18. Binomial Theorem

Very Short Answer

1. Question

Write the number of terms in the expansion of $\left(2+\sqrt{3}x\right)^{10}+\left(2-\sqrt{3}x\right)^{10}$.

Answer

Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{k} a^{n-k}$$

$$(2 + \sqrt{3}x)^{10} = \sum_{k=0}^{10} {10 \choose k} 2^{k} (\sqrt{3}x)^{10-k}$$

$$= {10 \choose 0} 2^{0} (\sqrt{3}x)^{10} + {10 \choose 1} 2^{1} (\sqrt{3}x)^{10-1} + \dots + {10 \choose 9} 2^{9} (\sqrt{3}x)^{10-9} + {10 \choose 10} 2^{10} (\sqrt{3}x)^{10-10} (1)$$

$$(2 - \sqrt{3}x)^{10} = \sum_{k=0}^{10} {10 \choose k} 2^{k} (-\sqrt{3}x)^{10-k}$$

$$= {10 \choose 0} 2^{0} (-\sqrt{3}x)^{10} + {10 \choose 1} 2^{1} (-\sqrt{3}x)^{10-1} + \dots + {10 \choose 9} 2^{9} (-\sqrt{3}x)^{10-9} + {10 \choose 10} 2^{10} (\sqrt{3}x)^{10-10} (1)$$

$$(2 - \sqrt{3}x)^{10} = \sum_{k=0}^{10} {10 \choose k} 2^{k} (-\sqrt{3}x)^{10-k}$$

$$= {10 \choose 0} 2^{0} (-\sqrt{3}x)^{10} + {10 \choose 1} 2^{1} (-\sqrt{3}x)^{10-1} + \dots + {10 \choose 9} 2^{9} (-\sqrt{3}x)^{10-9} + {10 \choose 9} 2^{10} (-\sqrt{3}x)^{10-10} (1)$$

Add both equations;

$$\begin{pmatrix} 2+\sqrt{3}x \end{pmatrix}^{10} + \begin{pmatrix} 2-\sqrt{3}x \end{pmatrix}^{10}$$

$$= \begin{pmatrix} 10 \\ 0 \end{pmatrix} 2^0 (\sqrt{3x})^{10} + \begin{pmatrix} 10 \\ 1 \end{pmatrix} 2^1 (\sqrt{3x})^{10-1} + \dots + \begin{pmatrix} 10 \\ 9 \end{pmatrix} 2^9 (\sqrt{3x})^{10-9}$$

$$+ \begin{pmatrix} 10 \\ 10 \end{pmatrix} 2^{10} (\sqrt{3x})^{10-10} +$$

$$\begin{pmatrix} 10 \\ 0 \end{pmatrix} 2^0 (-\sqrt{3}x)^{10} + \begin{pmatrix} 10 \\ 1 \end{pmatrix} 2^1 (-\sqrt{3}x)^{10-1} + \dots + \begin{pmatrix} 10 \\ 9 \end{pmatrix} 2^9 (-\sqrt{3x})^{10-9}$$

$$+ \begin{pmatrix} 10 \\ 9 \end{pmatrix} 2^{10} (-\sqrt{3}x)^{10-10}$$

The even terms; i.e. k=1,3,5,7 & 9 cancel each other So, we are left with only terms with k=0,2,4,6,8 &10

So total number of terms = 6

2. Question

Write the sum of the coefficients in the expansion $(1 - 3x + x^2)^{111}$.

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

 $(1-3x+x^2)^{111}$

For sum of coefficients; put x=1

We have;

```
(1-3+1)^{111}=(-1)^{111}
```

= -1

3. Question

Write the number of terms in the expansion of $(1-3x+3x^2-x^3)^8$.

