the following systems of linear equations is inconsistent:

2x - y = 5

4x - 2y = 7

# Answer

Given: - Two equation 2x - y = 5 and 4x - 2y = 7

Tip: - We know that

For a system of 2 simultaneous linear equation with 2 unknowns

(i) If D  $\neq$  0, then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}, y = \frac{D_2}{D}$$

(ii) If D = 0 and  $D_1 = D_2 = 0$ , then the system is consistent and has infinitely many solution.

(iii) If D = 0 and one of  $D_1$  and  $D_2$  is non – zero, then the system is inconsistent.

Now,

We have,

2x - y = 54x - 2y = 7Lets find D

 $\Rightarrow D = \begin{vmatrix} 2 & -1 \\ 4 & -2 \end{vmatrix}$  $\Rightarrow D = -4 + 4$  $\Rightarrow D = 0$ 

Again,  $D_1$  by replacing 1<sup>st</sup> column by B

Here

 $B = \begin{vmatrix} 5 \\ 7 \end{vmatrix}$  $\Rightarrow D_1 = \begin{vmatrix} 5 & -1 \\ 7 & -2 \end{vmatrix}$  $\Rightarrow D_1 = -10 + 7$  $\Rightarrow D_1 = -3$ 

And,  $D_2$  by replacing 2<sup>nd</sup> column by B

Here

 $B = \begin{vmatrix} 5 \\ 7 \end{vmatrix}$  $\Rightarrow D_2 = \begin{vmatrix} 2 & 5 \\ 4 & 7 \end{vmatrix}$  $\Rightarrow D_2 = 14 - 20$  $\Rightarrow D_2 = -6$ 

So, here we can see that

 $\mathsf{D}=\mathsf{0}$  and  $\mathsf{D}_1$  and  $\mathsf{D}_2$  are non – zero

Hence the given system of equation is inconsistent.

# 23. Question

Show that each of the following systems of linear equations is inconsistent:

3x + y = 5

-6x - 2y = 9

# Answer

Given: - Two equation 3x + y = 5 and -6x - 2y = 9

Tip: - We know that

For a system of 2 simultaneous linear equation with 2 unknowns

(i) If D  $\neq$  0, then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}, y = \frac{D_2}{D}$$

(ii) If D = 0 and  $D_1 = D_2 = 0$ , then the system is consistent and has infinitely many solution.

(iii) If D = 0 and one of  $D_1$  and  $D_2$  is non – zero, then the system is inconsistent.

Now,

We have,

3x + y = 5

- 6x - 2y = 9Lets find D  $\Rightarrow D = \begin{vmatrix} 3 & 1 \\ -6 & -2 \end{vmatrix}$  $\Rightarrow D = -6 - 6$  $\Rightarrow D = 0$ Again, D<sub>1</sub> by replacing 1<sup>st</sup> column by B

, igani, bi by replacing r

 $B = \begin{vmatrix} 5 \\ 9 \end{vmatrix}$  $\Rightarrow D_1 = \begin{vmatrix} 5 & 1 \\ 9 & -2 \end{vmatrix}$  $\Rightarrow D_1 = -10 - 9$  $\Rightarrow D_1 = -19$ 

And,  $D_2$  by replacing  $2^{nd}$  column by B

Here

Here

 $B = \begin{bmatrix} 5 \\ 9 \end{bmatrix}$ 

 $\Rightarrow D_2 = \begin{vmatrix} 3 & 5 \\ -6 & 9 \end{vmatrix}$ 

 $\Rightarrow D_2 = 27 + 30$ 

So, here we can see that

 $\mathsf{D}=\mathsf{0}$  and  $\mathsf{D}_1$  and  $\mathsf{D}_2$  are non – zero

Hence the given system of equation is inconsistent.

# 24. Question

Show that each of the following systems of linear equations is inconsistent:

3x - y + 2z = 32x + y + 3z = 5x - 2y - z = 1**Answer** 

Given: - Three equation

3x - y + 2z = 3

2x + y + 3z = 5

x - 2y - z = 1

Tip: - We know that

For a system of 3 simultaneous linear equation with 3 unknowns

(i) If D  $\neq$  0, then the given system of equations is consistent and has a unique solution given by

Get More Learning Materials Here : 📕

CLICK HERE

$$x = \frac{D_1}{D}$$
,  $y = \frac{D_2}{D}$  and  $z = \frac{D_3}{D}$ 

(ii) If D = 0 and  $D_1 = D_2 = D_3 = 0$ , then the given system of equation may or may not be consistent. However if consistent, then it has infinitely many solutions.

(iii) If D = 0 and at least one of the determinants  $D_1$ ,  $D_2$  and  $D_3$  is non – zero, then the system is inconsistent.

Now,

We have,

3x - y + 2z = 3

2x + y + 3z = 5

Lets find D

 $\Rightarrow D = \begin{vmatrix} 3 & -1 & 2 \\ 2 & 1 & 3 \\ 1 & -2 & -1 \end{vmatrix}$ 

Expanding along 1<sup>st</sup> row

 $\Rightarrow D = 3[-1 - 3(-2)] - (-1)[(-1)2 - 3] + 2[-4 - 1]$  $\Rightarrow D = 3[5] + 1[-5] + 2[-5]$  $\Rightarrow D = 0$ 

Again,  $D_1$  by replacing  $1^{st}$  column by B

Here

 $B = \begin{vmatrix} 3\\5\\1 \end{vmatrix}$   $\Rightarrow D_1 = \begin{vmatrix} 3 & -1 & 2\\5 & 1 & 3\\1 & -2 & -1 \end{vmatrix}$   $\Rightarrow D_1 = 3[-1 - 3(-2)] - (-1)[(-1)5 - 3] + 2[-10 - 1]$   $\Rightarrow D_1 = 3[5] + [-8] + 2[-11]$   $\Rightarrow D_1 = 15 - 8 - 22$   $\Rightarrow D_1 = -15$  $\Rightarrow D_1 \neq 0$ 

So, here we can see that

D = 0 and  $D_1$  is non – zero

Hence the given system of equation is inconsistent.

Hence Proved

# 25. Question

Show that each of the following systems of linear equations is inconsistent:

x + y + z = 32x - y + z = 23x + 6y + 5z = 20.

#### Answer

Given: - Three equation

x + y + z = 3

2x - y + z = 2

3x + 6y + 5z = 20.

Tip: - We know that

For a system of 3 simultaneous linear equation with 3 unknowns

(i) If  $D \neq 0$ , then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}$$
,  $y = \frac{D_2}{D}$  and  $z = \frac{D_3}{D}$ 

(ii) If D = 0 and  $D_1 = D_2 = D_3 = 0$ , then the given system of equation may or may not be consistent. However if consistent, then it has infinitely many solution.

(iii) If D = 0 and at least one of the determinants  $D_1$ ,  $D_2$  and  $D_3$  is non – zero, then the system is inconsistent.

Now,

We have,

x + y + z = 3

2x - y + z = 2

3x + 6y + 5z = 20.

Lets find D

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 3 & 6 & 5 \end{vmatrix}$$

Expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D} = \mathbb{1}[-5 - \mathbb{1}(6)] - (\mathbb{1})[(5)2 - 3] + \mathbb{1}[\mathbb{1}2 + 3]$ 

 $\Rightarrow \mathsf{D} = 1[-11] - 1[7] + 1[15]$ 

So, here we can see that

D ≠ 0

Hence the given system of equation is consistent.

#### 26. Question

Show that each of the following systems of linear equations has infinite number of solutions and solve:

x - y + z = 3 2x + y - z = 2 - x - 2y + 2z = 1 **Answer** Given: - Three equation

x - y + z = 32x + y - z = 2-x - 2y + 2z = 1

Tip: - We know that

For a system of 3 simultaneous linear equation with 3 unknowns

(i) If  $D \neq 0$ , then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}$$
,  $y = \frac{D_2}{D}$  and  $z = \frac{D_3}{D}$ 

(ii) If D = 0 and  $D_1 = D_2 = D_3 = 0$ , then the given system of equation may or may not be consistent. However if consistent, then it has infinitely many solution.

(iii) If D = 0 and at least one of the determinants  $D_1$ ,  $D_2$  and  $D_3$  is non – zero, then the system is inconsistent.

Now,

We have,

x - y + z = 32x + y - z = 2

-x - 2y + 2z = 1

Lets find D

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 1 & -1 & 1 \\ 2 & 1 & -1 \\ -1 & -2 & 2 \end{vmatrix}$$

Expanding along 1<sup>st</sup> row

$$\Rightarrow D = 1[2 - (-1)(-2)] - (-1)[(2)2 - (1)] + 1[-4 - (-1)]$$
$$\Rightarrow D = 1[0] + 1[3] + [-3]$$

Again,  $D_1$  by replacing 1<sup>st</sup> column by B

Here

$$B = \begin{vmatrix} 3\\2\\1 \end{vmatrix}$$
  

$$\Rightarrow D_{1} = \begin{vmatrix} 3 & -1 & 1\\2 & 1 & -1\\1 & -2 & 2 \end{vmatrix}$$
  

$$\Rightarrow D_{1} = 3[2 - (-1)(-2)] - (-1)[(2)2 - (-1)] + 1[-4 - 1]$$
  

$$\Rightarrow D_{1} = 3[2 - 2] + [4 + 1] + 1[-5]$$
  

$$\Rightarrow D_{1} = 0 + 5 - 5$$
  

$$\Rightarrow D_{1} = 0$$
  
Also, D<sub>2</sub> by replacing 2<sup>nd</sup> column by B

Here

 $B = \begin{vmatrix} 3 \\ 2 \\ 1 \end{vmatrix}$  $\Rightarrow D_2 = \begin{vmatrix} 1 & 3 & 1 \\ 2 & 2 & -1 \\ -1 & 1 & 2 \end{vmatrix}$ 

 $\Rightarrow D_2 = 1[4 - (-1)(1)] - (3)[(2)2 - (1)] + 1[2 - (-2)]$  $\Rightarrow D_2 = 1[4 + 1] - 3[4 - 1] + 1[4]$  $\Rightarrow D_2 = 5 - 9 + 4$  $\Rightarrow D_2 = 0$ 

Again,  $D_3$  by replacing  $3^{rd}$  column by B

Here

 $B = \begin{vmatrix} 3\\2\\1 \end{vmatrix}$   $\Rightarrow D_3 = \begin{vmatrix} 1 & -1 & 3\\2 & 1 & 2\\-1 & -2 & 1 \end{vmatrix}$   $\Rightarrow D_3 = 1[1 - (-2)(2)] - (-1)[(2)1 - 2(-1)] + 3[2(-2) - 1(-1)]$   $\Rightarrow D_3 = [1 + 4] + [2 + 2] + 3[-4 + 1]$   $\Rightarrow D_3 = 5 + 4 - 9$  $\Rightarrow D_3 = 0$ 

So, here we can see that

$$D = D_1 = D_2 = D_3 = 0$$

Thus,

Either the system is consistent with infinitely many solutions or it is inconsistent.

Now, by 1<sup>st</sup> two equations, written as

x - y = 3 - z

2x + y = 2 + z

Now by applying Cramer's rule to solve them,

New D and  $D_1$ ,  $D_2$ 

$$\Rightarrow D = \begin{vmatrix} 1 & -1 \\ 2 & 1 \end{vmatrix}$$
$$\Rightarrow D = 1 + 2$$
$$\Rightarrow D = 3$$

Again,  $D_1$  by replacing 1<sup>st</sup> column with

$$B = \begin{vmatrix} 3 - z \\ 2 + z \end{vmatrix}$$
  

$$\Rightarrow D_1 = \begin{vmatrix} 3 - z & -1 \\ 2 + z & 1 \end{vmatrix}$$
  

$$\Rightarrow D_1 = 3 - z - (-1)(2 + z)$$
  

$$\Rightarrow D_1 = 5$$

Again,  $D_2$  by replacing  $2^{nd}$  column with

$$B = \begin{vmatrix} 3 - z \\ 2 + z \end{vmatrix}$$

 $\Rightarrow D_2 = \begin{vmatrix} 1 & 3-z \\ 2 & 2+z \end{vmatrix}$  $\Rightarrow D_2 = 2 + z - 2 (3 - z)$  $\Rightarrow D_2 = -4 + 3z$ Hence, using Cramer's rule

 $\Rightarrow x = \frac{D_1}{D}$   $\Rightarrow x = \frac{5}{3}$ again,  $\Rightarrow y = \frac{D_2}{D}$   $\Rightarrow y = \frac{-4+3z}{3}$ Let, z = kThen  $y = \frac{-4+3k}{3}$ 

And z = k

By changing value of k you may get infinite solutions

### 27. Question

Show that each of the following systems of linear equations has infinite number of solutions and solve:

x + 2y = 5

3x + 6y = 15

#### Answer

Given: - Two equation x + 2y = 5 and 3x + 6y = 15

Tip: - We know that

For a system of 2 simultaneous linear equation with 2 unknowns

(iv) If D  $\neq$  0, then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}, y = \frac{D_2}{D}$$

(v) If D = 0 and  $D_1 = D_2 = 0$ , then the system is consistent and has infinitely many solution.

(vi) If D = 0 and one of  $D_1$  and  $D_2$  is non – zero, then the system is inconsistent.

Now,

We have,

x + 2y = 5 3x + 6y = 15Lets find D  $\Rightarrow D = \begin{vmatrix} 1 & 2 \\ 3 & 6 \end{vmatrix}$  $\Rightarrow D = -6 - 6$ 

 $\Rightarrow D = 0$ 

# Again, $D_1$ by replacing $1^{st}$ column by B

# Here

 $B = \begin{vmatrix} 5\\15 \end{vmatrix}$   $\Rightarrow D_1 = \begin{vmatrix} 5 & 2\\15 & 6 \end{vmatrix}$   $\Rightarrow D_1 = 30 - 30$   $\Rightarrow D_1 = 0$ And, D<sub>2</sub> by replacing 2<sup>nd</sup> column by B Here

$$B = \begin{vmatrix} 5\\15 \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 1 & 5\\3 & 15 \end{vmatrix}$$
$$\Rightarrow D_2 = 15 - 15$$
$$\Rightarrow D_2 = 0$$

So, here we can see that

 $\mathsf{D}=\mathsf{D}_1=\mathsf{D}_2=\mathsf{0}$ 

Thus,

The system is consistent with infinitely many solutions.

Let

y = k

then,

 $\Rightarrow x + 2y = 5$ 

By changing value of k you may get infinite solutions

# 28. Question

Show that each of the following systems of linear equations has infinite number of solutions and solve:

x + y - z = 0 x - 2y + z = 0 3x + 6y - 5z = 0**Answer** 

Given: - Three equation

x + y - z = 0

x - 2y + z = 0

3x + 6y - 5z = 0

Tip: - We know that

For a system of 3 simultaneous linear equation with 3 unknowns

(i) If  $D \neq 0$ , then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}$$
,  $y = \frac{D_2}{D}$  and  $z = \frac{D_3}{D}$ 

(ii) If D = 0 and  $D_1 = D_2 = D_3 = 0$ , then the given system of equation may or may not be consistent. However if consistent, then it has infinitely many solution.

(iii) If D = 0 and at least one of the determinants  $D_1$ ,  $D_2$  and  $D_3$  is non – zero, then the system is inconsistent.

Now,

We have,

x + y - z = 0

x - 2y + z = 0

3x + 6y - 5z = 0

Lets find D

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 1 & 1 & -1 \\ 1 & -2 & 1 \\ 3 & 6 & -5 \end{vmatrix}$$

Expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D} = \mathbb{1}[\mathbb{10} - (6)\mathbb{1}] - (\mathbb{1})[(-5)\mathbb{1} - (1)\mathbb{3}] + (-1)[6 - (-2)\mathbb{3}]$ 

$$\Rightarrow D = 1[4] - 1[-8] - [12]$$

Again,  $D_1$  by replacing  $1^{st}$  column by B

Here

$$B = \begin{vmatrix} 0 \\ 0 \\ 0 \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} 0 & 1 & -1 \\ 0 & -2 & 1 \\ 0 & 6 & -5 \end{vmatrix}$$

As one column is zero its determinant is zero

 $\Rightarrow D_1 = 0$ 

Also,  $D_2$  by replacing 2<sup>nd</sup> column by B

Here

$$\mathbf{B} = \begin{bmatrix} \mathbf{0} \\ \mathbf{0} \\ \mathbf{0} \end{bmatrix}$$

 $\Rightarrow \mathbf{D}_2 \ = \ \begin{vmatrix} 1 & 0 & -1 \\ 1 & 0 & 1 \\ 3 & 0 & -5 \end{vmatrix}$ 

As one column is zero its determinant is zero

 $\Rightarrow D_2 = 0$ 

```
Again, D_3 by replacing 3^{rd} column by B
```

Here

$$B = \begin{vmatrix} 0 \\ 0 \\ 0 \end{vmatrix}$$
$$\Rightarrow D_3 = \begin{vmatrix} 1 & 1 & 0 \\ 1 & -2 & 0 \\ 3 & 6 & 0 \end{vmatrix}$$

As one column is zero its determinant is zero

$$\Rightarrow D_3 = 0$$

So, here we can see that

 $D = D_1 = D_2 = D_3 = 0$ 

Thus,

Either the system is consistent with infinitely many solutions or it is inconsistent.

Now, by 1<sup>st</sup> two equations, written as

x + y = zx - 2y = -z

Now by applying Cramer's rule to solve them,

New D and  $D_1$ ,  $D_2$ 

 $\Rightarrow \mathbf{D} = \begin{vmatrix} 1 & 1 \\ 1 & -2 \end{vmatrix}$  $\Rightarrow \mathbf{D} = -2 - 1$  $\Rightarrow \mathbf{D} = -3$ 

Again,  $D_1$  by replacing 1<sup>st</sup> column with

$$B = \begin{vmatrix} z \\ -z \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} z & 1 \\ -z & -2 \end{vmatrix}$$
$$\Rightarrow D_1 = -2z - 1(-z)$$
$$\Rightarrow D_1 = -z$$

Again,  $D_2$  by replacing  $2^{nd}$  column with

$$B = \begin{vmatrix} z \\ -z \end{vmatrix}$$
  

$$\Rightarrow D_2 = \begin{vmatrix} 1 & z \\ 1 & -z \end{vmatrix}$$
  

$$\Rightarrow D_2 = -z - z$$
  

$$\Rightarrow D_2 = -2z$$
  
Hence, using Cramer's rule

 $\Rightarrow x = \frac{D_1}{D}$  $\Rightarrow x = \frac{-z}{-3}$ Let, z = k

Then  $x = \frac{k}{3}$ 

again,

$$\Rightarrow y = \frac{D_2}{D}$$
$$\Rightarrow y = \frac{-2z}{-3}$$
$$\Rightarrow y = \frac{2k}{3}$$

And z = k

By changing value of k you may get infinite solutions

# 29. Question

Show that each of the following systems of linear equations has infinite number of solutions and solve:

2x + y - 2z = 4x - 2y + z = -25x - 5y + z = -2

#### Answer

Given: - Three equation

2x + y - 2z = 4

x - 2y + z = -2

5x - 5y + z = -2

Tip: - We know that

For a system of 3 simultaneous linear equation with 3 unknowns

(i) If D  $\neq$  0, then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}$$
,  $y = \frac{D_2}{D}$  and  $z = \frac{D_3}{D}$ 

(ii) If D = 0 and  $D_1 = D_2 = D_3 = 0$ , then the given system of equation may or may not be consistent. However if consistent, then it has infinitely many solution.

(iii) If D = 0 and at least one of the determinants  $D_1$ ,  $D_2$  and  $D_3$  is non – zero, then the system is inconsistent.

**CLICK HERE** 

≫

R www.studentbro.in

Now,

We have,

2x + y - 2z = 4

x - 2y + z = -2

5x - 5y + z = -2

Lets find D

 $\Rightarrow D = \begin{vmatrix} 2 & 1 & -2 \\ 1 & -2 & 1 \\ 5 & -5 & 1 \end{vmatrix}$ 

Expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D} = 2[-2 - (-5)(1)] - (1)[(1)1 - 5(1)] + (-2)[-5 - 5(-2)]$ 

 $\Rightarrow \mathsf{D} = 2[3] - 1[-4] - 2[5]$ 

Again,  $D_1$  by replacing  $1^{st}$  column by B

Here

$$B = \begin{vmatrix} 4 \\ -2 \\ -2 \\ -2 \end{vmatrix}$$
  

$$\Rightarrow D_1 = \begin{vmatrix} 4 & 1 & -2 \\ -2 & -2 & 1 \\ -2 & -5 & 1 \end{vmatrix}$$
  

$$\Rightarrow D_1 = 4[-2 - (-5)(1)] - (1)[(-2)1 - (-2)(1)] + (-2)[(-2)(-5) - (-2)(-2)]$$
  

$$\Rightarrow D_1 = 4[-2 + 5] - [-2 + 2] - 2[6]$$
  

$$\Rightarrow D_1 = 12 + 0 - 12$$
  

$$\Rightarrow D_1 = 0$$

Also,  $D_2$  by replacing  $2^{nd}$  column by B

Here

$$B = \begin{vmatrix} 4 \\ -2 \\ -2 \\ -2 \end{vmatrix}$$
  

$$\Rightarrow D_2 = \begin{vmatrix} 2 & 4 & -2 \\ 1 & -2 & 1 \\ 5 & -2 & 1 \end{vmatrix}$$
  

$$\Rightarrow D_2 = 2[-2 - (-2)(1)] - (4)[(1)1 - (5)] + (-2)[-2 - 5(-2)]$$
  

$$\Rightarrow D_2 = 2[-2 + 2] - 4[-4] + (-2)[8]$$
  

$$\Rightarrow D_2 = 0 + 16 - 16$$
  

$$\Rightarrow D_2 = 0$$

Again,  $D_3$  by replacing  $3^{rd}$  column by B

Here

$$\begin{split} B &= \begin{vmatrix} 4\\ -2\\ -2\\ -2 \end{vmatrix} \\ \Rightarrow D_3 &= \begin{vmatrix} 2 & 1 & 4\\ 1 & -2 & -2\\ 5 & -5 & -2 \end{vmatrix} \\ \Rightarrow D_3 &= 2[4 - (-2)(-5)] - (1)[(-2)1 - 5(-2)] + 4[1(-5) - 5(-2)] \\ \Rightarrow D_3 &= 2[-6] - [8] + 4[-5 + 10] \\ \Rightarrow D_3 &= -12 - 8 + 20 \\ \Rightarrow D_3 &= 0 \\ \end{cases}$$
  
So, here we can see that  
$$D &= D_1 = D_2 = D_3 = 0$$
  
Thus,

Either the system is consistent with infinitely many solutions or it is inconsistent.

Now, by 1<sup>st</sup> two equations, written as

x - 2y = -2 - z

5x - 5y = -2 - z

Now by applying Cramer's rule to solve them,

New D and D<sub>1</sub>, D<sub>2</sub>

$$\Rightarrow D = \begin{vmatrix} 1 & -2 \\ 5 & -5 \end{vmatrix}$$
$$\Rightarrow D = -5 + 10$$
$$\Rightarrow D = 5$$

Again,  $D_1$  by replacing  $1^{st}$  column with

$$B = \begin{vmatrix} -2 & -z \\ -2 & -z \end{vmatrix}$$
  

$$\Rightarrow D_{1} = \begin{vmatrix} -2 & -z & -2 \\ -2 & -z & -5 \end{vmatrix}$$
  

$$\Rightarrow D_{1} = 10 + 5z - (-2)(-2 - z)$$
  

$$\Rightarrow D_{1} = 6 + 3z$$

Again,  $D_2$  by replacing 2<sup>nd</sup> column with

$$B = \begin{vmatrix} -2 & -z \\ -2 & -z \end{vmatrix}$$
  

$$\Rightarrow D_2 = \begin{vmatrix} 1 & -2 & -z \\ 5 & -2 & -z \end{vmatrix}$$
  

$$\Rightarrow D_2 = -2 - z - 5 (-2 - z)$$
  

$$\Rightarrow D_2 = 8 + 4z$$
  
Hence, using Cramer's rule  

$$\Rightarrow x = \frac{D_1}{D}$$
  

$$\Rightarrow x = \frac{6 + 3z}{5}$$
  
again,  

$$\Rightarrow y = \frac{D_2}{D}$$
  

$$\Rightarrow y = \frac{8 + 4z}{5}$$
  
Let,  $z = k$   
Then  

$$x = \frac{6 + 3k}{5}$$
  

$$y = \frac{8 + 4k}{5}$$
  
And  $z = k$   
By changing value of k you may get infinite solutions

#### 30. Question

Show that each of the following systems of linear equations has infinite number of solutions and solve:

x - y + 3z = 6

x + 3y - 3z = -4

5x + 3y + 3z = 10

#### Answer

Given: - Three equation

x - y + 3z = 6

x + 3y - 3z = -4

5x + 3y + 3z = 10

Tip: - We know that

For a system of 3 simultaneous linear equation with 3 unknowns

(iv) If  $D \neq 0$ , then the given system of equations is consistent and has a unique solution given by

$$x = \frac{D_1}{D}$$
,  $y = \frac{D_2}{D}$  and  $z = \frac{D_3}{D}$ 

(v) If D = 0 and  $D_1 = D_2 = D_3 = 0$ , then the given system of equation may or may not be consistent. However if consistent, then it has infinitely many solution.

(vi) If D = 0 and at least one of the determinants  $D_1$ ,  $D_2$  and  $D_3$  is non – zero, then the system is inconsistent.

Now,

We have,

x - y + 3z = 6

x + 3y - 3z = -4

5x + 3y + 3z = 10

Lets find D

 $\Rightarrow D = \begin{vmatrix} 1 & -1 & 3 \\ 1 & 3 & -3 \\ 5 & 3 & 3 \end{vmatrix}$ 

Expanding along 1<sup>st</sup> row

 $\Rightarrow \mathsf{D} = \mathbb{1}[9 - (-3)(3)] - (-1)[(3)\mathbb{1} - 5(-3)] + 3[3 - 5(3)]$ 

 $\Rightarrow D = 1[18] + 1[18] + 3[12]$ 

$$\Rightarrow D = 0$$

Again, D<sub>1</sub> by replacing 1<sup>st</sup> column by B

```
Here
```

$$B = \begin{vmatrix} 6 \\ -4 \\ 10 \end{vmatrix}$$
$$\Rightarrow D_1 = \begin{vmatrix} 6 & -1 & 3 \\ -4 & 3 & -3 \\ 10 & 3 & 3 \end{vmatrix}$$

 $\Rightarrow \mathsf{D}_1 = 6[9 - (-3)(3)] - (-1)[(-4)3 - 10(-3)] + 3[-12 - 30]$ 

Get More Learning Materials Here : 🗾

 $\Rightarrow D_{1} = 6[9 + 9] + [-12 + 30] + 3[-42]$  $\Rightarrow D_{1} = 6[18] + 18 - 3[42]$ 

$$\Rightarrow D_1 = 0$$

Also,  $D_2$  by replacing  $2^{nd}$  column by B

Here

 $B = \begin{vmatrix} 6 \\ -4 \\ 10 \end{vmatrix}$   $\Rightarrow D_2 = \begin{vmatrix} 1 & 6 & 3 \\ 1 & -4 & -3 \\ 5 & 10 & 3 \end{vmatrix}$   $\Rightarrow D_2 = 1[-12 - (-3)10] - 6[3 - 5(-3)] + 3[10 - 5(-4)]$   $\Rightarrow D_2 = [-12 + 30] - 6[3 + 15] + 3[10 + 20]$   $\Rightarrow D_2 = 18 - 6[18] + 3[30]$  $\Rightarrow D_2 = 0$ 

Again,  $D_3$  by replacing  $3^{rd}$  column by B

Here

 $B = \begin{vmatrix} 6 \\ -4 \\ 10 \end{vmatrix}$   $\Rightarrow D_3 = \begin{vmatrix} 1 & -1 & 6 \\ 1 & 3 & -4 \\ 5 & 3 & 10 \end{vmatrix}$   $\Rightarrow D_3 = 1[30 - (-4)(3)] - (-1)[(10 - 5(-4)] + 6[3 - 15]]$   $\Rightarrow D_3 = 1[30 + 12] + 1[10 + 20] + 6[ - 12]$   $\Rightarrow D_3 = 42 + 30 - 72$   $\Rightarrow D_3 = 0$ So, here we can see that

 $D = D_1 = D_2 = D_3 = 0$ 

Thus,

Either the system is consistent with infinitely many solutions or it is inconsistent.

Now, by 1<sup>st</sup> two equations, written as

x - y = 6 - 3z

x + 3y = -4 + 3z

Now by applying Cramer's rule to solve them,

New D and D<sub>1</sub>, D<sub>2</sub>

 $\Rightarrow D = \begin{vmatrix} 1 & -1 \\ 1 & 3 \end{vmatrix}$  $\Rightarrow D = 3 + 1$  $\Rightarrow D = 4$ 

Again,  $\mathsf{D}_1$  by replacing  $\mathbf{1}^{st}$  column with

$$B = \begin{vmatrix} 6 - 3z \\ -4 + 3z \end{vmatrix}$$
  

$$\Rightarrow D_{1} = \begin{vmatrix} 6 - 3z & -1 \\ -4 + 3z & 3 \end{vmatrix}$$
  

$$\Rightarrow D_{1} = 18 - 9z - (-1)(-4 + 3z)$$
  

$$\Rightarrow D_{1} = 14 - 5z$$

Again,  $D_2$  by replacing  $2^{nd}$  column with

$$B = \begin{vmatrix} 6 - 3z \\ -4 + 3z \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 1 & 6 - 3z \\ 1 & -4 + 3z \end{vmatrix}$$
$$\Rightarrow D_2 = -4 + 3z - (6 - 3z)$$
$$\Rightarrow D_2 = -10 + 6z$$

Hence, using Cramer's rule

$$\Rightarrow \mathbf{X} = \frac{\mathbf{D}_1}{\mathbf{D}}$$
$$\Rightarrow \mathbf{X} = \frac{14-6\mathbf{z}}{4}$$
$$\Rightarrow \mathbf{X} = \frac{7-3\mathbf{z}}{2}$$

again,

$$\Rightarrow y = \frac{D_2}{D}$$
$$\Rightarrow y = \frac{-10 + 6z}{4}$$
$$\Rightarrow y = \frac{-5 + 3z}{2}$$

Let, z = k

Then

$$x = \frac{7 - 3k}{2}$$
$$y = \frac{-5 + 3k}{2}$$

And z = k

By changing value of k you may get infinite solutions

# 31. Question

A salesman has the following record of sales during three months for three items A,B and C which have different rates of commission.

Month	Sales of Units			Total commission drawn (in ₹)
	А	В	С	
Jan	90	100	20	800
Feb	130	50	40	900
March	60	100	30	850

Find out the rates of commission on items A,B and C by using determinant method.

#### Answer

Given: - Record of sales during three months

Let, rates of commissions on items A,B and C be x, y and z respectively.

Now, we can arrange this model in linear equation system

Thus, we have

90x + 100y + 20z = 800

130x + 50y + 40z = 900

60x + 100y + 30z = 850

Here

 $\Rightarrow D = \begin{vmatrix} 90 & 100 & 20 \\ 130 & 50 & 40 \\ 60 & 100 & 30 \end{vmatrix}$ 

Applying,  $r_1 \rightarrow r_1 - 2r_2, r_3 \rightarrow \ r_3 - 2r_2$ 

 $\Rightarrow \mathbf{D} = \begin{vmatrix} -170 & 0 & -60 \\ 130 & 50 & 40 \\ -200 & 0 & -50 \end{vmatrix}$ 

Solving determinant, expanding along 2<sup>nd</sup> column

 $\Rightarrow D = 50[(-50)(-170) - (-200)(-60)]$  $\Rightarrow D = 50[8500 - 12000]$ 

⇒ D = - 175000

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

 $\begin{array}{l} B \ = \ \begin{vmatrix} 800 \\ 900 \\ 850 \end{vmatrix} \\ \Rightarrow \ D_1 \ = \ \begin{vmatrix} 800 & 100 & 20 \\ 900 & 50 & 40 \\ 850 & 100 & 30 \end{vmatrix}$ 

Applying,  $r_1 \rightarrow r_1 - 2r_2$ ,  $r_3 \rightarrow r_3 - 2r_2$ 

	-1000	0	-60
$\Rightarrow D_1 =$	900	50	40 -500
	-950	0	-500l

Solving determinant, expanding along 2<sup>nd</sup> column

 $\Rightarrow \mathsf{D}_1 = \mathsf{50}[(-1000)(-500) - (-950)(-60)]$ 

 $\Rightarrow D_1 = 50[50000 - 57000]$ 

 $\Rightarrow \mathsf{D}_1 = -350000$ 

Again, Solve D<sub>2</sub> formed by replacing 2<sup>nd</sup> column by B matrices

Here

 $B = \begin{vmatrix} 800 \\ 900 \\ 850 \end{vmatrix}$ 

$$\Rightarrow D_2 = \begin{vmatrix} 90 & 800 & 20 \\ 130 & 900 & 40 \\ 60 & 850 & 30 \end{vmatrix}$$

Applying,  $r_2 \rightarrow r_2 - 2r_1$ 

$$\Rightarrow D_2 = \begin{vmatrix} 90 & 800 & 20 \\ -50 & -700 & 0 \\ -75 & -350 & 0 \end{vmatrix}$$

Solving determinant, expanding along  $1^{st}$  Row

⇒ D<sub>2</sub> = 20[17500 - 52500]

⇒ D<sub>2</sub> = - 700000

And, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

Here

 $B = \begin{vmatrix} 800 \\ 900 \\ 850 \end{vmatrix}$  $\Rightarrow D_3 = \begin{vmatrix} 90 & 100 & 800 \\ 130 & 50 & 900 \\ 60 & 100 & 850 \end{vmatrix}$ 

Applying,  $r_1 \rightarrow r_1 - 2r_2, r_3 \rightarrow \ r_3 - 2r_2$ 

 $\Rightarrow D_3 = \begin{vmatrix} -170 & 0 & -1000 \\ 130 & 50 & 900 \\ -200 & 0 & -950 \end{vmatrix}$ 

Solving determinant, expanding along 1<sup>st</sup> Row

⇒ D<sub>3</sub> = 50[161500 - 200000]

⇒ D<sub>3</sub> = - 1925000

Thus by Cramer's Rule, we have

$$\Rightarrow x = \frac{D_1}{D}$$

$$\Rightarrow x = \frac{-350000}{-175000}$$

$$\Rightarrow x = 2$$
again,
$$\Rightarrow y = \frac{D_2}{D}$$

$$\Rightarrow y = \frac{-700000}{-175000}$$

$$\Rightarrow y = 4$$
and,
$$\Rightarrow z = \frac{D_3}{D}$$

 $\Rightarrow z = \frac{-1925000}{-175000}$

CLICK HERE

#### z = 11

Thus rates of commission of items A, B and C are 2%, 4% and 11% respectively.

#### 32. Question

An automobile company uses three types of steel  $S_1$ ,  $S_2$  and  $S_3$  for producing three types of cars  $C_1$ ,  $C_2$  and  $C_3$ . Steel requirements (in tons) for each type of cars are given below:

cars	Steel			
		C1	C <sub>2</sub>	C <sub>3</sub>
S <sub>1</sub>		2	3	4
S <sub>2</sub>		1	1	2
S <sub>3</sub>		3	2	1

Using Cramer's rule, find the number of cars of each type which can be produced using 29, 13 and 16 tonnes of steel of three types respectively.

#### Answer

Given: - Steel requirement for each car is given

Let, Number of cars produced by steel type  $C_1$ ,  $C_2$  and  $C_3$  be x, y and z respectively.

Now, we can arrange this model in linear equation system

Thus, we have

2x + 3y + 4z = 29

x + y + 2z = 13

3x + 2y + z = 16

Here

$$\Rightarrow \mathbf{D} = \begin{vmatrix} 2 & 3 & 4 \\ 1 & 1 & 2 \\ 3 & 2 & 1 \end{vmatrix}$$

Applying, 
$$r_1 \rightarrow r_1 - 4r_3$$
,  $r_2 \rightarrow r_2 - 2r_3$ 

 $\Rightarrow \mathbf{D} = \begin{vmatrix} -10 & -5 & 0 \\ -5 & -3 & 0 \\ 3 & 2 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 3<sup>rd</sup> column

 $\Rightarrow D = 1[30 - 25]$  $\Rightarrow D = 5$  $\Rightarrow D = 5$ 

Again, Solve  $D_1$  formed by replacing  $1^{st}$  column by B matrices

Here

 $B = \begin{vmatrix} 29 \\ 13 \\ 16 \end{vmatrix}$  $\Rightarrow D_1 = \begin{vmatrix} 29 & 3 & 4 \\ 13 & 1 & 2 \\ 16 & 2 & 1 \end{vmatrix}$ 

Applying,  $r_1 \rightarrow r_1 - 4r_3, r_2 \rightarrow \ r_2 - 2r_3$ 

$$\Rightarrow D_1 = \begin{vmatrix} -35 & -5 & 0 \\ -19 & -3 & 0 \\ 16 & 2 & 1 \end{vmatrix}$$

Solving determinant, expanding along 3<sup>rd</sup> column

$$\Rightarrow D_1 = 1[(-35)(-3) - (-5)(-19)]$$
$$\Rightarrow D_1 = 1[105 - 95]$$
$$\Rightarrow D_1 = 10$$

Again, Solve  $D_2$  formed by replacing  $2^{nd}$  column by B matrices

Here

$$B = \begin{vmatrix} 29 \\ 13 \\ 16 \end{vmatrix}$$
$$\Rightarrow D_2 = \begin{vmatrix} 2 & 29 & 4 \\ 1 & 13 & 2 \\ 3 & 16 & 1 \end{vmatrix}$$

Applying,  $r_1 \rightarrow r_1 - 4r_3, r_2 \rightarrow \ r_2 - 2r_3$ 

 $\Rightarrow D_2 = \begin{vmatrix} -10 & -35 & 0 \\ -5 & -19 & 0 \\ 3 & 16 & 1 \end{vmatrix}$ 

Solving determinant, expanding along 3<sup>rd</sup> column

 $\Rightarrow D_2 = 1[190 - 175]$ 

 $\Rightarrow D_2 = 15$ 

And, Solve  $D_3$  formed by replacing  $3^{rd}$  column by B matrices

Here

 $B = \begin{vmatrix} 29 \\ 13 \\ 16 \end{vmatrix}$  $\Rightarrow D_3 = \begin{vmatrix} 2 & 3 & 29 \\ 1 & 1 & 13 \\ 3 & 2 & 16 \end{vmatrix}$ 

Applying,  $r_1 \rightarrow r_1 - 2r_2, r_3 \rightarrow \ r_3 - 3r_2$ 

$$\Rightarrow D_3 = \begin{vmatrix} 0 & 1 & 3 \\ 1 & 1 & 13 \\ 0 & -1 & -23 \end{vmatrix}$$

Solving determinant, expanding along 1<sup>st</sup> column

$$\Rightarrow D_3 = -1[-23 - (-1)3]$$

 $\Rightarrow D_3 = 20$ 

Thus by Cramer's Rule, we have

$$\Rightarrow x = \frac{D_1}{D}$$
$$\Rightarrow x = \frac{10}{5}$$
$$\Rightarrow x = 2$$

again,

 $\Rightarrow y = \frac{D_2}{D}$  $\Rightarrow y = \frac{15}{5}$  $\Rightarrow y = 3$ and, $\Rightarrow z = \frac{D_3}{D}$  $\Rightarrow z = \frac{20}{5}$ 

 $\Rightarrow z = 4$ 

Thus Number of cars produced by type  $C_1$ ,  $C_2$  and  $C_3$  are 2, 3 and 4 respectively.

# Exercise 6.5

#### 1. Question

Solve each of the following systems of homogeneous linear equations:

x + y - 2z = 0

2x + y - 3z = 0

5x + 4y - 9z = 0

# Answer

Given Equations:

x + y - 2z = 0

2x + y - 3z = 0

5x + 4y - 9z = 0

Any system of equation can be written in matrix form as AX = B

Now finding the Determinant of these set of equations,

```
D = \begin{vmatrix} 1 & 1 & -2 \\ 2 & 1 & -3 \\ 5 & 4 & -9 \end{vmatrix}
|A| = 1 \begin{vmatrix} 1 & -3 \\ 4 & -9 \end{vmatrix} - 1 \begin{vmatrix} 2 & -3 \\ 5 & -9 \end{vmatrix} - 2 \begin{vmatrix} 2 & 1 \\ 5 & 4 \end{vmatrix}
= 1(1 \times (-9) - 4 \times (-3)) - 1(2 \times (-9) - 5 \times (-3)) - 2(4 \times 2 - 5 \times 1))
= 1(-9 + 12) - 1(-18 + 15) - 2(8 - 5)
= 1 \times 3 - 1 \times (-3) - 2 \times 3
= 3 + 3 - 6
= 0
Since D = 0, so the system of equation has infinite solution.
Now let z = k
\Rightarrow x + y = 2k
And 2x + y = 3k
Now using the cramer's rule
```

CLICK HERE

>>>

🕀 www.studentbro.in

$$x = \frac{D_1}{D}$$
$$x = \frac{\begin{vmatrix} 2k & 1 \\ 3k & 1 \end{vmatrix}}{\begin{vmatrix} 1 & 1 \\ 2 & 1 \end{vmatrix}}$$
$$x = \frac{-k}{-1}$$
$$x = k$$

similarly,

$$y = \frac{D_2}{D}$$
$$y = \frac{\begin{vmatrix} 1 & 2k \\ 2 & 3k \end{vmatrix}}{\begin{vmatrix} 1 & 1 \\ 2 & 1 \end{vmatrix}}$$
$$y = \frac{-k}{-1}$$

$$y = k$$

Hence, x = y = z = k.

#### 2. Question

Solve each of the following systems of homogeneous linear equations:

2x + 3y + 4z = 0

X + y + z = 0

2x + 5y - 2z = 0

# Answer

Given Equations:

2x + 3y + 4z = 0X + y + z = 02x + 5y - 2z = 0

Any system of equation can be written in matrix form as AX = B

Now finding the Determinant of these set of equations,

$$D = \begin{vmatrix} 2 & 3 & 4 \\ 1 & 1 & 1 \\ 2 & 5 & -2 \end{vmatrix}$$
$$|A| = 2 \begin{vmatrix} 1 & 1 \\ 5 & -2 \end{vmatrix} - 3 \begin{vmatrix} 1 & 1 \\ 2 & -2 \end{vmatrix} + 4 \begin{vmatrix} 1 & 1 \\ 2 & 5 \end{vmatrix}$$
$$= 2(1 \times (-2) - 1 \times 5) - 3(1 \times (-2) - 2 \times 1) + 4(1 \times 5 - 2 \times 1)$$
$$= 2(-2 - 5) - 3(-2 - 2) + 4(5 - 2)$$
$$= 1 \times (-7) - 3 \times (-4) + 4 \times 3$$
$$= -7 + 12 + 12$$
$$= 17$$

Since  $D \neq 0$ , so the system of equation has infinite solution.

Therefore the system of equation has only solution as x = y = z = 0.