Answer

Given:

$$(1-3x+3x^2-x^3)^8$$

Highest power is $(x^3)^8 = x^{24}$

And lowest power is \mathbf{x}^{0}

So the expansion contains all the terms ranging from 0 to 24

Therefore, total number of terms = 25

4. Question

Write the middle term in the expansion of

$$\left(\frac{2x^2}{3} + \frac{3}{2x^2}\right)^{10}$$

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(\frac{2x^{2}}{3} + \frac{3}{2x^{2}}\right)^{10} = \sum_{k=0}^{10} {10 \choose k} \left(\frac{2x^{2}}{3}\right)^{10-k} \left(\frac{3}{2x^{2}}\right)^{k}$$

Total number of terms = n+1 = 11

So middle term = 6^{th} term, i.e. k=5

 $= {\binom{10}{5}} {\left(\frac{2x^2}{3}\right)^{10-5}} {\left(\frac{3}{2x^2}\right)^5}$ $= \frac{10!}{5! \times 5!}$

=252

5. Question

Which term is independent of x, in the expansion of $\left(x - \frac{1}{3x^2}\right)^9$?

Answer

Given:

Get More Learning Materials Here : 📕

Regional www.studentbro.in

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(x-\frac{1}{3x^{2}}\right)^{9} = \sum_{k=0}^{9} {9 \choose k} x^{9-k} \left(\frac{-1}{3x^{2}}\right)^{k}$$
$$= \sum_{k=0}^{9} {9 \choose k} x^{9-k} \left(\frac{-1}{3}\right)^{k} x^{-2k}$$
$$\Rightarrow x^{(9-k-2k)} = x^{0}$$
$$\Rightarrow 9-3k = 0$$
$$\Rightarrow k=3$$

So 4th term is independent of x.

6. Question

If a and b denote respectively the coefficients of X^m and X^n in the expansion of $(1+X)^{m+n}$, then write the relation between a and b.

Answer

Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$(1 + x)^{m+n} = \sum_{k=0}^{m+n} {m+n \choose k} 1^{m+n-k} x^{k}$$

Coefficient of $X^{m;k=m}$

$$a = \binom{m+n}{m} 1^{m+n-m}$$
$$a = \frac{(m+n)!}{m! \times n!} \dots (1)$$

Coefficient of X^n ;k=n

$$\mathbf{b} = \binom{\mathbf{m} + \mathbf{n}}{\mathbf{n}} \mathbf{1}^{\mathbf{m} + \mathbf{n} - \mathbf{n}}$$

 $\mathbf{b} = \frac{(\mathbf{m} + \mathbf{n})!}{\mathbf{n}! \times \mathbf{m}!} \dots (2)$

Divide both equations;

We get;

a=b

7. Question

If a and b are coefficients of x^n in the expansion of $(1+x)^{2n}$ and $(1+x)^{2n-1}$ respectively, then write the relation between a and b.

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$(1+x)^{2n} = \sum_{k=0}^{2n} {2n \choose k} 1^{2n-k} x^{k}$$

Coefficient of X^n ;k=n

$$a = \binom{2n}{n} 1^{2n-n} \dots (1)$$
$$(1+x)^{2n-1} = \sum_{k=0}^{2n-1} \binom{2n-1}{k} 1^{2n-1-k} x^{k}$$

Coefficient of xⁿ;k=n

$$b = {\binom{2n-1}{n}} 1^{2n-1-n} \dots (2)$$

Divide both equations;

$$\frac{a}{b} = \frac{2n!}{n! \times n!} \times \frac{n! \times (n-1)!}{(2n-1)!}$$
$$\frac{a}{b} = \frac{2n(2n-1)!}{n! \times (n-1)!} \times \frac{n! \times (n-1)!}{(2n-1)!}$$
$$\frac{a}{b} = 2n$$

a=2b

8. Question

Write the middle term in the expansion of $\left(x+\frac{1}{x}\right)^{10}$.

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

Total terms = n+1 = 11

So middle term= 6^{th} term ; i.e. k=5

$$\left(x+\frac{1}{x}\right)^{10} = \sum_{k=0}^{10} {\binom{10}{k} x^{10-k} \left(\frac{1}{x}\right)^k}$$

For k=5;

$$= \binom{10}{5} x^{10-5} \left(\frac{1}{x}\right)^5$$
$$= {}^{10}C_5$$

9. Question

If a and b denote the sum of the coefficients in the expansions of $(1-3x+10x^2)^n$ and $(1+x^2)^n$ respectively, then write the relation between a and b.