#### 3. Question

Solve each of the following systems of homogeneous linear equations:

3x + y + z = 0

x - 4y3z = 0

2x + 5y - 2z = 0

#### Answer

Given Equations:

3x + y + z = 0x - 4y + 3z = 02x + 5y - 2z = 0

Any system of equation can be written in matrix form as AX = B

Now finding the Determinant of these set of equations,

$$D = \begin{vmatrix} 3 & 1 & 1 \\ 1 & -4 & 3 \\ 2 & 5 & -2 \end{vmatrix}$$
$$|D| = 3 \begin{vmatrix} -4 & 3 \\ 5 & -2 \end{vmatrix} - 1 \begin{vmatrix} 1 & 3 \\ 2 & -2 \end{vmatrix} + 1 \begin{vmatrix} 1 & -4 \\ 2 & 5 \end{vmatrix}$$
$$= 3(-4 \times (-2) - 3 \times 5) - 1(1 \times (-2) - 3 \times 2) + 1(1 \times 5 - 2 \times (-4))$$
$$= 3(8 - 15) - 1(-2 - 6) + 1(5 + 8)$$
$$= 3 \times (-7) - 1 \times (-8) + 1 \times 13$$
$$= -21 + 8 + 13$$
$$= 0$$

Since D = 0, so the system of equation has infinite solution.

Now let z = k

 $\Rightarrow$  3x + y = - k

And x - 4y = -3k

Now using the cramer's rule

$$x = \frac{D_1}{D}$$
$$x = \frac{\begin{vmatrix} -k & 1 \\ -3k & -4 \end{vmatrix}}{\begin{vmatrix} 3 & 1 \\ 1 & -4 \end{vmatrix}}$$
$$x = \frac{7k}{-13}$$

similarly,

$$y = \frac{D_2}{D}$$

$$y = \frac{\begin{vmatrix} 3 & -k \\ 1 & -3k \end{vmatrix}}{\begin{vmatrix} 3 & 1 \\ 1 & -4 \end{vmatrix}}$$
$$y = \frac{-8k}{-13}$$

Hence  $x~=~\frac{7k}{-13}$  ;  $y~=~\frac{8k}{13}$  and z~=~k

#### 4. Question

Find the real values of  $\lambda$  for which the followings system of linear equations has non – trivial solutions. Also, find the non – trivial solutions

 $2\lambda x - 2y + 3z = 0$ 

 $X + \lambda y + 2z = 0$ 

 $2x + \lambda z = 0$ 

#### Answer

Given Equations:

 $2\lambda x - 2y + 3z = 0$ 

 $x + \lambda y + 2z = 0$ 

$$2x + \lambda z = 0$$

For trivial solution D = 0

 $D = \begin{vmatrix} 2\lambda & -2 & 3 \\ 1 & \lambda & 2 \\ 2 & 0 & \lambda \end{vmatrix}$  $|\mathbf{D}| = 2\lambda \begin{vmatrix} \lambda & 2 \\ 0 & \lambda \end{vmatrix} - 2 \begin{vmatrix} 1 & 2 \\ 2 & \lambda \end{vmatrix} + 3 \begin{vmatrix} 1 & \lambda \\ 2 & 0 \end{vmatrix}$  $= 2\lambda (\lambda \times \lambda - 0 \times 2) + 2(1 \times \lambda - 2 \times 2) + 3(1 \times 0 - 2 \times \lambda)$  $= 2\lambda (\lambda^2 - 0) + 2(\lambda - 4) + 3(0 - 2\lambda)$  $= 2\lambda^3 + 2\lambda - 8 - 6\lambda$  $= 2\lambda^3 + 4\lambda - 8$ Now D = 0 $2\lambda^3 - 4\lambda - 8 = 0$  $2\lambda^3 - 4\lambda = 8$  $\lambda(\lambda^2 - 2) = 4$ Hence  $\lambda = 2$ Now let z = k $\Rightarrow$  4x - 2y = - 3k And x + 2y = -2kNow using the cramer's rule n

$$x = \frac{D_1}{D}$$

Get More Learning Materials Here :

$$x = \frac{\begin{vmatrix} -3k & -2 \\ -2k & 2 \end{vmatrix}}{\begin{vmatrix} 4 & -2 \\ 1 & 2 \end{vmatrix}}$$
$$x = \frac{-10k}{10}$$

x = -ksimilarly,

 $y = \frac{D_2}{D}$  $y = \frac{\begin{vmatrix} 4 & -3k \\ 1 & -2k \end{vmatrix}}{\begin{vmatrix} 1 & 1 \\ 2 & 1 \end{vmatrix}}$  $y = \frac{-5k}{10}$  $y = -\frac{k}{2}$ 

Hence x = -k;  $y = -\frac{k}{2}$  and z = k

# 5. Question

If a,b,c are non - zero real numbers and if the system of equations

(a - 1) x = y + z(b - 1) y = z + x

(c - 1) z = x + y

Has a non - trivial solution, then prove that ab + bc + ca = abc.

# Answer

Given Equations:

(a - 1) x = y + z

(b - 1) y = z + x

(c - 1) z = x + y

Rearranging these equations

(a - 1)x - y - z = 0

-x + (b - 1)y - z = 0

$$-x - y + (c - 1)z = 0$$

For trivial solution D = 0

$$D = \begin{vmatrix} (a-1) & -1 & -1 \\ -1 & (b-1) & -1 \\ -1 & -1 & (c-1) \end{vmatrix}$$
$$|D| = (a-1) \begin{vmatrix} (b-1) & -1 \\ -1 & (c-1) \end{vmatrix} + 1 \begin{vmatrix} -1 & -1 \\ -1 & (c-1) \end{vmatrix} - 1 \begin{vmatrix} -1 & (b-1) \\ -1 & (c-1) \end{vmatrix}$$
$$= (a-1)((b-1)(c-1) - (-1)(c-1)) + 1(-1(c-1) - (-1)(c-1)) - 1((-1)(c-1) + (b-1))$$

Get More Learning Materials Here : 💵

= (a - 1)(bc - b - c + 1 - 1) + (1 - c - 1) - 1(1 + b - 1)) = (a - 1)(bc - b - c) - c - b = abc - ab - ac - bc + b + c - b - c = abc - ab - ac - bcNow D = 0  $\Rightarrow abc - ab - ac - bc = 0$   $\Rightarrow abc = ab + bc + ac$ Hence proved.

# MCQ

# 1. Question

Mark the correct alternative in the following:

If A and B are square matrices or order 2, then det (A + B) = 0 is possible only when

- A. det (A) = 0 or det (B) = 0
- B. det (A) + det (B) = 0
- C. det (A) = 0 and det (B) = 0
- D. A + B = 0

#### Answer

We are given that,

Matrices A and B are square matrices.

Order of matrix A = 2

Order of matrix B = 2

Det (A + B) = 0

We need to find the condition at which det (A + B) = 0.

Let,

Matrix  $A = [a_{ij}]$ 

Matrix  $B = [b_{ij}]$ 

Since their orders are same, we can express matrices A and B as

```
A + B = [a_{ij} + b_{ij}]
```

```
\Rightarrow |A + B| = |a_{ij} + b_{ij}| \dots (i)
```

Also, we know that

```
Det (A + B) = 0
```

That is, |A + B| = 0

From (i),

 $|a_{ij} + b_{ij}| = 0$ 

lf

```
\Rightarrow [a_{ij} + b_{ij}] = 0
```

Each corresponding element is 0.

 $\Rightarrow A + B = 0$ 

Thus, det (A + B) = 0 is possible when A + B = 0.

# 2. Question

Mark the correct alternative in the following:

Which of the following is not correct?

A.  $|A| = |A^{T}|$ , where  $A = [a_{ij}]_{3 \times 3}$ 

B.  $|kA| = k^3 |A|$ , where  $A = [a_{ij}]_3 \times 3$ 

C. If A is a skew-symmetric matrix of odd order, then |A| = 0

D.	a + b	c+d	a	c	b	d
	e + f	$\begin{vmatrix} c+d \\ g+h \end{vmatrix} =$	e	g	f	h

# Answer

We are given that,

 $A = [a_{ij}]_{3 \times 3}$ 

That is, order of matrix A = 3

Example:

Let,

 $\mathbf{A} = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{bmatrix}$ 

Take determinant of A.

Determinant of  $3 \times 3$  matrices is found as,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}
\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31})
+ a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})
```

So,

$$\begin{vmatrix} 2 & 1 & 2 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix} = 2. \det \begin{bmatrix} 3 & 2 \\ 2 & 1 \end{bmatrix} - 1. \det \begin{bmatrix} 1 & 2 \\ 3 & 1 \end{bmatrix} + 2. \det \begin{bmatrix} 1 & 3 \\ 3 & 2 \end{bmatrix}$$
$$\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix} = 2(3 \times 1 - 2 \times 2) - 1(1 \times 1 - 2 \times 3) + 2(1 \times 2 - 3 \times 3)$$
$$\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix} = 2(3 - 4) - 1(1 - 6) + 2(2 - 9)$$
$$\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix} = 2(-1) - (-5) + 2(-7)$$

 $\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix} = -2 + 5 - 14$  $\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 1 & 3 & 2 \\ 3 & 2 & 1 \end{vmatrix} = -11$  $\Rightarrow |\mathsf{A}| = -11$ 

The transpose of a matrix is a new matrix whose rows are the columns of the original. So,

 $A^{T} = \begin{bmatrix} 2 & 1 & 3 \\ 1 & 3 & 2 \\ 2 & 2 & 1 \end{bmatrix}$ 

-

Determinant of A<sup>T</sup>:

$$\begin{vmatrix} 2 & 1 & 3 \\ 3 & 3 & 2 \\ 4 & 2 & 1 \end{vmatrix} = 2 \cdot \det \begin{bmatrix} 3 & 2 \\ 2 & 1 \end{bmatrix} - 1 \cdot \det \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} + 3 \cdot \det \begin{bmatrix} 1 & 3 \\ 2 & 2 \end{bmatrix}$$

$$\Rightarrow \begin{vmatrix} 2 & 1 & 3 \\ 3 & 3 & 2 \\ 4 & 2 & 1 \end{vmatrix} = 2(3 \times 1 - 2 \times 2) - (1 \times 1 - 2 \times 2) + 3(1 \times 2 - 3 \times 2)$$

$$\Rightarrow \begin{vmatrix} 2 & 1 & 3 \\ 3 & 3 & 2 \\ 4 & 2 & 1 \end{vmatrix} = 2(3 - 4) - (1 - 4) + 3(2 - 6)$$

$$\Rightarrow \begin{vmatrix} 2 & 1 & 3 \\ 3 & 3 & 2 \\ 4 & 2 & 1 \end{vmatrix} = 2(-1) - (-3) + 3(-4)$$

$$\Rightarrow \begin{vmatrix} 2 & 1 & 3 \\ 3 & 3 & 2 \\ 4 & 2 & 1 \end{vmatrix} = -2 + 3 - 12$$

$$\Rightarrow \begin{vmatrix} 2 & 1 & 3 \\ 3 & 3 & 2 \\ 4 & 2 & 1 \end{vmatrix} = -11$$

So, we can conclude that,

 $|A| = |A^{T}|$ , where  $A = [a_{ij}]_{3 \times 3}$ .

Option (B) is correct.

 $|kA| = k^{3}|A|$ , where A =  $[a_{ij}]_{3\times 3}$ 

Example:

Let k = 2.

And,

 $\mathbf{A} = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 2 & 3 \\ 3 & 2 & 1 \end{bmatrix}$ 

Take Left Hand Side of the equation:

LHS = |kA| $\Rightarrow LHS = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 2 & 3 \\ 3 & 2 & 1 \end{bmatrix}$ 

Multiply 2 by each term of the matrix.

 $\Rightarrow LHS = \begin{vmatrix} 2 \times 2 & 2 \times 3 & 2 \times 4 \\ 2 \times 1 & 2 \times 2 & 2 \times 3 \\ 2 \times 3 & 2 \times 2 & 2 \times 3 \end{vmatrix}$  $\Rightarrow$  LHS =  $\begin{vmatrix} 4 & 6 & 8 \\ 2 & 4 & 6 \\ 6 & 4 & 2 \end{vmatrix}$  $\Rightarrow$  LHS = 4. det  $\begin{bmatrix} 4 & 6 \\ 4 & 2 \end{bmatrix} - 6.$  det  $\begin{bmatrix} 2 & 6 \\ 6 & 2 \end{bmatrix} + 8.$  det  $\begin{bmatrix} 2 & 4 \\ 6 & 4 \end{bmatrix}$  $\Rightarrow LHS = 4(4 \times 2 - 6 \times 4) - 6(2 \times 2 - 6 \times 6) + 8(2 \times 4 - 4 \times 6)$  $\Rightarrow$  LHS = 4(8 - 24) - 6(4 - 36) + 8(8 - 24)  $\Rightarrow$  LHS = 4(-16) - 6(-32) + 8(-16) ⇒ LHS = -64 + 192 - 128  $\Rightarrow$  LHS = 0 Take Right Hand Side of the equation:  $RHS = k^3 |A|$  $\Rightarrow$  RHS = 2<sup>3</sup>  $\begin{vmatrix} 2 & 3 & 4 \\ 1 & 2 & 3 \\ 2 & 2 & 1 \end{vmatrix}$  $\Rightarrow RHS = 8 \begin{vmatrix} 2 & 3 & 4 \\ 1 & 2 & 3 \\ 3 & 2 & 1 \end{vmatrix}$  $\Rightarrow \text{RHS} = 8 \begin{bmatrix} 2. \det \begin{bmatrix} 2 & 3 \\ 2 & 1 \end{bmatrix} - 3. \det \begin{bmatrix} 1 & 3 \\ 3 & 1 \end{bmatrix} + 4. \det \begin{bmatrix} 1 & 2 \\ 3 & 2 \end{bmatrix}$  $\Rightarrow RHS = 8 [2(2 \times 1 - 3 \times 2) - 3(1 \times 1 - 3 \times 3) + 4(1 \times 2 - 2 \times 3)]$  $\Rightarrow$  RHS = 8 [2(2 - 6) - 3(1 - 9) + 4(2 - 6)]  $\Rightarrow$  RHS = 8 [2(-4) - 3(-8) + 4(-4)] ⇒ RHS = 8 [-8 + 24 - 16]  $\Rightarrow$  RHS = 8  $\times$  0  $\Rightarrow$  RHS = 0 Since, LHS = RHS. We can conclude that,  $|kA| = k^3 |A|$ , where A =  $[a_{ii}]_{3\times 3}$ Option (C) is also correct.

If A is a skew-symmetric matrix of odd order, then |A| = 0.

If the transpose of a matrix is equal to the negative of itself, the matrix is said to be skew symmetric. In other words,  $A^{T} = -A$ .

Example,

Let a matrix of odd order  $3 \times 3$  be,

 $A = \begin{bmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{bmatrix}$ 

Take determinant of A.

$$\begin{vmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{vmatrix} = 0. \det \begin{bmatrix} 0 & 7 \\ -7 & 0 \end{bmatrix} - (-6). \det \begin{bmatrix} 6 & 7 \\ -4 & 0 \end{bmatrix} + 4. \det \begin{bmatrix} 6 & 0 \\ -4 & -7 \end{bmatrix}$$
$$\Rightarrow \begin{vmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{vmatrix} = 0 + 6(6 \times 0 - 7 \times -4) + 4(6 \times (-7) - 0 \times -4)$$
$$\Rightarrow \begin{vmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{vmatrix} = 0 + 6(0 + 28) + 4(-42 + 0)$$
$$\Rightarrow \begin{vmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{vmatrix} = 0 + 6(28) + 4(-42)$$
$$\Rightarrow \begin{vmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{vmatrix} = 168 - 168$$
$$\Rightarrow \begin{vmatrix} 0 & -6 & 4 \\ 6 & 0 & 7 \\ -4 & -7 & 0 \end{vmatrix} = 0$$

Thus, we can conclude that

If A is a skew-symmetric matrix of odd order, then |A| = 0.

Option (D) is incorrect.

Let a = 1, b = 3, c = 3, d = -4, e = -2, f = 5, g = 0 and h = 2.

Take Left Hand Side,

```
LHS = \begin{vmatrix} a+b & c+d \\ e+f & g+h \end{vmatrix}

\Rightarrow LHS = \begin{vmatrix} 1+3 & 3-4 \\ -2+5 & 0+2 \end{vmatrix}

\Rightarrow LHS = \begin{vmatrix} 4 & -1 \\ 3 & 2 \end{vmatrix}

\Rightarrow LHS = 4 \times 2 - (-1) \times 3

\Rightarrow LHS = 4 \times 2 - (-1) \times 3

\Rightarrow LHS = 8 + 3

\Rightarrow LHS = 11

Take Right Hand Side,

RHS = \begin{vmatrix} a & c \\ e & g \end{vmatrix} + \begin{vmatrix} b & d \\ f & h \end{vmatrix}

\Rightarrow RHS = \begin{vmatrix} 1 & 3 \\ -2 & 0 \end{vmatrix} + \begin{vmatrix} 3 & -4 \\ 5 & 2 \end{vmatrix}

\Rightarrow RHS = (1 \times 0 - 3 \times (-2)) + (3 \times 2 - (-4) \times 5)

\Rightarrow RHS = (0 + 6) + (6 + 20)

\Rightarrow RHS = 6 + 26

\Rightarrow RHS = 32

Since, LHS \neq RHS. Then, we can conclude that,

\begin{vmatrix} a+b & c+d \\ e+f & g+h \end{vmatrix} \neq \begin{vmatrix} a & c \\ e & g \end{vmatrix} + \begin{vmatrix} b & d \\ f & h \end{vmatrix}
```

3. Question

Mark the correct alternative in the following:

 $\text{If } A = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \text{ and } C_{ij} \text{ is cofactor of } a_{ij} \text{ in } A, \text{ then value of } |A| \text{ is given by }$ 

A.  $a_{11}C_{31} + a_{12}C_{32} + a_{13}C_{33}$ 

B.  $a_{11}C_{11} + a_{12}C_{21} + a_{13}C_{31}$ 

C.  $a_{21}C_{11} + a_{22}C_{12} + a_{23}C_{13}$ 

```
D. a_{11}C_{11} + a_{21}C_{21} + a_{31}C_{31}
```

# Answer

Let us understand what cofactor of an element is.

A cofactor is the number you get when you remove the column and row of a designated element in a matrix, which is just a numerical grid in the form of a rectangle or a square. The cofactor is always preceded by a positive (+) or negative (-) sign, depending whether the element is in a + or - position. It is

```
\begin{bmatrix} + & - & + \\ - & + & - \\ + & - & + \end{bmatrix}
```

Let us recall how to find the cofactor of any element:

If we are given with,

[a<sub>11</sub> a<sub>12</sub> a<sub>13</sub>] a<sub>21</sub> a<sub>22</sub> a<sub>23</sub> a<sub>31</sub> a<sub>32</sub> a<sub>33</sub>]

Cofactor of any element say  $a_{11}$  is found by eliminating first row and first column.

```
Cofactor of a_{11} = \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix}
```

```
\Rightarrow Cofactor of a_{11} = a_{22} \times a_{33} - a_{23} \times a_{32}
```

The sign of cofactor of  $a_{11}$  is (+).

And, cofactor of any element, say  $a_{12}$  is found by eliminating first row and second column.

```
Cofactor of a_{12} = \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}
```

 $\Rightarrow$  Cofactor of  $a_{12} = a_{21} \times a_{33} - a_{23} \times a_{31}$ 

The sign of cofactor of  $a_{12}$  is (-).

We are given that,

 $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$ 

And  $C_{ij}$  is the cofactor of  $a_{ij}$  in A.

Determinant of  $3 \times 3$  matrix is given as,

 $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$ =  $a_{11}$ .det  $\begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix}$  -  $a_{12}$ .det  $\begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{32} \end{bmatrix}$  +  $a_{13}$ .det  $\begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}$ 

CLICK HERE 🌔 ≫

🕀 www.studentbro.in

Or,

```
 \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} 
 = a_{11} \cdot \det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} + a_{21} \cdot \det \begin{bmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{bmatrix} + a_{31} \cdot \det \begin{bmatrix} a_{12} & a_{13} \\ a_{22} & a_{23} \end{bmatrix}
```

Or using the definition of cofactors,

 $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11}C_{11} + a_{21}C_{21} + a_{31}C_{31}$ 

Thus, proved.

# 4. Question

Mark the correct alternative in the following:

Which of the following is not correct in a given determinant of A, where A =  $[a_{ij}]_{3 \times 3}$ .

A. Order of minor is less than order of the det (A)

B. Minor of an element can never be equal to cofactor of the same element

C. Value of a determinant is obtained by multiplying elements of a row or column by corresponding cofactors

D. Order of minors and cofactors of elements of A is same

#### Answer

For option (A),

A minor is the determinant of the square matrix formed by deleting one row and one column from some larger square matrix.

So, the order of minor is always less than the order of determinant.

Thus, option (A) is correct.

For option (B),

A cofactor is the number you get when you remove the column and row of a designated element in a matrix, which is just a numerical grid in the form of a rectangle or a square.

🕀 www.studentbro.in

A minor is the determinant of the square matrix formed by deleting one row and one column from some larger square matrix.

Since, the definition of cofactor and minor is same, then we can conclude that

Minor of an element is always equal to cofactor of the same element.

Thus, option (B) is incorrect.

For option (C),

Determinant of  $3 \times 3$  matrix is given as,

 $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$ =  $a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}$ Or,  $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$ =  $a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} + a_{21}.det \begin{bmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{bmatrix} + a_{31}.det \begin{bmatrix} a_{12} & a_{13} \\ a_{22} & a_{23} \end{bmatrix}$ 

Or using the definition of cofactors,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11}C_{11} + a_{21}C_{21} + a_{31}C_{31}
```

Thus, option (C) is correct.

For option (D),

A cofactor is the number you get when you remove the column and row of a designated element in a matrix, which is just a numerical grid in the form of a rectangle or a square.

A minor is the determinant of the square matrix formed by deleting one row and one column from some larger square matrix.

Since, the definition of cofactor and minor is same, then we can say that,

Minor of an element is always equal to cofactor of the same element.

⇒ The order of the minor and cofactor of A is same. (where A is some matrix)

Thus, option (D) is correct.

#### 5. Question

Mark the correct alternative in the following:

Let  $\begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = ax^4 + bx^3 + cx^2 + dx + e$ . Then, the value of 5a + 4b + 3c + 2d + e is equal to

A. 0

B. -16

C. 16

D. none of these

#### Answer

We are given that,

 $\begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = ax^4 + bx^3 + cx^2 + dx + e$ 

We need to find the value of 5a + 4b + 3c + 2d + e.

Determinant of  $3 \times 3$  matrix is given as,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \cdot \det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12} \cdot \det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13} \cdot \det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31}) + a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31}) \end{vmatrix}So,\begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & y & x & 6 \end{vmatrix} = x \cdot \det \begin{bmatrix} x & 6 \\ x & 6 \end{bmatrix} - 2 \cdot \det \begin{bmatrix} x^2 & 6 \\ x & 6 \end{bmatrix} + x \cdot \det \begin{bmatrix} x^2 & x \\ x & x \end{bmatrix}
```

# 🕀 www.studentbro.in

$$\Rightarrow \begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = x(x \times 6 - 6 \times x) - 2(x^2 \times 6 - 6 \times x) + x(x^2 \times x - x \times x)$$

$$\Rightarrow \begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = x(6x - 6x) - 2(6x^2 - 6x) + x(x^3 - x^2)$$

$$\Rightarrow \begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = x(0) - 12x^2 + 12x + x^4 - x^3$$

$$\Rightarrow \begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = x^4 - x^3 - 12x^2 + 12x$$

Since,

 $\begin{vmatrix} x & 2 & x \\ x^2 & x & 6 \\ x & x & 6 \end{vmatrix} = ax^4 + bx^3 + cx^2 + dx + e$ 

$$\Rightarrow x^4 - x^3 - 12x^2 + 12x = ax^4 + bx^3 + cx^2 + dx + e$$

Comparing the left hand side and right hand side of the equation, we get

a = 1 b = -1 c = -12 d = 12 e = 0 Putting these values in 5a + 4b + 3c + 2d + e, we get 5a + 4b + 3c + 2d + e = 5(1) + 4(-1) + 3(-12) + 2(12) + 0  $\Rightarrow$  5a + 4b + 3c + 2d + e = 5 - 4 - 36 + 24  $\Rightarrow$  5a + 4b + 3c + 2d + e = 25 - 36  $\Rightarrow$  5a + 4b + 3c + 2d + e = -11 Thus, the values of 5a + 4b + 3c + 2d + e is -11.

#### 6. Question

Mark the correct alternative in the following:

 $\begin{array}{c|cccc} a^2 & a & 1 \\ cosnx & cos(n+1)x & cos(n+2)x \\ sin nx & sin(n+1)x & sin(n+2)x \end{array} is independent of$ 

**CLICK HERE** 

>>

🕀 www.studentbro.in

В. а

С. х

D. none of these

## Answer

Let us solve the determinant.

 $\begin{array}{cccc} a^2 & a & 1\\ \cos nx & \cos(n+1)x & \cos(n+2)x\\ \sin nx & \sin(n+1)x & \sin(n+2)x \end{array}$ 

We know that,

Determinant of  $3 \times 3$  matrix is given as,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}
\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31}) + a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})
```

So,

$$\begin{vmatrix} a^{2} & a & 1\\ \cos nx & \cos(n+1)x & \cos(n+2)x\\ \sin nx & \sin(n+1)x & \sin(n+2)x \end{vmatrix}$$
  
=  $a^{2}.det \begin{bmatrix} \cos(n+1)x & \cos(n+2)x\\ \sin(n+1)x & \sin(n+2)x \end{bmatrix}$   
-  $a.det \begin{bmatrix} \cos nx & \cos(n+2)x\\ \sin nx & \sin(n+2)x \end{bmatrix} + det \begin{bmatrix} \cos nx & \cos(n+1)x\\ \sin nx & \sin(n+1)x \end{bmatrix}$ 

$$\Rightarrow \begin{vmatrix} \cos nx & \cos(n+1)x & \cos(n+2)x \\ \sin nx & \sin(n+1)x & \sin(n+2)x \end{vmatrix} \\ = a^2(\cos(n+1)x \times \sin(n+2)x - \cos(n+2)x \times \sin(n+1)x) \\ - a(\cos nx \times \sin(n+2)x - \cos(n+2)x \times \sin nx) \\ + (\cos nx \times \sin(n+1)x - \cos(n+1)x \times \sin nx) \end{vmatrix}$$

By trigonometric identity, we have

 $\sin (\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta$ 

So, we can write

.

$$\Rightarrow \begin{vmatrix} a^2 & a & 1\\ \cos nx & \cos(n+1)x & \cos(n+2)x\\ \sin nx & \sin(n+1)x & \sin(n+2)x \end{vmatrix} \\ = a^2 \sin((n+2)x - (n+1)x) - a \sin((n+2)x - nx) \\ + \sin((n+1)x - nx) \end{vmatrix}$$

$$\Rightarrow \begin{vmatrix} a^2 & a & 1\\ \cos nx & \cos(n+1)x & \cos(n+2)x\\ \sin nx & \sin(n+1)x & \sin(n+2)x\\ &= a^2 \sin(nx+2x-nx-x) - a \sin(nx+2x-nx)\\ &+ \sin(nx+x-nx) \end{vmatrix}$$

 $\Rightarrow \begin{vmatrix} a^2 & a & 1\\ \cos nx & \cos(n+1)x & \cos(n+2)x\\ \sin nx & \sin(n+1)x & \sin(n+2)x \end{vmatrix} = a^2 \sin x - a \sin 2x + \sin x$ 

Note that, the result has 'a' as well as 'x', but doesn't contain 'n'.

**CLICK HERE** 

>>

🕀 www.studentbro.in

Thus, the determinant is independent of n.

7. Question

Mark the correct alternative in the following:

If 
$$\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$$
,  $\Delta_2 = \begin{vmatrix} 1 & bc & a \\ 1 & ca & b \\ 1 & ab & c \end{vmatrix}$ , then

A.  $\Delta_1 + \Delta_2 = 0$ 

$$\mathsf{B}.\ \Delta_1 + 2\Delta_2 = 0$$

$$C. \Delta_1 = \Delta_2$$

D. none of these

#### Answer

We are given that,

 $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix} \text{ and } \Delta_2 = \begin{vmatrix} 1 & bc & a \\ 1 & ca & b \\ 1 & ab & c \end{vmatrix}$ 

Let us find the determinants  $\Delta_1$  and  $\Delta_2$ .

We know that,

Determinant of  $3 \times 3$  matrix is given as,

```
\begin{array}{cccc} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{array}
                                  = a_{11} \det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12} \det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13} \det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}
\begin{array}{cccc} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{array}
                                     = a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31})
                                  +a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})
 So,
\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}
\Rightarrow \Delta_1 = \det \begin{bmatrix} b & c \\ b^2 & c^2 \end{bmatrix} - \det \begin{bmatrix} a & c \\ a^2 & c^2 \end{bmatrix} + \det \begin{bmatrix} a & b \\ a^2 & b^2 \end{bmatrix}
\Rightarrow \Delta_1 = (b \times c^2 - c \times b^2) - (a \times c^2 - c \times a^2) + (a \times b^2 - b \times a^2)
\Rightarrow \Delta_1 = bc^2 - b^2c - ac^2 + a^2c + ab^2 - a^2b ...(i)
Also,
\Rightarrow \Delta_2 = \begin{vmatrix} 1 & bc & a \\ 1 & ca & b \\ 1 & ab & c \end{vmatrix}
\Rightarrow \Delta_2 = \det \begin{bmatrix} ca & b \\ ab & c \end{bmatrix} - bc. \det \begin{bmatrix} 1 & b \\ 1 & c \end{bmatrix} + a. \det \begin{bmatrix} 1 & ca \\ 1 & ab \end{bmatrix}
 \Rightarrow \Delta_2 = (ca \times c - b \times ab) - bc(1 \times c - b \times 1) + a(1 \times ab - ca \times 1)
 \Rightarrow \Delta_2 = ac^2 - ab^2 - bc(c - b) + a(ab - ac)
\Rightarrow \Delta_2 = ac^2 - ab^2 - bc^2 + b^2c + a^2b - a^2c ...(ii)
```

Checking Option (A).

Adding  $\Delta_1$  and  $\Delta_2$  by using values from (i) and (ii),  $\Delta_1 + \Delta_2 = (bc^2 - b^2c - ac^2 + a^2c + ab^2 - a^2b) + (ac^2 - ab^2 - bc^2 + b^2c + a^2b - a^2c)$  $\Rightarrow \Delta_1 + \Delta_2 = bc^2 - bc^2 - b^2c + b^2c - ac^2 + ac^2 + ab^2 - ab^2 - a^2b + a^2b$  $\Rightarrow \Delta_1 + \Delta_2 = 0$ Thus, option (A) is correct. Checking Option (B). Multiplying 2 by (ii),  $2\Delta_2 = 2(ac^2 - ab^2 - bc^2 + b^2c + a^2b - a^2c)$  $\Rightarrow 2\Delta_2 = 2ac^2 - 2ab^2 - 2bc^2 + 2b^2c + 2a^2b - 2a^2c \dots$ (iii) Then, adding  $2\Delta_2$  with  $\Delta_1$ ,  $\Delta_1 + 2\Delta_2 = (bc^2 - b^2c - ac^2 + a^2c + ab^2 - a^2b) + (2ac^2 - 2ab^2 - 2bc^2 + 2b^2c + 2a^2b - 2a^2c)$  $\Rightarrow \Delta_1 + 2\Delta_2 = bc^2 - 2bc^2 - b^2c + 2b^2c - ac^2 + 2ac^2 + ab^2 - 2ab^2 - a^2b + 2a^2b$  $\Rightarrow \Delta_1 + 2\Delta_2 = -bc^2 + b^2c + ac^2 - ab^2 + a^2b$  $\Rightarrow \Delta_1 + 2\Delta_2 \neq 0$ Thus, option (B) is not correct. Checking option (C).

Obviously,  $\Delta_1 \neq \Delta_2$ 

Since, by (i) and (ii), we can notice  $\Delta_1$  and  $\Delta_2$  have different values.

Thus, option (C) is not correct.

## 8. Question

Mark the correct alternative in the following:

If 
$$D_k = \begin{vmatrix} 1 & n & n \\ 2k & n^2 + n + 2 & n^2 + n \\ 2k - 1 & n^2 & n^2 + n + 2 \end{vmatrix}$$
 and  $\sum_{k=1}^n D_k = 48$ , then n equals

**CLICK HERE** 

🕀 www.studentbro.in

A. 4

B. 6

C. 8

D. none of these

## Answer

We are given that,

$$\begin{vmatrix} x^{2} + 3x & x - 1 & x + 3 \\ x + 1 & -2x & x - 4 \\ x - 3 & x + 4 & 3x \end{vmatrix} = ax^{4} + bx^{3} + cx^{2} + dx + e$$

We need to find the value of e.

We know that,

Determinant of  $3 \times 3$  matrix is given as,

 $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$ =  $a_{11}$ .det  $\begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix}$  -  $a_{12}$ .det  $\begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix}$  +  $a_{13}$ .det  $\begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}$ 

#### 9. Question

Mark the correct alternative in the following:

Let  $\begin{vmatrix} x^2 + 3x & x - 1 & x + 3 \\ x + 1 & -2x & x - 4 \\ x - 3 & x + 4 & 3x \end{vmatrix}$  =  $ax^4 + bx^3 + cx^2 + dx + e$  be an identify in x, were a, b, c, d, e are

independent of x. Then the value of e is

A. 4

B. 0

C. 1

D. none of these

#### Answer

We are given that,

 $\begin{vmatrix} x^2 + 3x & x - 1 & x + 3 \\ x + 1 & -2x & x - 4 \\ x - 3 & x + 4 & 3x \end{vmatrix} = ax^4 + bx^3 + cx^2 + dx + e$ 

We need to find the value of e.

We know that,

Determinant of  $3 \times 3$  matrix is given as,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}
\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31})
+ a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})
```

So,

 $\begin{vmatrix} x^2 + 3x & x - 1 & x + 3 \\ x + 1 & -2x & x - 4 \\ x - 3 & x + 4 & 3x \end{vmatrix} = ax^4 + bx^3 + cx^2 + dx + e$ 

$$\Rightarrow (x^{2} + 3x).\det \begin{bmatrix} -2x & x - 4 \\ x + 4 & 3x \end{bmatrix} - (x - 1).\det \begin{bmatrix} x + 1 & x - 4 \\ x - 3 & 3x \end{bmatrix} \\ + (x + 3).\det \begin{bmatrix} x + 1 & -2x \\ x - 3 & x + 4 \end{bmatrix} = ax^{4} + bx^{3} + cx^{2} + dx + e$$

 $\Rightarrow (x^{2} + 3x)[-2x \times 3x - (x - 4)(x + 4)] - (x - 1)[(x + 1) \times 3x - (x - 4)(x - 3)] + (x + 3)[(x + 1)(x + 4) - (-2x)(x - 3)] = ax^{4} + bx^{3} + cx^{2} + dx + e$ 

 $\Rightarrow (x^{2} + 3x)[-6x - (x^{2} - 16)] - (x - 1)[3x(x + 1) - (x^{2} - 3x - 4x + 12)] + (x + 3)[x^{2} + x + 4x + 4 + 2x(x - 3)] = ax^{4} + bx^{3} + cx^{2} + dx + e$ 

 $\Rightarrow (x^{2} + 3x)[-6x - x^{2} + 16] - (x - 1)[3x^{2} + 3x - x^{2} + 7x - 12] + (x + 3)[x^{2} + 5x + 4 + 2x^{2} - 6x] = ax^{4} + bx^{3} + cx^{2} + dx + e$   $\Rightarrow -x^{4} - 6x^{3} + 16x^{2} - 3x^{3} - 18x^{2} + 48x - (x - 1)[2x^{2} + 10x - 12] + (x + 3)[3x^{2} - x + 4] = ax^{4} + bx^{3} + cx^{2} + dx + e$   $\Rightarrow -x^{4} - 9x^{3} - 2x^{2} + 48x - (2x^{3} - 2x^{2} + 10x^{2} - 10x - 12x + 12) + 3x^{3} + 9x^{2} - x^{2} - 3x + 4x + 12 = ax^{4} + bx^{3} + cx^{2} + dx + e$   $\Rightarrow -x^{4} - 9x^{3} - 2x^{2} + 48x - 2x^{3} + 2x^{2} - 10x^{2} + 10x + 12x - 12 + 3x^{3} + 9x^{2} - x^{2} - 3x + 4x + 12 = ax^{4} + bx^{3} + cx^{2} + dx + e$   $\Rightarrow -x^{4} - 9x^{3} - 2x^{2} + 48x - 2x^{3} + 2x^{2} - 10x^{2} + 10x + 12x - 12 + 3x^{3} + 9x^{2} - x^{2} - 3x + 4x + 12 = ax^{4} + bx^{3} + cx^{2} + dx + e$   $\Rightarrow -x^{4} - 9x^{3} - 2x^{3} + 3x^{3} - 2x^{2} + 2x^{2} + 9x^{2} - x^{2} + 48x + 10x + 12x - 3x + 4x - 12 + 12 = ax^{4} + bx^{3} + cx^{2} + dx + e$   $\Rightarrow -x^{4} - 8x^{3} + 8x^{2} + 23x + 0 = ax^{4} + bx^{3} + cx^{2} + dx + e$ Comparing left hand side and right-hand side of the equation, we get

e = 0

Thus, e = 0.

#### 10. Question

Mark the correct alternative in the following:

Using the factor theorem it is found that a + b, b + c and c + a are three factors of the determinant

 $\begin{vmatrix} -2a & a+b & a+c \\ b+a & -2b & b+c \\ c+a & c+b & -2c \end{vmatrix}$ . The other factor in the value of the determinant is

## A. 4

B. 2

C.a + b + c

D. none of these

#### Answer

 $\begin{vmatrix} -2a & a+b & c+a \\ a+b & -2b & b+c \\ c+a & b+c & -2c \end{vmatrix} = k(a+b)(b+c)(c+a)$ 

Let assume a=0, b=1, c=2

$$\begin{vmatrix} 0 & 1 & 2 \\ 1 & -2 & 3 \\ 2 & 3 & -2 \end{vmatrix} = k(a+b)(b+c)(c+a)$$
$$\begin{vmatrix} 0 & 1 & 2 \\ 1 & -2 & 3 \\ 2 & 3 & -2 \end{vmatrix} = k(0+1)(1+2)(2+0)$$

Now expending around colume1

0-1(-4-6)+2(3+4)=k(1)(3)(2)

6k=24

K=4

## 11. Question

Mark the correct alternative in the following:

If a, b, c are distinct then the value of x satisfying  $\begin{vmatrix} 0 & x^2 - a & x^3 - b \\ x^2 + a & 0 & x^2 + c \\ x^4 + b & x - c & 0 \end{vmatrix} = 0$  is

А. с

В. а

C. b

D. 0

# Answer

 $\Delta = \begin{vmatrix} 0 & x^2 - a & x^3 - b \\ x^2 + a & 0 & x^2 + c \\ x^4 + b & x - c & 0 \end{vmatrix}$  $\Delta = \begin{vmatrix} 0 & x^2 + a & x^4 + b \\ x^2 - a & 0 & x - c \\ x^3 - b & x^2 + c & 0 \end{vmatrix}$  $2\Delta = \begin{vmatrix} 0 & 2x^2 & x^4 + x^3 \\ 2x^2 & 0 & x^2 + x \\ x^3 + x^4 & x^2 + x & 0 \end{vmatrix}$ 

 $\Delta = 0$  (this is possible when x=0)

# 12. Question

Mark the correct alternative in the following:

If the determinant  $\begin{vmatrix} a & b & 2a\alpha + 3b \\ b & c & 2b\alpha + 3c \\ 2a\alpha + 3b & 2b\alpha + 3c & 0 \end{vmatrix} = 0$ , then

A. a, b, c are in H.P.

B.  $\alpha$  is a root of  $4ax^2 + 12bx + 9c = 0$  or, a, b, c are in G.P.

C. a, b, c are in G.P. only

D. a, b, c are in A.P.

# Answer

expend the determinats

```
a[-(2b\alpha+3c)^2]-b[-(2b\alpha+3c)(2a\alpha+3b)]+(2a\alpha+3b)[b(2b\alpha+3c)-c(2a\alpha+3b)]=0
```

 $-a(2b\alpha+3c)^2 + b(2b\alpha+3c)(2a\alpha+3b) + (2a\alpha+3b)[2b^2\alpha+3bc-3bc-2ac\alpha] = 0$ 

 $(2b\alpha+3c) [-2ab\alpha-3ac+2ab\alpha+3b^2] + (2a\alpha+3b)(2\alpha)(b^2-ac)=0$ 

 $(2b\alpha+3c)$  [-3ac +3b<sup>2</sup>]+  $(2a\alpha+3b)(2\alpha)(b^{2}-ac)=0$ 

 $(b^2 - ac)[4a\alpha^2 + 12b\alpha + ac] = 0 =$ 

CASE1→( $b^2$  -ac)=0

b<sup>2</sup> =ac {abc are in Gp}

 $CASE2 \rightarrow (4a\alpha^2 + 12b\alpha + ac) = 0$  {Whose one root is  $\alpha$ }

# 13. Question

If  $\omega$  is a non-real cube root of unity and n is not a multiple of 3, then  $\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^{2n} & 1 & \omega^n \\ \omega^n & \omega^{2n} & 1 \end{vmatrix}$  is equal to

A. 0

Β. ω

C. ω<sup>2</sup>

D. 1

# Answer

Assume that n=2(not multiple of 3)

$$\begin{split} \Delta &= \begin{vmatrix} 1 & w^2 & w^4 \\ w^4 & 1 & w^2 \\ w^2 & w^4 & 1 \end{vmatrix} \\ \Delta &= \begin{vmatrix} 1 & w^2 & w \\ w & 1 & w^2 \\ w^2 & w & 1 \end{vmatrix} \text{ expend the determinant} \\ \Delta &= 1(1 - w^3) - w^2 (w - w^4) + w(w^2 - w^2) \\ \Delta &= 1 - w^3 - w^3 + w^6 + w^3 - w^3 \\ \Delta &= 0 \end{split}$$

# 14. Question

1

Mark the correct alternative in the following:

If 
$$A_r = \begin{vmatrix} 1 & r & 2^r \\ 2 & n & n^2 \\ n & \frac{n(n+1)}{2} & 2^{n+1} \end{vmatrix}$$
 , then the value of  $\sum_{r=1}^n A_r$  is

A. n

B. 2n

C. -2n

D. n<sup>2</sup>

# Answer

$$\begin{split} &\sum_{r=1}^{n} A_{r} = \begin{vmatrix} 1 & \sum_{r=1}^{n} r & \sum_{r=1}^{n} 2^{r} \\ 2 & n & n^{2} \\ n & \frac{n(n+1)}{2} & 2^{n+1} \end{vmatrix} \\ &\sum_{r=1}^{n} A_{r} = \begin{vmatrix} 1 & \frac{n(n+1)}{2} & 2(2^{n}-1) \\ 2 & n & n^{2} \\ n & \frac{n(n+1)}{2} & 2^{n+1} \end{vmatrix} \text{ assume (n)=1} \\ &\sum_{r=1}^{n} A_{r} = \begin{vmatrix} 1 & 1 & 2 \\ 2 & 1 & 1 \\ 1 & 1 & 4 \end{vmatrix} \end{split}$$

1(4-1)-1(8-1) + 2(2-1) = -2

Answer=c(-2n)

## 15. Question

Mark the correct alternative in the following:

	а	b	ax + b	
If a > 0 and discriminant of ax^2 + 2bx + c is negative, then $\Delta =$	b	с	bx + c	is
	ax + b	bx + c	0	

## A. positive

```
B. (ac - b^2)(ax^2 + 2bx + c)
```

C. negative

D. 0

# Answer

discriminant of  $ax^2 + 2bx + c = 0$ 

 $4b^2 - 4ac < 0$  and  $ax^2 + 2bx + c > 0$ 