Get More Learning Materials Here : 💻

R www.studentbro.in

Answer

Given:

 $(1-3x+10x^{2})^{n}$ Sum of coefficients = a $a = (1 - 3 + 10)^{n}$ $= (2^{3})^{n}$ $= (2^{n})^{3}$ $(1+x^{2})^{n}$ Sum of coefficients = b $b = (1+1)^{n}$ $= 2^{n}$

Put value of b in a; we get:

a=b³

10. Question

Write the coefficient of the middle term in the expansion of $(1 + x)^{2n}$

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$

$$(1 + x)^{2n} = \sum_{k=0}^{2n} {\binom{2n}{k}} 1^{2n-k} x^{k}$$

Total terms = 2n+1

```
Middle term = (2n+1)/2
```

i.e. (n+1)th term

so k=n

$$= \binom{2n}{n} 1^{2n-n} x^n$$
$$= {}^{2n}C_n$$

11. Question

Write the number of terms in the expansion of $\{(2x + y^3)^4\}^7$

Answer

Given:

$$\{(2x + y^3)^4\}^7 = (2x + y^3)^{28}$$
$$(x + a)^n = \sum_{k=0}^n {n \choose k} x^{n-k} a^k$$

$$(2x + y^3)^{28} = \sum_{k=0}^{28} {\binom{28}{k}} 2x^{28-k}(y^3)^k$$

So total number of terms = n+1

= 28+1

= 29

12. Question

Find the sum of coefficients of two middle terms in the binomial expansion of $(1 + x)^{2n-1}$

Answer

Given:

Total terms after expansion = 2n-1+1=2n

Middle term = 2n/2 = nth term

So two required middle terms are : nth & (n+1)th term

k = (n-1) & n for both terms respectively.

$$(x + a)^n = \sum_{k=0}^n {n \choose k} x^{n-k} a^k$$

$$(1 + x)^{2n-1} = \sum_{k=0}^{2n-1} {\binom{2n-1}{k}} 1^{2n-1-k} x^{k}$$

Coefficient of nth term;

$$=^{2n-1}C_{n-1}$$

Coefficient of (n+1)th term ;

 $= {}^{2n-1}C_n$

Sum of coefficients = ${}^{2n-1}C_{n-1} + {}^{2n-1}C_n$

 $= {}^{2n-1+1}C_n$

 $=^{2n}C_n$

13. Question

Find the ratio of the coefficients of x^{p} and x^{q} in the expansion of $(1 + x)^{p+q}$.

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$(1+x)^{p+q} = \sum_{k=0}^{p+q} {p+q \choose k} 1^{p+q-k} x^{k}$$

For x^p ; k=pCoefficient = ${}^{p+q}C_p$ (1) For x^q ; k=q

 $Coefficient = {}^{p+q}C_q (2)$

Divide both equations;

$$\frac{p}{q} = \frac{(p+q)!}{p! \times q!} \times \frac{p! \times q!}{(p+q)!}$$
$$\frac{p}{q} = 1$$

14. Question

Write last two digits of the number 3^{400} .

Answer

Given:

 $3^{400} = (3^2)^{200}$

 $= 9^{200}$

$$=(10-1)^{200}$$

By binomial expansion, $(x + a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$

$$(1-10)^{200} = \sum_{k=0}^{200} {200 \choose k} 1^{200-k} (-10)^k$$
$$= {200 \choose 0} (-10)^0 + {200 \choose 1} (-10)^1 + {200 \choose 2} (-10)^2 + \dots + {200 \choose 200} (-10)^{200}$$

 $=1-2000+10^{2}$ {I}

=1+100(I-20)

So, the last two digits would be 01.

15. Question

Find the number of terms in the expansion of $(a + b + c)^n$.