```
\Delta = \begin{vmatrix} a & b & ax+b \\ b & c & bx+c \\ ax+b & bx+c & 0 \end{vmatrix}R_3 \rightarrow R_3 - X R_1 - R_2\Delta = \begin{vmatrix} a & b & ax+b \\ b & c & bx+c \\ 0 & 0 & -(2ax+2bx+c) \end{vmatrix}
```

```
-(2ax + 2bx + c)(-b^2 + ac) < 0
```

# 16. Question

Mark the correct alternative in the following:

The value of  $\begin{vmatrix} 5^2 & 5^3 & 5^4 \\ 5^3 & 5^4 & 5^5 \\ 5^4 & 5^5 & 5^6 \end{vmatrix}$  is

A. 5<sup>2</sup>

B. 0

C. 5<sup>13</sup>

D. 5<sup>9</sup>

# Answer

 $\Delta = \begin{vmatrix} 5^2 & 5^3 & 5^4 \\ 5^3 & 5^4 & 5^5 \\ 5^4 & 5^5 & 5^6 \end{vmatrix}$  $\Delta = 5^9 \begin{vmatrix} 1 & 5 & 5^2 \\ 1 & 5 & 5^2 \\ 1 & 5 & 5^2 \\ 1 & 5 & 5^2 \end{vmatrix}$ 

 $\Delta = 5^9 5^3 \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix}$ 

Δ=0

# 17. Question

Mark the correct alternative in the following:

```
\begin{vmatrix} \log_3 512 & \log_4 3 \\ \log_3 8 & \log_4 9 \end{vmatrix} \times \begin{vmatrix} \log_2 3 & \log_8 3 \\ \log_3 4 & \log_3 4 \end{vmatrix} =
A. 7

B. 10

C. 13

D. 17

Answer

= \begin{vmatrix} \log_3 512 & \log_4 3 \\ \log_3 8 & \log_4 9 \end{vmatrix} \times \begin{vmatrix} \log_2 3 & \log_8 3 \\ \log_3 4 & \log_3 4 \end{vmatrix}
= \begin{vmatrix} 9\log_3 2 & \log_4 3 \\ 3\log_3 2 & 2\log_4 3 \end{vmatrix} \times \begin{vmatrix} \log_2 3 & \frac{1}{3}\log_2 3 \\ 2\log_3 2 & 2\log_3 2 \end{vmatrix}
= \log_3 2\log_4 3\log_2 3\log_3 2 \begin{vmatrix} 9 & 1 \\ 3 & 2 \end{vmatrix} \times \begin{vmatrix} 1 & \frac{1}{3} \\ 2 & 2 \end{vmatrix}
```

Mark the correct alternative in the following:

	x + 2	x + 3	x + 2a
If a, b, c are in A.P., then the determinant	x + 3	x + 4	x + 2b
If a, b, c are in A.P., then the determinant	x + 4	x + 5	x + 2c

A. 0

 $=\frac{1}{2}\begin{vmatrix} 9+2 & 3+2\\ 3+4 & 1+4 \end{vmatrix}$ 

 $=\frac{1}{2}\begin{vmatrix} 11 & 5\\ 7 & 5 \end{vmatrix}$ 

 $=\frac{1}{2}(55-35)$ 

18. Question

=10

- B. 1
- С. х
- D. 2x

#### Answer

```
\Delta = \begin{vmatrix} x+2 & x+3 & x+2a \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix}

\{a + c = 2b\}

R_1 \rightarrow R_1 - R_2

R_2 \rightarrow R_2 - R_3

\Delta = \begin{vmatrix} -1 & -1 & a-c \\ -1 & -1 & a-c \\ x+4 & x+5 & x+2c \end{vmatrix}

R_1 \rightarrow R_1 - R_2

\Delta = \begin{vmatrix} 0 & 0 & 0 \\ -1 & -1 & a-c \\ x+4 & x+5 & x+2c \end{vmatrix}

\Delta = \begin{vmatrix} 0 & 0 & 0 \\ -1 & -1 & a-c \\ x+4 & x+5 & x+2c \end{vmatrix}

\Delta = 0
```

## 19. Question

Mark the correct alternative in the following:

If A + B + C = 
$$\pi$$
, then the value of  $\begin{vmatrix} \sin(A + B + C) & \sin(A + C) & \cos C \\ -\sin B & 0 & \tan A \\ \cos(A + B) & \tan(B + C) & 0 \end{vmatrix}$  is equal to

A. 0

B. 1

- C. 2sin B tan A cos C
- D. none of these

### Answer

```
\Delta = \begin{vmatrix} \sin \pi & \sin \pi - B & \cos C \\ -\sin B & 0 & \tan A \\ \cos \pi - C & \tan \pi - A & 0 \end{vmatrix}\Delta = \begin{vmatrix} \sin \pi & \sin B & \cos C \\ -\sin B & 0 & \tan A \\ -\cos C & -\tan A & 0 \end{vmatrix}
```

## ON TRANSPOSING

$$\Delta = \begin{vmatrix} \sin \pi & -\sin B & -\cos C \\ \sin B & 0 & -\tan A \\ \cos C & \tan A & 0 \end{vmatrix}$$
$$2\Delta = \begin{vmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{vmatrix}$$
$$\Delta = 0$$

# 20. Question

Mark the correct alternative in the following:

	cosecx	sec x	sec x	
The number of distinct real roots of	sec x	cosecx	sec x	$= 0$ lies in the interval $-\frac{\pi}{4} \le x \le \frac{\pi}{4}$ is
	sec x	sec x	cosec x	4 4

A. 1

- B. 2
- С. З
- D. 0

# Answer

 $\Delta = \begin{vmatrix} cscx & secx & secx \\ secx & cscx & secx \\ secx & secx & cscx \end{vmatrix}$  $c_1 \rightarrow c_1 + c_2 + c_3$  $\Delta = \begin{vmatrix} \csc x + 2 \sec x & \sec x \\ 2 \sec x + \csc x & \csc x \\ 2 \sec x + \csc x & \sec x \\ 2 \sec x + \csc x & \sec x \\ \end{vmatrix}$  $\Delta = (\csc x + 2 \sec x) \begin{vmatrix} 1 & \sec x & \sec x \\ 1 & \csc x & \sec x \\ 1 & \sec x & \csc x \end{vmatrix}$  $\Delta = (\csc x + 2 \sec x)[(\csc x - \sec x)^2]$ Case1:  $(\csc x+2 \sec x)=0$  $\tan x = -\frac{1}{2}(1^{st} \text{ real root})$ 

Case:  $(\csc x \cdot \sec x)^2 = 0$ 

Tan x=1 (2<sup>nd</sup> real root)

# 21. Question

Mark the correct alternative in the following:

 $\text{Let } A = \begin{bmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{bmatrix} \text{, where } 0 \leq \theta \leq 2\pi \text{. Then,}$ 

- A. Det (A) = 0
- B. Det (A)  $\in$  (2,  $\infty$ )
- C. Det  $(A) \in (2, 4)$
- D. Det  $(A) \in [2, 4]$

# Answer

```
A = \begin{vmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{vmatrix}
R_1 \rightarrow R_1 + R_3
A = \begin{vmatrix} 0 & 0 & 2 \\ -\sin\theta & 1 & \sin\theta \\ -1 & -\sin\theta & 1 \end{vmatrix}
```

```
\mathsf{A}{=}2[(\sin\theta)^2{+}1]\;0{\leq}(\sin\theta)^2{\leq}1
```

A∈2[1,2]

A∈[2,4]

# 22. Question

Mark the correct alternative in the following:

If 
$$\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$$
, then x =  
A. 3  
B. ± 3  
C. ± 6  
D. 6  
**Answer**  
 $\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$ 

 $2x^2 - 40 = 18 + 14$ 

 $x=\pm 6$ 

# 23. Question

Mark the correct alternative in the following:

If 
$$f(x) = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix}$$
, then

A. f(a) = 0

B. 3bc

```
C. a^3 + b^3 + c^3 - 3abc
```

D. none of these

# Answer

 $f(x) = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix}$ 

# ON TRANSPOSING

$$f(x) = \begin{vmatrix} 0 & x + a & x + b \\ x - a & 0 & x + c \\ x - b & x - c & 0 \end{vmatrix}$$
$$2f(x) = \begin{vmatrix} 0 & 2x & 2x \\ 2x & 0 & 2x \\ 2x & 2x & 0 \end{vmatrix}$$
$$2f(x) = 8 \begin{vmatrix} 0 & x & x \\ x & 0 & x \\ x & x & 0 \end{vmatrix}$$
$$f(x) = 4[-x(-x^2) + x(x^2 - 0)]$$

 $f(x) = 8x^3$ 

## 24. Question

Mark the correct alternative in the following:

The value of the determinant  $\begin{vmatrix} a-b & b+c & a \\ b-a & c+a & b \\ c-a & a+b & c \end{vmatrix} \text{ is }$ 

A.  $a^3 + b^3 + c^3$ 

B. 3bc

C.  $a^3 + b^3 + c^3 - 3abc$ 

D. none of these

#### Answer

assume a=1,b=2, c=3 (put in determinant)

 $\Delta = \begin{vmatrix} -1 & 5 & 1 \\ 1 & 4 & 2 \\ 2 & 3 & 3 \end{vmatrix}$ 

 $\Delta = [-1(12-6)-5(3-4)+1(3-6)]$ 

## ∆=-4

put a=1,b=2, c=3 in option A,B,C,D

ANSWER=D(none of these )

## 25. Question

Mark the correct alternative in the following:

If x, y, z are different from zero and  $\begin{vmatrix} 1+x & 1 & 1 \\ 1 & 1+y & 1 \\ 1 & 1 & 1+z \end{vmatrix} = 0$ , then the value of  $x^{-1} + y^{-1} + z^{-1}$  is

A. xyz

B.  $x^{-1}y^{-1}z^{-1}$ 

C. -x -y - z

D. -1

## Answer

 $\begin{vmatrix} 1+x & 1 & 1 \\ 1 & 1+y & 1 \\ 1 & 1 & 1+z \end{vmatrix} = 0$   $c_1 \rightarrow c_1 - c_2$   $c_3 \rightarrow c_3 - c_2$   $\begin{vmatrix} x & 1 & 0 \\ -y & 1+y & -y \\ 0 & 1 & z \end{vmatrix} = 0$  x[(1+y)z+y]-1[-yz]=0xz + xyz + xy + yz = 0 (divide by xyz in both side)

# Get More Learning Materials Here : 📕

$$\frac{1}{x} + \frac{1}{y} + \frac{1}{z} = -1$$

## 26. Question

Mark the correct alternative in the following:

The determinant  $\begin{vmatrix} b^2 - ab & b - c & bc - ac \\ ab - a^2 & a - b & a^2 - ab \\ bc - ca & c - a & ab - a^2 \end{vmatrix}$  equals

- A. abc(b c)(c a)(a b)
- B. (b c)(c a)(a b)
- C. (a + b + c)(b c)(c a)(a b)
- D. none of these

#### Answer

assume a=1,b=2, c=3 (put in determinant)

$$\Delta = \begin{vmatrix} 2 & -1 & 3 \\ 1 & -1 & -1 \\ 3 & 2 & 1 \end{vmatrix}$$

 $\Delta = [2(-1+2) + 1(1+3) + 3(2+3)]$ 

put a=1,b=2, c=3 in option A,B,C,D

ANSWER=D(none of these )

#### 27. Question

Mark the correct alternative in the following:

If x, y  $\in$  R, then the determinant  $\Delta = \begin{vmatrix} \cos x & -\sin x & 1 \\ \sin x & \cos x & 1 \\ \cos(x+y) & -\sin(x+y) & 0 \end{vmatrix}$  lies in the interval

A. 
$$\left[-\sqrt{2}, \sqrt{2}\right]$$
 B. [-1, 1]  
C.  $\left[-\sqrt{2}, 1\right]$  D.  $\left[-1, -\sqrt{2}\right]$ 

Answer

 $\Delta = \begin{vmatrix} \cos x & -\sin x & 1 \\ \sin x & \cos x & 1 \\ \cos(x+y) & -(\sin(x+y) & 0 \end{vmatrix}$ 

 $\cos(x+y) = \cos x \cos y - \sin x \sin y$ 

sin(x + y) = sin x cos y + cos x sin y

 $\Delta = \begin{vmatrix} \cos x & -\sin x & 1\\ \sin x & \cos x & 1\\ \cos x \cos y - \sin x \sin y & -(\sin x \cos y + \cos x \sin y) & 0 \end{vmatrix}$ 

 $\rm R_3 \rightarrow R_{3-} \cos y \, R_1 + \sin y \, \, R_2$ 

$$\Delta = \begin{vmatrix} \cos x & -\sin x & 1\\ \sin x & \cos x & 1\\ 0 & 0 & \sin y - \cos y \end{vmatrix}$$
$$\Delta = (\sin y - \cos y)[(\cos x)^2 + (\sin x)^2]$$
$$= (\sin y - \cos y)$$
$$= -(\cos y - \sin y)$$
$$\Delta = -\sqrt{2}[(\frac{1}{\sqrt{2}}\cos y - \frac{1}{\sqrt{2}}\sin y)]$$
$$\Delta = -\sqrt{2}[(\sin \frac{\pi}{4}\cos y - \cos \frac{\pi}{4}\sin y)]$$
$$\Delta = -\sqrt{2}[\sin(\frac{\pi}{4} - y)] - 1 \le \sin(\frac{\pi}{4} - y) \le 1$$
$$\Delta \in [-\sqrt{2}, \sqrt{2}]$$

## 28. Question

Mark the correct alternative in the following:

The maximum value of  $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 + \cos \theta & 1 & 1 \end{vmatrix}$  is ( $\theta$  is real)

A. 
$$\frac{1}{2}$$
  
B.  $\frac{\sqrt{3}}{2}$   
C.  $\sqrt{2}$   
D.  $-\frac{\sqrt{3}}{2}$ 

## Answer

 $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 + \cos \theta & 1 & 1 \end{vmatrix}$   $c_1 \rightarrow c_1 - c_3$   $\Delta = \begin{vmatrix} 0 & 1 & 1 \\ 0 & 1 + \sin \theta & 1 \\ \cos \theta & 1 & 1 \end{vmatrix}$   $\Delta = \cos \theta (1 - 1 - \sin \theta)$   $\Delta = -\cos \theta \sin \theta$   $\Delta = -\frac{1}{2} \sin 2\theta$   $-1 \le \sin 2\theta \le 1$   $\Delta = \frac{1}{2} [\theta = -\frac{\pi}{4}]$ 29. Question

Mark the correct alternative in the following:

# The value of the determinant $\begin{vmatrix} x & x+y & x+2y \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix}$ is

A.  $9x^{2}(x + y)$ 

- B.  $9y^{2}(x + y)$
- C.  $3y^{2}(x + y)$
- D.  $7x^{2}(x + y)$

# Answer

$$\begin{split} \Delta &= \begin{vmatrix} x & x+y & x+2y \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix} \\ R_1 &\to R_1 - R_3 \\ R_2 &\to R_2 - R_3 \\ \Delta &= \begin{vmatrix} -y & -y & 2y \\ y & -2y & y \\ x+y & x+2y & x \end{vmatrix} \\ \Delta &= y^2 \begin{vmatrix} -1 & -1 & 2 \\ 1 & -2 & 1 \\ x+y & x+2y & x \end{vmatrix} \\ R_1 &\to R_1 + R_2 \\ \Delta &= y^2 \begin{vmatrix} 0 & -3 & 3 \\ 1 & -2 & 1 \\ x+y & x+2y & x \end{vmatrix} \\ A &= y^2 \begin{bmatrix} 0 & -3 & 3 \\ 1 & -2 & 1 \\ x+y & x+2y & x \end{vmatrix} \\ \Delta &= y^2 \begin{bmatrix} -1(-3x - 3x - 6y) + (x+y)(-3 + 6) \end{bmatrix} \\ \Delta &= y^2 [6(x+y) + 3(x+y)] \\ \Delta &= 9y^2 (x+y) \end{split}$$

# 30. Question

Mark the correct alternative in the following:

Let 
$$f(x) = \begin{vmatrix} \cos x & x & 1 \\ 2\sin x & x & 2x \\ \sin x & x & x \end{vmatrix}$$
, then  $\lim_{x \to 0} \frac{f(x)}{x^2}$  is equal to  
A. 0  
B. -1  
C. 2  
D. 3  
Answer  
 $f(x) = x[(-x\cos x) + \sin x]$   
 $f(x) = (-x^2\cos x) + x\sin x$ 

CLICK HERE ( >>

 $\lim_{x \to 0} \frac{f(x)}{x^2} = \lim_{x \to 0} \frac{-x^2 \cos(x) + x \sin x}{x^2}$  $\lim_{x \to 0} \frac{-x^2 \cos(x)}{x^2} + \lim_{x \to 0} \frac{x \sin x}{x^2}$  $\lim_{x \to 0} -\cos x = -1$  $\lim_{x \to 0} \frac{\sin x}{x} = 1$ ANSWER= -1 + 1 = 0

## 31. Question

Mark the correct alternative in the following:

There are two values of a which makes the determinant  $\Delta = \begin{vmatrix} 1 & -2 & 5 \\ 2 & a & -1 \\ 0 & 4 & 2a \end{vmatrix}$  equal to 86. The sum of these two

values is

A. 4

B. 5

C. -4

D. 9

#### Answer

 $\Delta = \begin{vmatrix} 1 & -2 & 5 \\ 2 & a & -1 \\ 0 & 4 & 2a \end{vmatrix}$  $\Delta = (2a^{2} + 4) + 2(4a) + 40$  $43 = a^{2} + 4a + 22$ Sum of roots =  $-\frac{b}{a}$  [b=1and a=1]

Sum of roots= -4

# 32. Question

Mark the correct alternative in the following:

If 
$$\begin{vmatrix} a & p & x \\ b & q & y \\ c & r & z \end{vmatrix} = 16$$
, then the value of  $\begin{vmatrix} p+q & a+x & a+p \\ q+y & b+y & b+q \\ x+z & c+z & c+r \end{vmatrix}$  is  
A. 4  
B. 8  
C. 16  
D. 32  
**Answer**  
 $\begin{vmatrix} p+q & a+x & a+p \\ q+y & b+y & b+q \\ x+z & c+z & c+r \end{vmatrix}$

# 33. Question

Mark the correct alternative in the following:

The value of  $\begin{vmatrix} 1 & 1 & 1 \\ {}^{n}C_{1} & {}^{n+2}C_{1} & {}^{n+4}C_{1} \\ {}^{n}C_{2} & {}^{n+2}C_{2} & {}^{n+4}C_{2} \end{vmatrix}$  is A. 2 B. 4 C. 8 D. n<sup>2</sup> Answer

 $\begin{vmatrix} 1 & 1 & 1 \\ {}^{n}C_{1} & {}^{n+2}C_{1} & {}^{n+4}C_{1} \\ {}^{n}C_{2} & {}^{n+2}C_{2} & {}^{n+4}C_{2} \end{vmatrix}$  $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ {}^{n} & {}^{n+2} & {}^{n+4} \\ {}^{n^{2}-n} & {}^{n^{2}+3n+2} & {}^{n^{2}+7n+12} \end{vmatrix}$  $c_{1} \rightarrow c_{1} - c_{2}$  $c_{2} \rightarrow c_{2} - c_{3}$  $\Delta = \begin{vmatrix} 0 & 0 & 1 \\ {}^{-2} & {}^{-2} & {}^{n+4} \\ {}^{-4n-2} & {}^{-4n-10} & {}^{n^{2}+7n+12} \end{vmatrix}$  $\Delta = 1/2 [8n+20-8n-4]$ 

Δ=8

# Very short answer

# 1. Question

If A is a singular matrix, then write the value of |A|.

# Answer

Since a singular matrix is a matrix whose determinant is 0, Therefore the determinant of A is 0.

# 2. Question

For what value of x, the matrix  $\begin{bmatrix} 5-x & x+1 \\ 2 & 4 \end{bmatrix}$  is singular?

## Answer

 $\mathbf{A} = \begin{bmatrix} 5 - \mathbf{x} \, \mathbf{x} + 1 \\ 2 & 4 \end{bmatrix}$ 

Hence  $|\mathbf{A}| = \begin{vmatrix} 5 - \mathbf{x} \, \mathbf{x} + 1 \\ 2 & 4 \end{vmatrix}$ 

=(5-x)×4-(x+1)×2 (Expanding along  $R_1$ )

|A|=18-6x

For A to be a singular matrix, |A| has to be 0.

Therefore, 18-6x=0 or x=3.

#### 3. Question

Write the value of the determinant  $\begin{vmatrix} 2 & 3 & 4 \\ 2x & 3x & 4x \\ 5 & 6 & 8 \end{vmatrix}$ .

#### Answer

Let  $\Delta = \begin{bmatrix} 2 & 3 & 4 \\ 2x & 3x & 4x \\ 5 & 6 & 8 \end{bmatrix}$ 

Using the property that if the equimultiples of corresponding elements of other rows (or columns) are added to every element of any row (or column) of a determinant, then the value of determinant remains the same

Using row transformation,  $R_2 \rightarrow R_2 - xR_1$ 

 $\Delta = \begin{vmatrix} 2 & 3 & 4 \\ 2x - 2x & 3x - 3x & 4x - 4x \\ 5 & 6 & 8 \end{vmatrix} = \begin{vmatrix} 2 & 3 & 4 \\ 0 & 0 & 0 \\ 5 & 6 & 8 \end{vmatrix}$ 

Using the property that if all elements of any row or column of a determinant are 0, then the value of determinant is 0.

CLICK HERE

🕀 www.studentbro.in

Since  $R_2$  has all elements 0, therefore  $\Delta = 0$ .

#### 4. Question

State whether the matrix  $\begin{bmatrix} 2 & 3 \\ 6 & 4 \end{bmatrix}$  is singular or non-singular.

#### Answer

Let  $A = \begin{bmatrix} 2 & 3 \\ 6 & 4 \end{bmatrix}$ 

Then  $|A| = \begin{vmatrix} 2 & 3 \\ 6 & 4 \end{vmatrix}$ 

=2×4-3×6

=-10 (Expanding along  $R_1$ )

Since  $|A| \neq 0$ , therefore A is a non-singular matrix.

#### 5. Question

Find the value of the determinant  $\begin{vmatrix} 4200 & 4201 \\ 4202 & 4203 \end{vmatrix}$ .

#### Answer

Let  $\Delta = \begin{vmatrix} 4200 & 4201 \\ 4202 & 4203 \end{vmatrix}$ =  $\begin{vmatrix} 0 + 4200 & 1 + 4200 \\ 2 + 4200 & 3 + 4200 \end{vmatrix}$ 

Using the property that if some or all elements of a row or column of a determinant are expressed as the sum of two (or more) terms, then the determinant can be expressed as the sum of two (or more) determinants.

We get,  $\Delta = \begin{vmatrix} 0 & 1 \\ 2 & 3 \end{vmatrix} + \begin{vmatrix} 4200 & 4200 \\ 4200 & 4200 \end{vmatrix}$ 

Using the property that If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then the value of the determinant is zero.

Hence,  $\Delta = \begin{vmatrix} 0 & 1 \\ 2 & 3 \end{vmatrix} + 0$ 

 $=0\times3-1\times2=-2$  (Expanding along R<sub>1</sub>)

#### 6. Question

	101	102	103	
Find the value of the determinant	104	105	106	
	107	108	109	

#### Answer

Let  $\Delta = \begin{vmatrix} 101 & 102 & 103 \\ 104 & 105 & 106 \\ 107 & 108 & 109 \end{vmatrix}$  $= \begin{vmatrix} 1 + 100 & 2 + 100 & 3 + 100 \\ 4 + 100 & 5 + 100 & 6 + 100 \\ 7 + 100 & 8 + 100 & 9 + 100 \end{vmatrix}$ 

Using the property that if some or all elements of a row or column of a determinant are expressed as the sum of two (or more) terms, then the determinant can be expressed as the sum of two (or more) determinants.

We get,  $\Delta = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix} + \begin{bmatrix} 100 & 100 & 100 \\ 100 & 100 & 100 \\ 100 & 100 & 100 \end{bmatrix}$ 

Using the property that If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then the value of the determinant is zero.

We get, 
$$\Delta = \begin{vmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{vmatrix} + 0$$
$$= \begin{vmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{vmatrix}$$

Using the property that if the equimultiples of corresponding elements of other rows (or columns) are added to every element of any row (or column) of a determinant, then the value of determinant remains the same.

**CLICK HERE** 

Using row transformation,  $R_2 \rightarrow R_2 - R_1$  and  $R_3 = R_3 - R_1$ 

Get More Learning Materials Here : 📕

🕀 www.studentbro.in

We get, 
$$\Delta = \begin{vmatrix} 1 & 2 & 3 \\ 4 - 15 - 26 - 3 \\ 7 - 18 - 29 - 3 \end{vmatrix}$$
$$= \begin{vmatrix} 123 \\ 333 \\ 666 \end{vmatrix}$$
$$= \begin{vmatrix} 1 & 2 & 3 \\ 3 & 3 & 3 \\ 2 \times 32 \times 32 \times 3 \end{vmatrix}$$

Using the property that if each element of a row (or a column) of a determinant is multiplied by a constant k, then its value gets multiplied by k.

Taking out factor 2 from R<sub>3</sub>,

We get, 
$$\Delta = 2 \begin{vmatrix} 1 & 2 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{vmatrix}$$

Using the property that If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then the value of the determinant is zero.

Since,  $R_2$  and  $R_3$  are identical, therefore  $\Delta = 0$ .

#### 7. Question

Write the value of the determinant  $\begin{vmatrix} a & 1 & b+c \\ b & 1 & c+a \\ c & a & a+b \end{vmatrix}$ .

#### Answer

Let  $\Delta = \begin{bmatrix} a \ 1 \ b + c \\ b \ 1 \ c + a \\ c \ a \ a + b \end{bmatrix}$ 

Using the property that if the equimultiples of corresponding elements of other rows (or columns) are added to every element of any row (or column) of a determinant, then the value of determinant remains the same.

Using column transformation,  $C_1 \rightarrow C_1 + C_3$ 

We get,  $\Delta = \begin{vmatrix} a+b+c \ 1 \ b+c \\ b+c+a \ 1 \ c+a \\ c+a+b \ a \ a+b \end{vmatrix}$ 

Using the property that if each element of a row (or a column) of a determinant is multiplied by a constant k, then its value gets multiplied by k.

Taking out factor(a+b+c) from C<sub>1</sub>,

We get,  $\Delta = (a + b + c) \times \begin{vmatrix} 1 & 1 & b + c \\ 1 & 1 & c + a \\ 1 & a & a + b \end{vmatrix}$ 

Using column transformation,  $C_1 \rightarrow C_1 - C_2$ 

We get,

$$\Delta = (a + b + c) \times \begin{vmatrix} 0 & 1 & b + c \\ 0 & 1 & c + a \\ 1 - a & a + b \end{vmatrix}$$

Expanding along  $C_1$ , we get

 $\Delta = (a + b + c) \times [(1-a)(c + a - (b + c))] = (1-a)(a-b)(a + b + c)$

## 8. Question

If 
$$A = \begin{bmatrix} 0 & i \\ i & 1 \end{bmatrix}$$
 and  $B = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}$ , find the value of  $|A| + |B|$ .

## Answer

Given that  $A = \begin{bmatrix} 0 & i \\ i & 1 \end{bmatrix}$  and  $B = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}$ , we have to find |A| + |B|Then,  $|A| = \begin{vmatrix} 0 & i \\ i & 1 \end{vmatrix}$  and  $|B| = \begin{vmatrix} 0 & 1 \\ 1 & 1 \end{vmatrix}$   $|A| = 0 \times 1 \cdot i \times i$   $= -i^2$ =1 (Expanding along R<sub>1</sub> and since  $i^2 = -1$ )  $|B| = 0 \times 1 \cdot 1 \times 1$  = -1 (Expanding along R<sub>1</sub>) |A| + |B| = 1 - 1

0

## 9. Question

If 
$$A = \begin{bmatrix} 1 & 2 \\ 3 & -1 \end{bmatrix}$$
 and  $B = \begin{bmatrix} 1 & 0 \\ -1 & 0 \end{bmatrix}$ , find |AB|.

#### Answer

Given that  $A = \begin{bmatrix} 1 & 2 \\ 3 & -1 \end{bmatrix}$  and  $B = \begin{bmatrix} 1 & 0 \\ -1 & 0 \end{bmatrix}$ , we have to find |AB| Then,  $|A| = \begin{vmatrix} 1 & 2 \\ 3 & -1 \end{vmatrix}$  and  $|B| = \begin{vmatrix} 1 & 0 \\ -1 & 0 \end{vmatrix}$   $|A|=1\times -1-2\times 3$ =-7 (Expanding along R<sub>1</sub>)  $|B|=1\times 0-0\times -1$ =0 (Expanding along R<sub>1</sub>) Since |AB|=|A||B|,

Therefore |AB|=-7×0=0

## **10. Question**

Evaluate:  $\begin{vmatrix} 4785 & 4787 \\ 4789 & 4791 \end{vmatrix}$ .

## Answer

Let  $\Delta = \begin{vmatrix} 4785 & 4787 \\ 4789 & 4791 \end{vmatrix} = \begin{vmatrix} 0 + 4785 & 2 + 4785 \\ 4 + 4785 & 6 + 4785 \end{vmatrix}$ 

Using the property that if some or all elements of a row or column of a determinant are expressed as the sum of two (or more) terms, then the determinant can be expressed as the sum of two (or more) determinants.

We get,  $\Delta = \begin{vmatrix} 0 & 2 \\ 4 & 6 \end{vmatrix} + \begin{vmatrix} 4785 & 4785 \\ 4785 & 4785 \end{vmatrix}$ 

Using the property that If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then the value of the determinant is zero.

Hence, 
$$\Delta = \begin{vmatrix} 0 & 2 \\ 4 & 6 \end{vmatrix} + 0$$

 $=0\times6-2\times4=-8$  (Expanding along R<sub>1</sub>)

## 11. Question

If w is an imaginary cube root of unity, find the value of  $\begin{vmatrix} 1 & w & w^2 \\ w & w^2 & 1 \\ w^2 & 1 & w \end{vmatrix}$ .

#### Answer

Let  $\Delta = \begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix}$ 

Using the property that if the equimultiples of corresponding elements of other rows (or columns) are added to every element of any row (or column) of a determinant, then the value of determinant remains the same

Using row transformation,  $R_2 \rightarrow R_2 - \omega R_1$ 

$$\Delta = \begin{vmatrix} 1 & \omega & \omega^{2} \\ \omega - \omega & \omega^{2} - \omega^{2} & 1 - \omega^{3} \\ \omega^{2} & 1 & \omega \end{vmatrix}$$
$$= \begin{vmatrix} 1 & \omega & \omega^{2} \\ 0 & 0 & 0 \\ \omega^{2} & 1 & \omega \end{vmatrix}$$
 (Since,  $\omega$  is a cube root of 1, therefore  $\omega^{3}=1$ )

Using the property that if all elements of a row or column of a determinant are 0, the value of determinant is 0.

Hence  $\Delta = 0$ 

## 12. Question

If 
$$A = \begin{bmatrix} 1 & 2 \\ 3 & -1 \end{bmatrix}$$
 and  $B = \begin{bmatrix} 1 & -4 \\ 3 & -2 \end{bmatrix}$ , find  $|AB|$ .

#### Answer

Given that  $A = \begin{bmatrix} 1 & 2 \\ 3 & -1 \end{bmatrix}$  and  $B = \begin{bmatrix} 1 & -4 \\ 3 & -2 \end{bmatrix}$ , we have to find |AB| Then,  $|A| = \begin{vmatrix} 1 & 2 \\ 3 & -1 \end{vmatrix}$  and  $|B| = \begin{vmatrix} 1 & -4 \\ 3 & -2 \end{vmatrix}$   $|A|=1\times -1-2\times 3$  = -7 (Expanding along R<sub>1</sub>)  $|B|=1\times(-2)-(-4)\times 3$  = 10 (Expanding along R<sub>1</sub>) Since |AB|=|A||B|, Therefore  $|AB|=-7\times 10=-70$ **13. Question** 

If A =  $[a_{ij}]$  is a 3 × 3 diagonal matrix such that  $a_{11} = 1$ ,  $a_{22} = 2$  and  $a_{33} = 3$ , then find |A|.

Get More Learning Materials Here : 💴

CLICK HERE

## Answer

Since A is a diagonal matrix, therefore, all it's non-diagonal members are 0. And  $a_{11}=1$ ,  $a_{22}=2$  and  $a_{33}=3$ 

We get 
$$A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{bmatrix}$$
  
Then,  $|A| = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{bmatrix}$ 

Expanding along  $\mathsf{R}_1$ 

 $|A| = 1(2 \times 3 - 0) = 6$ 

# 14. Question

If A =  $[a_{ij}]$  is a 3 × 3 scalar matrix such that  $a_{11} = 2$ , then write the value of |A|.

## Answer

A scalar matrix is a matrix of order m which is equal to a constant  $\lambda$  multiplied with the Identity matrix of order m.

Since  $a_{11}=2$ , hence  $\lambda=2$  and m=3

Hence 
$$A = 2I = 2 \times \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix}$$
  
Then,  $|A| = \begin{bmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix}$ 

Expanding along  $R_1$ 

|A|=2(2×2-0)

=8

# 15. Question

If  $I_3$  denotes identity matrix of order 3  $\times$  3, write the value of its determinant.

## Answer

$$\begin{split} I_3 &= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ \text{Then, } |I_3| &= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \end{split}$$

Expanding along  $\mathsf{R}_1$ 

 $|I_3| = 1(1 \times 1 - 0)$ 

=1

# 16. Question

A matrix A of order  $3 \times 3$  has determinant 5. What is the value of |3A|?

# Answer

If the determinant of a matrix A of order m is  $\Delta$ , then the determinant of matrix  $\lambda A$ , where  $\lambda$  is a scalar, is  $\lambda^m \Delta$ .

In this question,  $\Delta$ =5,  $\lambda$ =3 and m=3.

 $|\lambda A| = 3^3 \times 5$ 

=135

## 17. Question

On expanding by first row, the value of the determinant of  $3 \times 3$  square matrix  $A = [a_{j}]$  is  $a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13}$ , where  $C_{ij}$  is the cofactor of  $a_{ij}$  is the cofactor of  $a_{ij}$  in A. Write the expression for its value of expanding by second column.

## Answer

The value of determinant written in the form of cofactors is equal to the sum of products of elements of that row (or column) multiplied by their corresponding cofactors.

Hence, the value of determinant |A|, of matrix  $A=[a_{ij}]$  of order 3×3, expanded along column 2 will be

 $|A| = a_{12} \times C_{12} + a_{22} \times C_{22} + a_{32} \times C_{32}$ 

## 18. Question

Let A =  $[a_{ij}]$  be a square matrix of order 3 × 3 and  $C_{ij}$  denote cofactor of  $a_{ij}$  in A. If |A| = 5, write the value of  $a_{31}C_{31} + a_{32}C_{32} + a_{33}C_{33}$ .

## Answer

The value of determinant |A||, of matrix  $A = [a_{ii}]$  of order 3×3, is given to be 5.

The value of determinant written in the form of cofactors is equal to the sum of products of elements of that row (or column) multiplied by their corresponding cofactors.

The value of |A| expanded along row 3 will be

 $|A| = a_{31} \times C_{31} + a_{32} \times C_{32} + a_{33} \times C_{33}$ , which is the required expression

Hence, the value of required expression is equal to |A|=5.

# 19. Question

In question 18, write the value of  $a_{11}C_{21} + a_{12}C_{22} + a_{13}C_{23}$ .

# Answer

We have to find out the value of  $a_{11} \times C_{21} + a_{12} \times C_{22} + a_{13} \times C_{23}$ 

```
LetI = a_{11} \times C_{21} + a_{12} \times C_{22} + a_{13} \times C_{23}
```

 $I = a_{11} \times (a_{12}a_{33} - a_{13}a_{32}) + a_{12} \times (a_{11}a_{33} - a_{13}a_{31}) + a_{13} \times (a_{11}a_{32} - a_{12}a_{31})$ 

 $\mathsf{I} = -\mathsf{a}_{11}\mathsf{a}_{12}\mathsf{a}_{33} + \mathsf{a}_{11}\mathsf{a}_{13}\mathsf{a}_{32} + \mathsf{a}_{11}\mathsf{a}_{12}\mathsf{a}_{33} - \mathsf{a}_{12}\mathsf{a}_{13}\mathsf{a}_{31} - \mathsf{a}_{11}\mathsf{a}_{13}\mathsf{a}_{32} + \mathsf{a}_{12}\mathsf{a}_{13}\mathsf{a}_{31}$ 

 $\mathsf{I} = \mathsf{a}_{11}\mathsf{a}_{12}\mathsf{a}_{33} - \mathsf{a}_{11}\mathsf{a}_{12}\mathsf{a}_{33} + \mathsf{a}_{11}\mathsf{a}_{13}\mathsf{a}_{32} - \mathsf{a}_{11}\mathsf{a}_{13}\mathsf{a}_{32} + \mathsf{a}_{12}\mathsf{a}_{13}\mathsf{a}_{31} - \mathsf{a}_{12}\mathsf{a}_{13}\mathsf{a}_{31}$ 

I=0

# 20. Question

```
Write the value of \begin{vmatrix} \sin 20^\circ & -\cos 20^\circ \\ \sin 70^\circ & \cos 70^\circ \end{vmatrix}.
```

# Answer

Let  $\Delta = \begin{vmatrix} \sin 20^\circ - \cos 20^\circ \\ \sin 70^\circ & \cos 70^\circ \end{vmatrix}$ 

Expanding along R<sub>1</sub>,

```
we get \Delta = sin20^{\circ}cos70^{\circ}-(-cos20^{\circ})sin70^{\circ}
```

```
= sin20°cos70°+cos20°sin70°
```

Since sin(A+B)= sinAcosB+cosAsinB

Hence,  $sin20^{\circ}cos70^{\circ}+cos20^{\circ}sin70^{\circ}=sin(20^{\circ}+70^{\circ})$ 

=sin(90°)

=1

Hence, ∆=1

# 21. Question

If A is a square matrix satisfying  $A^{T}A = I$ , write the value of |A|.

# Answer

Since A<sup>T</sup>A=I

Taking determinant both sides

 $|A^{T}A| = |I|$ 

Using |AB|=|A||B|,

 $|A^{\mathsf{T}}| = |A|$  and |I| = 1, we get

|A||A|=1

 $(|A|)^2 = 1$ 

Hence,  $|A| = \pm 1$ 

# 22. Question

If A and B are square matrices of the same order such that |A| = 3 and AB = I, then write the value of |B|.

# Answer

Given that |A|=3 and AB=I

Since AB=I

Taking determinant both sides

|AB| = |I|

Using |AB| = |A||B|, |A| = 3 and |I| = 1, we get

3|B|=1

Hence,  $|B| = \frac{1}{2}$ 

# 23. Question

A is skew-symmetric of order 3, write the value of  $|\mathsf{A}|.$ 

# Answer

Since A is a skew-symmetric matrix, Therefore

 $A^{T}=-A$ 

Taking determinant both sides

 $|A^{\mathsf{T}}| = |-A|$ 

Using  $|A^{T}| = |A|$  and  $|\lambda A| = \lambda^{m} |A|$  where m is the order of A

 $|A| = (-1)^3 |A|$ 

=-|A| or 2|A|=0

Hence, |A|=0

# 24. Question

If A is a square matrix of order 3 with determinant 4, then write the value of |-A|.

# Answer

Since  $|\lambda A| = \lambda^m |A|$ 

Given that  $\lambda$ =-1, m=3 and |A|=4, we get

 $|-A| = (-1)^3 \times 4 = -4$ 

# 25. Question

If A is a square matrix such that |A| = 2, write the value of  $|AA^{T}|$ .

# Answer

Given that |A|=2, we have to find  $|AA^{T}|$ 

Using |AB| = |A||B| and  $|A^T| = |A|$ , we get

 $|AA^{T}| = |A||A^{T}|$ 

=|A||A|

 $=2\times2$ 

=4

## 26. Question

	243	156	300	
Find the value of the determinant	81	52	100	
	-3	0	4	

## Answer

Let  $\Delta = \begin{vmatrix} 243 & 156 & 300 \\ 81 & 52 & 100 \\ -3 & 0 & 4 \end{vmatrix}$ 

Using the property that if the equimultiples of corresponding elements of other rows (or columns) are added to every element of any row (or column) of a determinant, then the value of determinant remains the same

Using row transformation,  $R_1 \rightarrow R_1 - 3R_2$ 

We get, 
$$\Delta = \begin{vmatrix} 243 - 81 \times 3 \ 156 - 52 \times 3 \ 300 - 100 \times 3 \\ 81 & 52 & 100 \\ -3 & 0 & 4 \end{vmatrix}$$
$$= \begin{vmatrix} 0 & 0 & 0 \\ 81 \ 52 \ 100 \\ -3 & 0 & 4 \end{vmatrix}$$

Using the property that if all elements of a row or column of a determinant are 0, the value of determinant is 0.

Hence  $\Delta = 0$ 

# 27. Question

Write the value of the determinant  $\begin{vmatrix} 2 & -3 & 5 \\ 4 & -6 & 10 \\ 6 & -9 & 15 \end{vmatrix}$ .

#### Answer

Let  $\Delta = \begin{vmatrix} 2 & -3 & 5 \\ 4 & -6 & 10 \\ 6 & -9 & 15 \end{vmatrix}$  $= \begin{vmatrix} 2 & -3 & 5 \\ 2 \times 2 & -3 \times 2 & 5 \times 2 \\ 2 \times 3 & -3 \times 3 & 5 \times 3 \end{vmatrix}$ 

Using the property that if each element of a row (or a column) of a determinant is multiplied by a constant k, then its value gets multiplied by k.

Taking out factor 2 from R<sub>2</sub> and 3 from R<sub>3</sub>,

We get,  $\Delta = 2 \times 3 \times \begin{vmatrix} 2 & -3 & 5 \\ 2 & -3 & 5 \\ 2 & -3 & 5 \end{vmatrix}$ 

Using the property that If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then the value of the determinant is zero.

Since  $R_1$ ,  $R_2$  and  $R_3$  are identical, therefore  $\Delta=0$ 

#### 28. Question

If the matrix  $\begin{bmatrix} 5x & 2\\ -10 & 1 \end{bmatrix}$  is singular, find the value of x.

## Answer

Let  $A = \begin{bmatrix} 5x & 2 \\ -10 & 1 \end{bmatrix}$ 

Then,  $|A| = \begin{vmatrix} 5x & 2 \\ -10 & 1 \end{vmatrix}$ 

=5x×1-2×-10 (Expanding along  $R_1$ )

|A| = 5x + 20

For A to be singular, |A|=0

Hence 5x+20=0 or x=-4

## 29. Question

If A is a square matrix of order n × n such that  $|A| = \lambda$ , then write the value of |-A|.

## Answer

Since  $|kA| = k^m |A|$ 

Given that k=-1, m=n and  $|A|=\lambda$ , we get

 $|-A|=(-1)^n \times \lambda$ 

Hence,  $|-A|=\lambda$  if n is even and  $|-A|=-\lambda$  if n is odd.

## 30. Question

Find the value of the determinant  $2^3$ 

## Answer

Let  $\Delta = \begin{vmatrix} 2^2 & 2^3 & 2^4 \\ 2^3 & 2^4 & 2^5 \\ 2^4 & 2^5 & 2^4 \end{vmatrix}$ 

Using the property that if each element of a row (or a column) of a determinant is multiplied by a constant k, then its value gets multiplied by k.

Taking out factor  $2^2$  from  $R_1$  and  $2^3$  from  $R_2$ ,

 $\Delta = 2^2 \times 2^3 \times \begin{vmatrix} 1 & 2 & 4 \\ 1 & 2 & 4 \\ 2^4 & 2^5 & 2^4 \end{vmatrix}$ 

Using the property that If any two rows (or columns) of a determinant are identical (all corresponding elements are same), then the value of the determinant is zero.

Since  $R_1$  and  $R_2$  are identical, therefore  $\Delta=0$ .

## 31. Question

If A and B are non-singular matrices of the same order, write whether AB is singular or non-singular.

## Answer

We are given that,

A = non-singular matrix

B = non-singular matrix

Order of A = Order of B

We need to find whether AB is singular or non-singular.

Let us recall the definition of non-singular matrix.

Non-singular matrix, also called regular matrix, is a square matrix that is not singular, i.e., one that has a matrix inverse.

We can say that, a square matrix A is non-singular matrix iff its determinant is non-zero, i.e.,  $|A| \neq 0$ .

While a singular matrix is a square matrix that doesn't have a matrix inverse. Also, the determinant is zero, i.e., |A| = 0.

So,

By definition,  $|A| \neq 0$  and  $|B| \neq 0$  since A and B are non-singular matrices.

Let,

Order of A = Order of  $B = n \times n$ 

 $\Rightarrow$  Matrices A and B can be multiplied

 $\Rightarrow A \times B = AB$ 

If we have matrices A and B of same order then we can say that,

|AB| = 0 iff either |A| or |B| = 0.

And it is clear that, |A|,  $|B| \neq 0$ .

 $\Rightarrow$  |AB|  $\neq$  0

And if  $|AB| \neq 0$ , then by definition AB is s non-singular matrix.

Thus, AB is a singular matrix.

## 32. Question

A matrix of order  $3 \times 3$  has determinant 2. What is the value of |A(3I)|, where I is the identity matrix of order  $3 \times 3$ .

## Answer

We are given that,

Order of a matrix =  $3 \times 3$ 

Determinant = 2

I = Identity matrix of order  $3 \times 3$ 

We need to find the value of |A(3I)|.

Let the given matrix be A.

Then, |A| = 2

Also, since I is an identity matrix, then

 $det \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$  $= 1((1 \times 1) - (0 \times 0)) - 0((0 \times 0) + (0 \times 1))$  $+0((0 \times 0) + (1 \times 0))$  $\Rightarrow \det \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} = 1(1-0) - 0 + 0$  $\Rightarrow \det \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} = 1$  $\Rightarrow$  Det (I) = 1 Or, ||| = 1Then, we can say 3(I) = 3 $\Rightarrow 3I = 3$ Thus, |A(3I)| = |A(3)| [:, 3I = 3]  $\Rightarrow |A(3I)| = |3A|$ By property of determinants, we know that  $|KA| = K^{n}|A|$ , if A is of n<sup>th</sup> order.  $\Rightarrow$  |A(3I)| = 3<sup>3</sup>|A| [ $\because$ , A has an order of 3 × 3  $\Rightarrow$  |3A| = 3<sup>3</sup> |A|]  $\Rightarrow$  |A(3I)| = 27 |A| Since, |A| = 2. Then,  $\Rightarrow$  |A(3I)| = 27  $\times$  2  $\Rightarrow |A(3I)| = 54$ 

Get More Learning Materials Here :

Thus, |A(3I)| = 54.

#### 33. Question

If A and B are square matrices of order 3 such that |A| = -1, |B| = 3, then find the value of |3AB|.

#### Answer

We are given that,

A and B are square matrices of order 3.

|A| = -1, |B| = 3

We need to find the value of |3AB|.

By property of determinant,

 $|KA| = K^n |A|$ 

If A is of n<sup>th</sup> order.

If order of  $A = 3 \times 3$ 

And order of  $B = 3 \times 3$ 

 $\Rightarrow$  Order of AB = 3  $\times$  3 [:, Number of columns in A = Number of rows in B]

We can write,

 $|3AB| = 3^3 |AB|$  [::, Order of AB = 3 × 3]

Now, |AB| = |A||B|.

 $\Rightarrow$  |3AB| = 27|A||B|

Putting |A| = -1 and |B| = 3, we get

 $\Rightarrow$  |3AB| = 27  $\times$  -1  $\times$  3

Thus, the value of |3AB| = -81.

## 34. Question

Write the value of  $\begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix}$ .

#### Answer

We need to find the value of

 $\begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix}$ 

Determinant of  $2 \times 2$  matrix is found as,

 $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$ 

So,

 $\begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix} = (a+ib)(a-ib) - (c+id)(-c+id)$ 

Rearranging,

$$\Rightarrow \begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix} = (a+ib)(a-ib) - (id+c)(id-c)$$

Using the algebraic identity,

# Get More Learning Materials Here : 📕

CLICK HERE

$$(x + y)(x - y) = x^{2} - y^{2}$$
  

$$\Rightarrow \begin{vmatrix} a + ib & c + id \\ -c + id & a - ib \end{vmatrix} = (a^{2} - (ib)^{2}) - ((id)^{2} - c^{2})$$
  

$$\Rightarrow \begin{vmatrix} a + ib & c + id \\ -c + id & a - ib \end{vmatrix} = (a^{2} - i^{2}b^{2}) - (i^{2}d^{2} - c^{2})$$
  

$$\Rightarrow \begin{vmatrix} a + ib & c + id \\ -c + id & a - ib \end{vmatrix} = a^{2} - i^{2}b^{2} - i^{2}d^{2} + c^{2}$$

Here, i is iota, an imaginary number.

Note that,

 $i^2 = -1$ 

So,

$$\Rightarrow \begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix} = a^2 - (-1)b^2 - (-1)d^2 + c^2$$
$$\Rightarrow \begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix} = a^2 + b^2 + d^2 + c^2$$

Thus,

 $\begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix} = a^2 + b^2 + c^2 + d^2$ 

#### 35. Question

	2	-3	5 ]	
Write the cofactor of $a_{12}$ in the matrix	6	0	4	•
	1	5	-7	

#### Answer

We need to find the cofactor of  $a_{12}$  in the matrix

 $\begin{bmatrix} 2 & -3 & 5 \\ 6 & 0 & 4 \\ 1 & 5 & -7 \end{bmatrix}$ 

A cofactor is the number you get when you remove the column and row of a designated element in a matrix, which is just a numerical grid in the form of a rectangle or a square. The cofactor is always preceded by a positive (+) or negative (-) sign, depending whether the element is in a + or - position. It is

**CLICK HERE** 

≫

🕀 www.studentbro.in

 $\begin{bmatrix} + & - & + \\ - & + & - \\ + & - & + \end{bmatrix}$ 

Let us recall how to find the cofactor of any element:

If we are given with,

a<sub>11</sub> a<sub>12</sub> a<sub>13</sub> a<sub>21</sub> a<sub>22</sub> a<sub>23</sub> a<sub>31</sub> a<sub>32</sub> a<sub>33</sub>

Cofactor of any element, say  $a_{11}$  is found by eliminating first row and first column.

```
Cofactor of a_{11} = \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix}
```

```
\Rightarrow \text{Cofactor of } a_{11} = a_{22} \times a_{33} - a_{23} \times a_{32}
```

The sign of cofactor of  $a_{11}$  is (+).

And, cofactor of any element, say  $a_{12}$  is found by eliminating first row and second column.

Cofactor of  $a_{12} = \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}$ 

 $\Rightarrow \text{Cofactor of } a_{12} = a_{21} \times a_{33} - a_{23} \times a_{31}$ 

The sign of cofactor of  $a_{12}$  is (-).

Similarly,

First know what the element at position  $a_{12}$  in the matrix is.

$$\ln \begin{bmatrix} 2 & -3 & 5 \\ 6 & 0 & 4 \\ 1 & 5 & -7 \end{bmatrix},$$

```
a<sub>12</sub> = -3
```

And as discussed above, the sign at  $a_{12}$  is (-).

For cofactor of -3, eliminate first row and second column in the matrix.

Cofactor of 
$$-3 = \begin{vmatrix} 6 & 4 \\ 1 & -7 \end{vmatrix}$$

 $\Rightarrow$  Cofactor of -3 = (6  $\times$  -7) - (4  $\times$  1)

 $\Rightarrow$  Cofactor of -3 = -42 - 4

 $\Rightarrow$  Cofactor of -3 = -46

Since, the sign of cofactor of -3 is (-), then

Cofactor of -3 = -(-46)

 $\Rightarrow$  Cofactor of -3 = 46

Thus, cofactor of -3 is 46.

## 36. Question

If  $\begin{bmatrix} 2x+5 & 3\\ 5x+2 & 9 \end{bmatrix} = 0$ , find x.

## Answer

```
9(2x + 5) - 3(5x+2) = 0

\Rightarrow 18x + 45 - 15x - 6 = 0

\Rightarrow 3x + 39 = 0

\Rightarrow 3x = -39

\Rightarrow x = -13
```

## 37. Question

Find the value of x from the following:  $\begin{bmatrix} x \\ 2 \end{bmatrix}$ 

$$\begin{vmatrix} 2\\ 2x \end{vmatrix} = 0.$$

# Answer

We are given that,

$$\begin{vmatrix} x & 2 \\ 2 & 2x \end{vmatrix} = 0$$

Get More Learning Materials Here : 📕

CLICK HERE

We need to find the value of x.

Determinant of  $2 \times 2$  matrix is found as,

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$$

So, determinant of the given matrix is found as,

$$\begin{vmatrix} x & 2 \\ 2 & 2x \end{vmatrix} = x \times 2x - 2 \times 2$$
$$\Rightarrow \begin{vmatrix} x & 2 \\ 2 & 2x \end{vmatrix} = 2x^2 - 4$$

According to the question, equate this to 0.

 $2x^2 - 4 = 0$ 

We need to solve the algebraic equation.

$$2x^{2} = 4$$
$$\Rightarrow x^{2} = \frac{4}{2}$$
$$\Rightarrow x^{2} = 2$$

Taking square root on both sides of the equation,

$$\Rightarrow \sqrt{x^2} = \pm \sqrt{2}$$

$$\Rightarrow x = \pm \sqrt{2}$$

Hence, the value of x is  $\pm \sqrt{2}$ .

# 38. Question

			4
Write the value of the determinant			
	6x	9x	12x

## Answer

We need to find the value of determinant,

2 3 4 5 6 8 6x 9x 12x

Determinant of  $3 \times 3$  matrices is found as,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}
\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31})
+ a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})
```

Similarly,

```
\begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 2. \det \begin{bmatrix} 6 & 8 \\ 9x & 12x \end{bmatrix} - 3. \det \begin{bmatrix} 5 & 8 \\ 6x & 12x \end{bmatrix} + 4. \det \begin{bmatrix} 5 & 6 \\ 6x & 9x \end{bmatrix}
\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 2(6 \times 12x - 8 \times 9x) - 3(5 \times 12x - 8 \times 6x) + 4(5 \times 9x - 6 \times 6x)
\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 2(72x - 72x) - 3(60x - 48x) + 4(45x - 36x)
\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 2(0) - 3(12x) + 4(9x)
\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 0 - 36x + 36x
\Rightarrow \begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 0
Thus, the value of \begin{vmatrix} 2 & 3 & 4 \\ 5 & 6 & 8 \\ 6x & 9x & 12x \end{vmatrix} = 0.
```

#### **39.** Question

If |A| = 2, where A is 2 × 2 matrix, find |adj A|.

#### Answer

We are given that,

Order of matrix  $A = 2 \times 2$ 

|A| = 2

We need to find the |adj A|.

Let us understand what adjoint of a matrix is.

Let  $A = [a_{ij}]$  be a square matrix of order  $n \times n$ . Then, the adjoint of the matrix A is transpose of the cofactor of matrix A.

The relationship between adjoint of matrix and determinant of matrix is given as,

$$|adj A| = |A|^{n-1}$$
  
Where, n = order of the matrix  
Putting |A| = 2 in the above equation,  
⇒ |adj A| = (2)^{n-1} ...(i)  
Here, order of matrix A = 2  
∴, n = 2  
Putting n = 2 in equation (i), we get  
⇒ |adj A| = (2)^{2-1}  
⇒ |adj A| = (2)^1  
⇒ |adj A| = 2

Thus, the |adj A| is 2.

#### 40. Question

For what is the value of the determinant  $\begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix}$ ?

#### Answer

We need to find the value of determinant,

0 2 0 2 3 4 4 5 6

Determinant of  $3 \times 3$  matrices is found as,

```
\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}
\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}
= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31})
+ a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})
```

Similarly,

$$\begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 0. \det \begin{bmatrix} 3 & 4 \\ 5 & 6 \end{bmatrix} - 2. \det \begin{bmatrix} 2 & 4 \\ 4 & 6 \end{bmatrix} - 0. \det \begin{bmatrix} 2 & 3 \\ 4 & 5 \end{bmatrix}$$

$$\Rightarrow \begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 0(3 \times 6 - 4 \times 5) - 2(2 \times 6 - 4 \times 4) - 0(2 \times 5 - 3 \times 4)$$

$$\Rightarrow \begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 0(18 - 20) - 2(12 - 16) - 0(10 - 12)$$

$$\Rightarrow \begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 0(-2) - 2(-4) - 0(-2)$$

$$\Rightarrow \begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 0 + 8 + 0$$

$$\Rightarrow \begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 0 + 8 + 0$$

$$\Rightarrow \begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 8$$
Thus, the value of 
$$\begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 8$$
Thus, the value of 
$$\begin{vmatrix} 0 & 2 & 0 \\ 2 & 3 & 4 \\ 4 & 5 & 6 \end{vmatrix} = 8$$
Alt. Question
For what value of x is the matrix 
$$\begin{bmatrix} 6 - x & 4 \\ 3 - x & 1 \end{bmatrix}$$
 singular?
Answer

Get More Learning Materials Here :

CLICK HERE

We are given that,

$$\begin{bmatrix} 6-x & 4\\ 3-x & 1 \end{bmatrix}$$
 is singular matrix.

We need to find the value of x.

Let us recall the definition of singular matrix.

A singular matrix is a square matrix that doesn't have a matrix inverse. A matrix 'A' is singular iff its determinant is zero, i.e., |A| = 0.

Hence, we just need to find the determinant of the given matrix and equate it to zero.

Determinant of  $2 \times 2$  matrix is found as,

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$$
  
So,  
$$\begin{vmatrix} 6 - x & 4 \\ 3 - x & 1 \end{vmatrix} = (6 - x) \times 1 - 4 \times (3 - x)$$
$$\Rightarrow \begin{vmatrix} 6 - x & 4 \\ 3 - x & 1 \end{vmatrix} = (6 - x) - (12 - 4x)$$
$$\Rightarrow \begin{vmatrix} 6 - x & 4 \\ 3 - x & 1 \end{vmatrix} = 6 - x - 12 + 4x$$
$$\Rightarrow \begin{vmatrix} 6 - x & 4 \\ 3 - x & 1 \end{vmatrix} = 4x - x - 12 + 6$$
$$\Rightarrow \begin{vmatrix} 6 - x & 4 \\ 3 - x & 1 \end{vmatrix} = 3x - 6$$

Now, equate this to 0.

That is,

 $\begin{vmatrix} 6 - x & 4 \\ 3 - x & 1 \end{vmatrix} = 0$   $\Rightarrow 3x - 6 = 0$   $\Rightarrow 3x = 6$   $\Rightarrow x = \frac{6}{3}$  $\Rightarrow x = 2$ 

Thus, the value of x = 2 for which the matrix is singular.

### 42. Question

A matrix A of order  $3 \times 3$  is such that |A| = 4. Find the value of |2A|.

### Answer

We are given that,

Order of matrix A = 3

|A| = 4

We need to find the value of  $|\mathsf{2A}|.$ 

By property of determinant of matrix,

 $|KA| = K^n |A|$ 

Where, order of the matrix A is n.

Similarly,

 $|2A| = 2^{3}|A|$ 

[:, Order of matrix A = 3]

 $\Rightarrow |2A| = 8|A|$ 

Substituting the value of |A| in the above equation,

 $\Rightarrow |2A| = 8 \times 4$ 

⇒ |2A| = 32

Thus, the value of |2A| is 32.

## 43. Question

Evaluate:  $\begin{vmatrix} \cos 15^\circ & \sin 15^\circ \\ \sin 75^\circ & \cos 75^\circ \end{vmatrix}$ 

## Answer

We need to evaluate the matrix:

cos 15° sin 15° sin 75° cos 75°

Determinant of 2  $\times$  2 matrix is found as,

 $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$ 

So,

 $\begin{vmatrix} \cos 15^{\circ} & \sin 15^{\circ} \\ \sin 75^{\circ} & \cos 75^{\circ} \end{vmatrix} = \cos 15^{\circ} \times \cos 75^{\circ} - \sin 15^{\circ} \times \sin 75^{\circ}$ 

Using the trigonometric identity,

 $\cos (A + B) = \cos A \cos B - \sin A \sin B$ 

Replace A by 15° and B by 75°.

 $\cos (15^{\circ} + 75^{\circ}) = \cos 15^{\circ} \cos 75^{\circ} - \sin 15^{\circ} \cos 75^{\circ}$ 

⇒ cos 90° = cos 15° cos 75° - sin 15° cos 75°

So, substituting it, we get

```
\Rightarrow \begin{vmatrix} \cos 15^{\circ} & \sin 15^{\circ} \\ \sin 75^{\circ} & \cos 75^{\circ} \end{vmatrix} = \cos 90^{\circ}
```

Using the trigonometric identity,

```
\cos 90^\circ = 0
```

 $\Rightarrow \begin{vmatrix} \cos 15^{\circ} & \sin 15^{\circ} \\ \sin 75^{\circ} & \cos 75^{\circ} \end{vmatrix} = 0$ 

Thus, the value of  $\begin{vmatrix} \cos 15^{\circ} & \sin 15^{\circ} \\ \sin 75^{\circ} & \cos 75^{\circ} \end{vmatrix} = 0.$ 

# 44. Question

If  $A = \begin{bmatrix} 5 & 3 & 8 \\ 2 & 0 & 1 \\ 1 & 2 & 3 \end{bmatrix}$ . Write the cofactor of the element  $a_{32}$ .

CLICK HERE

🕀 www.studentbro.in

### Answer

We are given that,

```
\mathbf{A} = \begin{bmatrix} 5 & 3 & 8 \\ 2 & 0 & 1 \\ 1 & 2 & 3 \end{bmatrix}
```

We need to find the cofactor of the element  $a_{32}$ .

A cofactor is the number you get when you remove the column and row of a designated element in a matrix, which is just a numerical grid in the form of a rectangle or a square. The cofactor is always preceded by a positive (+) or negative (-) sign, depending whether the element is in a + or - position. It is

 $\begin{bmatrix} + & - & + \\ - & + & - \\ + & - & + \end{bmatrix}$ 

Let us recall how to find the cofactor of any element:

If we are given with,

a<sub>11</sub> a<sub>12</sub> a<sub>13</sub> a<sub>21</sub> a<sub>22</sub> a<sub>23</sub> a<sub>31</sub> a<sub>32</sub> a<sub>33</sub>

Cofactor of any element, say a<sub>11</sub> is found by eliminating first row and first column.

```
Cofactor of a_{11} = \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix}
```

```
\Rightarrow \text{Cofactor of } a_{11} = a_{22} \times a_{33} - a_{23} \times a_{32}
```

```
The sign of cofactor of a_{11} is (+).
```

And, cofactor of any element, say  $a_{12}$  is found by eliminating first row and second column.

```
Cofactor of a_{12} = \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}
```

```
\Rightarrow Cofactor of a_{12} = a_{21} \times a_{33} - a_{23} \times a_{31}
```

The sign of cofactor of  $a_{12}$  is (-).

So,

```
In matrix, A = \begin{bmatrix} 5 & 3 & 8 \\ 2 & 0 & 1 \\ 1 & 2 & 3 \end{bmatrix}.
```

Element at  $a_{32} = 2$ 

We need to find the cofactor of 2 at  $a_{32}$ .

And as discussed above, the sign at  $a_{32}$  is (-).

For cofactor of a<sub>32</sub>, eliminate third row and second column in the matrix.

```
Cofactor of a_{32} = \begin{vmatrix} 5 & 8 \\ 2 & 1 \end{vmatrix}

\Rightarrow Cofactor of a_{32} = 5 \times 1 - 8 \times 2

\Rightarrow Cofactor of a_{32} = 5 - 16

\Rightarrow Cofactor of a_{32} = -11

Since, the sign of cofactor of a_{32} is (-), then

Cofactor of a_{32} = -(-11)

\Rightarrow Cofactor of a_{32} = 11
```

Thus, cofactor of  $a_{32}$  is 11.

## 45. Question

If 
$$\begin{vmatrix} x+1 & x-1 \\ x-3 & x+2 \end{vmatrix} = \begin{vmatrix} 4 & -1 \\ 1 & 3 \end{vmatrix}$$
, then write the value of x.

## Answer

We are given that,

$$\begin{vmatrix} x+1 & x-1 \\ x-3 & x+2 \end{vmatrix} = \begin{vmatrix} 4 & -1 \\ 1 & 3 \end{vmatrix}$$

We need to find the value of x.

Determinant of  $2 \times 2$  matrix is found as,

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$$

Let us take left hand side (LHS) of the given matrix equation.

LHS = 
$$\begin{vmatrix} x + 1 & x - 1 \\ x - 3 & x + 2 \end{vmatrix}$$
  
⇒ LHS =  $(x + 1)(x + 2) - (x - 1)(x - 3)$   
⇒ LHS =  $(x^2 + x + 2x + 2) - (x^2 - x - 3x + 3)$   
⇒ LHS =  $(x^2 + 3x + 2) - (x^2 - 4x + 3)$   
⇒ LHS =  $x^2 + 3x + 2 - x^2 + 4x - 3$   
⇒ LHS =  $x^2 - x^2 + 3x + 4x + 2 - 3$   
⇒ LHS =  $7x - 1$ 

Let us take right hand side (RHS) of the given matrix equation.

$$RHS = \begin{vmatrix} 4 & -1 \\ 1 & 3 \end{vmatrix}$$
  

$$\Rightarrow RHS = 4 \times 3 - (-1) \times 1$$
  

$$\Rightarrow RHS = 12 + 1$$
  

$$\Rightarrow RHS = 13$$
  
Now,  

$$LHS = RHS$$
  

$$\Rightarrow 7x - 1 = 13$$
  

$$\Rightarrow 7x = 13 + 1$$
  

$$\Rightarrow 7x = 14$$
  

$$\Rightarrow x = \frac{14}{7}$$
  

$$\Rightarrow x = 2$$
  
Thus, the value of x is 2.  
46. Question

If  $\begin{vmatrix} 2x & x+3 \\ 2(x+1) & x+1 \end{vmatrix} = \begin{vmatrix} 1 & 5 \\ 3 & 3 \end{vmatrix}$ , then write the value of x.

Get More Learning Materials Here : 📕

### Answer

We are given that,

 $\begin{vmatrix} 2x & x+3 \\ 2(x+1) & x+1 \end{vmatrix} = \begin{vmatrix} 1 & 5 \\ 3 & 3 \end{vmatrix}$ 

We need to find the value of x.

Determinant of  $2 \times 2$  matrix is found as,

 $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$ 

Let us take left hand side (LHS) of the given matrix equation.

```
LHS = \begin{vmatrix} 2x & x+3 \\ 2(x+1) & x+1 \end{vmatrix}

⇒ LHS = 2x(x + 1) - (x + 3)(2(x + 1))

⇒ LHS = (2x<sup>2</sup> + 2x) - (x + 3)(2x + 2)

⇒ LHS = (2x<sup>2</sup> + 2x) - (2x<sup>2</sup> + 2x + 6x + 6)

⇒ LHS = (2x<sup>2</sup> + 2x) - (2x<sup>2</sup> + 8x + 6)

⇒ LHS = 2x<sup>2</sup> + 2x - 2x<sup>2</sup> - 8x - 6

⇒ LHS = 2x<sup>2</sup> - 2x<sup>2</sup> + 2x - 8x - 6

⇒ LHS = -6x - 6
```

Let us take right hand side (RHS) of the given matrix equation.

```
RHS = \begin{vmatrix} 1 & 5 \\ 3 & 3 \end{vmatrix}

\Rightarrow RHS = 1 \times 3 - 5 \times 3

\Rightarrow RHS = 3 - 15

\Rightarrow RHS = -12

Now,

LHS = RHS

\Rightarrow -6x - 6 = -12

\Rightarrow -6x = -12 + 6

\Rightarrow -6x = -6

\Rightarrow x = \frac{-6}{-6}

\Rightarrow x = 1
```

Thus, the value of x is 1.

## 47. Question

If 
$$\begin{vmatrix} 3x & 7 \\ -2 & 4 \end{vmatrix} = \begin{vmatrix} 8 & 7 \\ 6 & 4 \end{vmatrix}$$
, find the value of x.

#### Answer

We are given that,

 $\begin{vmatrix} 3x & 7 \\ -2 & 4 \end{vmatrix} = \begin{vmatrix} 8 & 7 \\ 6 & 4 \end{vmatrix}$ 

We need to find the value of x.

Determinant of  $2 \times 2$  matrix is found as,

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$$

Let us take left hand side (LHS) of the given matrix equation.

$$LHS = \begin{vmatrix} 3x & 7 \\ -2 & 4 \end{vmatrix}$$
$$\Rightarrow LHS = 3x \times 4 - 7 \times (-2)$$
$$\Rightarrow LHS = 12x - (-14)$$
$$\Rightarrow LHS = 12x + 14$$

Let us take right hand side (RHS) of the given matrix equation.

```
RHS = \begin{vmatrix} 8 & 7 \\ 6 & 4 \end{vmatrix}

\Rightarrow RHS = 8 \times 4 - 7 \times 6

\Rightarrow RHS = 32 - 42

\Rightarrow RHS = -10

Now,

LHS = RHS

\Rightarrow 12x + 14 = -10

\Rightarrow 12x = -10 - 14

\Rightarrow 12x = -24

\Rightarrow x = \frac{-24}{12}

\Rightarrow x = -2
```

Thus, the value of x is -2.

# 48. Question

If 
$$\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$$
, write the value of x.

# Answer

We are given that,

 $\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$ 

We need to find the value of x.

Determinant of 2  $\times$  2 matrix is found as,

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$$

Let us take left hand side (LHS) of the given matrix equation.

 $LHS = \begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix}$ 

```
\Rightarrow LHS = 2x \times x - 5 \times 8
```

 $\Rightarrow$  LHS = 2x<sup>2</sup> - 40

Let us take right hand side (RHS) of the given matrix equation.

```
RHS = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}

\Rightarrow RHS = 6 \times 3 - (-2) \times 7

\Rightarrow RHS = 18 - (-14)

\Rightarrow RHS = 18 + 14

\Rightarrow RHS = 32

Now,

LHS = RHS

\Rightarrow 2x^{2} - 40 = 32

\Rightarrow 2x^{2} = 32 + 40

\Rightarrow 2x^{2} = 72

\Rightarrow x^{2} = \frac{72}{2}

\Rightarrow x^{2} = 36

\Rightarrow x = \pm\sqrt{36}

\Rightarrow x = \pm6
```

Thus, the value of x is  $\pm 6$ .

# 49. Question

If A is a 3  $\times$  3 matrix,  $|A| \neq 0$  and |3A| = k|A| then write value of k.

### Answer

We are given that,

Order of matrix = 3

|A| ≠ 0

|3A| = k|A|

We need to find the value of k.

In order to find k, we need to solve |3A|.

Using property of determinants,

 $|\mathbf{k}\mathbf{A}| = \mathbf{k}^{n}|\mathbf{A}|$ 

Where, order of A is  $n \times n$ .

Similarly,

 $|3A| = 3^{3}|A|$ 

[∵, order of A is 3]

⇒ |3A| = 27|A| ...(i)

As, according to the question

|3A| = k|A|

Using (i),

 $\Rightarrow 27|A| = k|A|$ 

Comparing the left hand side and right hand side, we get

k = 27

Thus, the value of k is 27.

# 50. Question

Write the value of the determinant  $\begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix}$ .

# Answer

We need to find the determinant,

 $\begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix}$ 

Determinant of 2  $\times$  2 matrix is found as,

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$$

So,

$$\begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix} = p \times p - (p+1)(p-1)$$

Using the algebraic identity,

$$(a + b)(a - b) = a^{2} - b^{2}$$

$$\Rightarrow \begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix} = p^{2} - (p^{2} - 1)$$

$$\Rightarrow \begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix} = p^{2} - p^{2} + 1$$

$$\Rightarrow \begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix} = 1$$

Thus, the value of  $\begin{vmatrix} p & p+1 \\ p-1 & p \end{vmatrix} = 1.$ 

# 51. Question

Write the value of the determinant 
$$\begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix}$$

**CLICK HERE** 

>>

# Answer

We need to find the value of determinant

$$\begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix}$$

Determinant of  $3 \times 3$  matrices is found as,

Get More Learning Materials Here : 📕

R www.studentbro.in

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$
  
=  $a_{11}.det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}.det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}.det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}$   
 $\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$   
=  $a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31}) + a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})$ 

So,

$$\begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix}$$
  
=  $(x + y).det \begin{bmatrix} x & y \\ -3 & -3 \end{bmatrix} - (y + z).det \begin{bmatrix} z & y \\ -3 & -3 \end{bmatrix}$   
+  $(z + x).det \begin{bmatrix} z & x \\ -3 & -3 \end{bmatrix}$   
$$\Rightarrow \begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix}$$
  
=  $(x + y).(x \times (-3) - y \times (-3))$   
-  $(y + z).(z \times (-3) - y \times (-3)) + (z + x).(z \times (-3) - x \times (-3))$ 

$$\Rightarrow \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = (x+y)(-3x+3y) - (y+z)(-3z+3y) + (z+x)(-3z+3x) \Rightarrow \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 3(x+y)(-x+y) - 3(y+z)(-z+y) + 3(z+x)(-z+x)$$

Re-arranging the equation,

$$\Rightarrow \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \\ & = 3(y+x)(y-x) - 3(y+z)(y-z) + 3(x+z)(x-z) \\ \Rightarrow \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 3[(y+x)(y-x) - (y+z)(y-z) + (x+z)(x-z)]$$

Using the algebraic identity,

$$(a + b)(a - b) = a^{2} - b^{2}$$

$$\Rightarrow \begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 3[(y^{2} - x^{2}) - (y^{2} - z^{2}) + (x^{2} - z^{2})]$$

$$\Rightarrow \begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 3(y^{2} - x^{2} - y^{2} + z^{2} + x^{2} - z^{2})$$

$$\Rightarrow \begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 3(x^{2} - x^{2} + y^{2} - y^{2} + z^{2} - z^{2})$$

$$\Rightarrow \begin{vmatrix} x + y & y + z & z + x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 3(0 + 0 + 0)$$

$$\Rightarrow \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix} = 0$$
  
Thus, the value of 
$$\begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ -3 & -3 & -3 \end{vmatrix}$$
 is 0.

### 52. Question

If  $A = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$ , then for any natural number, find the value of  $Det(A^n)$ .

### Answer

We are given that,

 $\mathbf{A} = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$ 

We need to find the  $det(A^n)$ .

To find det(A<sup>n</sup>),

First we need to find  $A^n$ , and then take determinant of  $A^n$ .

Let us find  $A^2$ .

```
A^2 = A.A
```

```
\Rightarrow A^{2} = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}
```

Let,

 $\begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} = \begin{bmatrix} z_{11} & z_{12} \\ z_{21} & z_{22} \end{bmatrix}$ 

For z<sub>11</sub>: Dot multiply the first row of the first matrix and first column of the second matrix, then sum up.

That is,

 $(\cos \theta, \sin \theta).(\cos \theta, -\sin \theta) = \cos \theta \times \cos \theta + \sin \theta \times (-\sin \theta)$ 

```
\Rightarrow (\cos \theta, \sin \theta).(\cos \theta, -\sin \theta) = \cos^2 \theta - \sin^2 \theta
```

By algebraic identity,

 $\cos 2\theta = \cos^2 \theta - \sin^2 \theta$ 

 $\Rightarrow (\cos \theta, \sin \theta).(\cos \theta, -\sin \theta) = \cos 2\theta$ 

 $\Rightarrow \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} = \begin{bmatrix} \cos2\theta & z_{12} \\ z_{21} & z_{22} \end{bmatrix}$ 

For  $z_{12}$ : Dot multiply the first row of the first matrix and second column of the second matrix, then sum up.

That is,

 $(\cos \theta, \sin \theta)(\sin \theta, \cos \theta) = \cos \theta \times \sin \theta + \sin \theta \times \cos \theta$ 

 $\Rightarrow (\cos \theta, \sin \theta)(\sin \theta, \cos \theta) = \sin \theta \cos \theta + \sin \theta \cos \theta$ 

 $\Rightarrow (\cos \theta, \sin \theta)(\sin \theta, \cos \theta) = 2 \sin \theta \cos \theta$ 

By algebraic identity,

 $\sin 2\theta = 2 \sin \theta \cos \theta$ 

 $\Rightarrow (\cos \theta, \sin \theta)(\sin \theta, \cos \theta) = \sin 2\theta$ 

 $\Rightarrow \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} = \begin{bmatrix} \cos 2\theta & \sin 2\theta \\ z_{21} & z_{22} \end{bmatrix}$ Similarly,  $\Rightarrow \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \\ = \begin{bmatrix} \cos2\theta & \sin2\theta \\ (-\sin\theta \times \cos\theta) + (\cos\theta \times -\sin\theta) & (-\sin\theta \times \sin\theta) + (\cos\theta \times \cos\theta) \end{bmatrix}$  $\Rightarrow \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \\ = \begin{bmatrix} \cos2\theta & \sin2\theta \\ -\sin\theta\cos\theta - \sin\theta\cos\theta & -\sin^2\theta + \cos^2\theta \end{bmatrix}$  $\Rightarrow \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} = \begin{bmatrix} \cos2\theta & \sin2\theta \\ -2\sin\theta\cos\theta & \cos2\theta \end{bmatrix}$  $\Rightarrow \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} = \begin{bmatrix} \cos2\theta & \sin2\theta \\ -\sin2\theta & \cos2\theta \end{bmatrix}$  $\Rightarrow A^{2} = \begin{bmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{bmatrix}$ If  $A = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$  and  $A^2 = \begin{bmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{bmatrix}$ , then  $A^{n} = \begin{bmatrix} \cos n\theta & \sin n\theta \\ -\sin n\theta & \cos n\theta \end{bmatrix}$ Now, taking determinant of A<sup>n</sup>,  $\text{Det}(A^n) = \begin{vmatrix} \cos n\theta & \sin n\theta \\ -\sin n\theta & \cos n\theta \end{vmatrix}$ Determinant of  $2 \times 2$  matrix is found as,  $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$ So,  $Det(A^n) = \cos n\theta \times \cos n\theta - \sin n\theta \times (-\sin n\theta)$  $\Rightarrow$  Det(A<sup>n</sup>) = cos<sup>2</sup> n $\theta$  + sin<sup>2</sup> n $\theta$ Using the algebraic identity,  $\sin^2 A + \cos^2 A = 1$ 

 $\Rightarrow \text{Det}(A^n) = 1$ 

Thus, Det(A<sup>n</sup>) is 1.

### 53. Question

	1	1	1	
Find the maximum value of	1	$1+\sin\theta$	1	
	1	2	$1 + \cos \theta$	

# Answer

We need to find the maximum value of

Let us find the determinant,

 $\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix}$ 

Determinant of  $3 \times 3$  matrices is found as,

a<sub>11</sub> a<sub>12</sub> a<sub>13</sub> a<sub>21</sub> a<sub>22</sub> a<sub>23</sub> a<sub>31</sub> a<sub>32</sub> a<sub>33</sub>  $= a_{11} \det \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12} \det \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13} \det \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}$  $\Rightarrow \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$  $= a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31})$  $+a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31})$ So,  $\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix}$ = 1. det  $\begin{bmatrix} 1 + \sin \theta & 1 \\ 2 & 1 + \cos \theta \end{bmatrix}$  - 1. det  $\begin{bmatrix} 1 & 1 \\ 1 & 1 + \cos \theta \end{bmatrix}$ + 1. det  $\begin{bmatrix} 1 & 1 + \sin \theta \\ 1 & 2 \end{bmatrix}$  $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \end{vmatrix}$  $2 1 + \cos\theta$  $= [(1 + \sin \theta)(1 + \cos \theta) - 1 \times 2] - [1(1 + \cos \theta) - 1]$  $+ [1 \times 2 - (1 + \sin \theta)]$  $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix}$  $= [1 + \cos \theta + \sin \theta + \sin \theta \cos \theta - 2] - [1 + \cos \theta - 1]$  $+ [2 - 1 - \sin \theta]$  $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix}$  $= 1 + \cos\theta + \sin\theta + \sin\theta \cos\theta - 2 - \cos\theta + 2 - 1 - \sin\theta$  $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 0 & 1 \end{vmatrix}$  $2 1 + \cos\theta$  $= 1 - 2 + 2 - 1 + \sin \theta - \sin \theta + \cos \theta - \cos \theta + \sin \theta \cos \theta$  $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \sin \theta \end{vmatrix} = \sin \theta \cos \theta$ 2

Multiply and divide by 2 on right hand side,

 $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix} = \frac{2}{2} \sin \theta \cos \theta$  $\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix} = \frac{\sin 2\theta}{2}$ 

[:, By trigonometric identity,  $\sin 2\theta = 2 \sin \theta \cos \theta$ ]

We need to find the maximum value of  $\frac{\sin 2\theta}{2}$ .

Get More Learning Materials Here : 📒

CLICK HERE

We know the range of sine function.

 $-1 \leq \sin A \leq 1$ 

Or,

 $-1 \le \sin 2\theta \le 1$ 

 $\therefore$ , maximum value of sin 2 $\theta$  is 1.

⇒ maximum value of  $\frac{\sin 2\theta}{2} = 1/2$ 

Thus, maximum value of

 $\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 & 2 & 1 + \cos \theta \end{vmatrix} = \frac{1}{2}$ 

### 54. Question

If  $x \in N$  and  $\begin{vmatrix} x+3 & -2 \\ -3x & 2x \end{vmatrix} = 8$ , then find the value of x.

## Answer

We are given that,

 $\begin{vmatrix} x+3 & -2 \\ -3x & 2x \end{vmatrix} = 8$ 

$$x \in N$$

We need to find the value of x.

Determinant of  $2 \times 2$  matrix is found as,

 $\begin{vmatrix} a & b \\ c & d \end{vmatrix} = a \times d - b \times c$ 

# So, take

$$\begin{vmatrix} x+3 & -2 \\ -3x & 2x \end{vmatrix} = [(x+3) \times 2x] - [(-2) \times (-3x)]$$
  

$$\Rightarrow \begin{vmatrix} x+3 & -2 \\ -3x & 2x \end{vmatrix} = 2x^2 + 6x - 6x$$
  

$$\Rightarrow \begin{vmatrix} x+3 & -2 \\ -3x & 2x \end{vmatrix} = 2x^2$$
  
Since,

$$\begin{vmatrix} x+3 & -2 \\ -3x & 2x \end{vmatrix} = 8$$
  

$$\Rightarrow 2x^{2} = 8$$
  

$$\Rightarrow x^{2} = \frac{8}{2}$$
  

$$\Rightarrow x^{2} = 4$$
  

$$\Rightarrow x = \pm \sqrt{4}$$
  

$$\Rightarrow x = \pm 2$$
  
Since,  $x \in N$   
-2 is not a natural number.

Get More Learning Materials Here :

CLICK HERE >>

Thus, the value of x is 2.

### 55. Question

If  $\begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix} = 8$ , write the value of x.

### Answer

We are given that,

 $\begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = 8$ 

We need to find the value of x.

Determinant of  $3 \times 3$  matrices is found as,

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} det \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} det \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{32} \end{vmatrix} + a_{13} det \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{22} & a_{23} \\ a_{31} & a_{22} & a_{23} \end{vmatrix} = a_{11}(a_{22} \times a_{33} - a_{23} \times a_{32}) - a_{12}(a_{21} \times a_{33} - a_{23} \times a_{31}) + a_{13}(a_{21} \times a_{32} - a_{22} \times a_{31}) \end{vmatrix}$$
So,
$$\begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = x. det \begin{bmatrix} -x & 1 \\ 1 & x \end{bmatrix} - \sin\theta . det \begin{bmatrix} -\sin\theta & 1 \\ \cos\theta & x \end{bmatrix} + \cos\theta . det \begin{bmatrix} -\sin\theta & -x \\ \cos\theta & 1 \end{bmatrix}$$

$$\Rightarrow \begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = x. det \begin{bmatrix} -\sin\theta & -x \\ \cos\theta & 1 \end{bmatrix}$$

$$\Rightarrow \begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = x. [-x \times x - 1] - \sin\theta . [-\sin\theta \times x - \cos\theta] + \cos\theta . [-\sin\theta + x \cos\theta] + \cos\theta . [-\sin\theta - (-x) \times \cos\theta]$$

$$\Rightarrow \begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = x[-x^2 - 1] - \sin\theta [-x \sin\theta - \cos\theta] + \cos\theta [-\sin\theta + x \cos\theta]$$

$$\Rightarrow \begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = -x^2 - x + x \sin^2\theta + \sin\theta \cos\theta - \sin\theta \cos\theta + x \cos^2\theta$$

$$\Rightarrow \begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = -x^2 - x + x (\sin^2\theta + \cos^2\theta)$$

Using trigonometric identity,

```
\sin^{2} \theta + \cos^{2} \theta = 1
\Rightarrow \begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix} = -x^{3} - x + x
\Rightarrow \begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix} = -x^{3}
```

Since,

```
\begin{vmatrix} x & \sin\theta & \cos\theta \\ -\sin\theta & -x & 1 \\ \cos\theta & 1 & x \end{vmatrix} = 8\Rightarrow -x^{3} = 8\Rightarrow x^{3} = -8
```

```
\Rightarrow x^3 = -2 \times -2 \times -2
```

Taking cube root on both sides,

$$\Rightarrow \sqrt[3]{x^3} = \sqrt[3]{-2 \times -2 \times -2}$$

Thus, the value of x is -2.

### 56. Question

If A is a 3 × 3 matrix, then what will be the value of k if  $Det(A^1) = (Det A)^k$ ?

### Answer

We are given that,

Order of matrix =  $3 \times 3$ 

 $Det(A^{-1}) = (Det A)^k$ 

An n-by-n square matrix A is called invertible if there exists an n-by-n square matrix B such that where  $I_h$  denotes the n-by-n identity matrix and the multiplication used is ordinary matrix multiplication.

We know that,

If A and B are square matrices of same order, then

Det (AB) = Det (A).Det (B)

Since, A is an invertible matrix, this means that, A has an inverse called  $A^{-1}$ .

Then, if A and A<sup>-1</sup> are inverse matrices, then

 $Det (AA^{-1}) = Det (A).Det (A^{-1})$ 

By property of inverse matrices,

 $AA^{-1} = I$ 

 $\therefore$ , Det (I) = Det (A).Det (A<sup>-1</sup>)

Since, Det(I) = 1

 $\Rightarrow 1 = \text{Det}(A).\text{Det}(A^{-1})$ 

$$\Rightarrow \text{Det}(A^{-1}) = \frac{1}{\text{Det}(A)}$$
$$\Rightarrow \text{Det}(A^{-1}) = \text{Det}(A)^{-1}$$
Since, according to question,  
$$\text{Det}(A^{-1}) = (\text{Det} A)^{k}$$
$$\Rightarrow k = -1$$

Thus, the value of k is -1.