Answer

Given:

$$T_{n} = \frac{n!}{p! \times q! \times r!} a^{p} b^{q} c^{r};$$

Where p + q + r = n

Since number of ways in which we can divide n different things into r different things is : ${}^{n+r-1}C_{r-1}$

Here, n=n & r=3
So,
$$^{n+3-1}C_{3-1} = ^{n+2}C_2$$
$$= \frac{(n+2)!}{2! \times n!}$$
$$= \frac{(n+2)(n+1)n!}{2! \times n!}$$
$$= \frac{(n+1)(n+2)}{2}$$

so, the number of terms
$$=\frac{(n+1)(n+2)}{2}$$

16. Question

If a and b are the coefficients of ${_X}^n$ in the expansions $\left({1 + x} \right)^{2n}$ and $\left({1 + x} \right)^{2n - 1}$ respectively, find $\frac{a}{b}$.

Answer

Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$(1 + x)^{2n} = \sum_{k=0}^{2n} {2n \choose k} 1^{2n-k} x^{k}$$

Coefficient of X^n ;k=n

$$a = \binom{2n}{n} 1^{2n-n} (1)$$

$$(1+x)^{2n-1} = \sum_{k=0}^{2n-1} \binom{2n-1}{k} 1^{2n-1-k} x^k$$

Coefficient of X^n ;k=n

$$b = \binom{2n-1}{n} 1^{2n-1-n} (2)$$

Divide both equations;

$$\frac{a}{b} = \frac{2n!}{n! \times n!} \times \frac{n! \times (n-1)!}{(2n-1)!}$$
$$\frac{a}{b} = \frac{2n(2n-1)!}{n! \times (n-1)!} \times \frac{n! \times (n-1)!}{(2n-1)!}$$
$$\frac{a}{b} = 2n$$
$$a=2b$$

17. Question

Write the total number of terms in the expansion of $\left(x+a\right)^{100}+\left(x-a\right)^{100}\cdot$

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$(x+a)^{100} = \sum_{k=0}^{100} {100 \choose k} x^{100-k} a^{k}$$
$$= {100 \choose 0} x^{100} a^{0} + {100 \choose 1} x^{100-1} a^{1} + \dots + {100 \choose 99} x^{1} a^{99} + {100 \choose 100} x^{0} a^{100}$$

Get More Learning Materials Here : 📕

R www.studentbro.in

$$\begin{split} (x-a)^{n} &= \sum_{k=0}^{100} \binom{100}{k} x^{100-k} (-a)^{k} \\ &= \binom{100}{0} x^{100-0} (-a)^{0} + \binom{100}{1} x^{100-1} (-a)^{1} + \dots + \binom{100}{99} x^{1} (-a)^{99} \\ &\quad + \binom{100}{100} x^{0} (-a)^{100} \\ (x+a)^{100} + (x-a)^{100} \\ &= \binom{100}{0} x^{100} a^{0} + \binom{100}{1} x^{100-1} a^{1} + \dots + \binom{100}{99} x^{1} a^{99} + \binom{100}{100} x^{0} a^{100} + \\ \binom{100}{0} x^{100-0} (-a)^{0} + \binom{100}{1} x^{100-1} (-a)^{1} + \dots + \binom{100}{99} x^{1} (-a)^{99} \\ &\quad + \binom{100}{100} x^{0} (-a)^{100} \\ &= 2 \left\{ \binom{100}{0} x^{100} a^{0} + \binom{100}{2} x^{100-2} a^{2} + \dots + \binom{100}{100} x^{0} a^{100} \right\} \end{split}$$

So odd powers of x cancel each other, we are left with even powers of x or say odd terms of expansion. So total number of terms are $T_1, T_3, ... T_{99}, T_{101}$

$$=\frac{1+101}{2}$$

=51

18. Question

If $(1 - x + x^2)^n = a_0 + a_1x + a_2x^2 + \dots + a_{2n}x^{2n}$, find the value of $a_0 + a_2 + a_4 + \dots + a_{2n}$.

Answer

 $(1 - x + x^{2})^{n} = a_{0} + a_{1}x + a_{2}x^{2} + \dots + a_{2n}x^{2n}$ At x = 1 $(1 - 1 + 1^{2})^{n} = a_{0} + a_{1}(1) + a_{2}(1)^{2} + \dots + a_{2n}(1)^{2n}$ $a_{0} + a_{1} + a_{2} + \dots + a_{2n} = 1 \dots (1)$ At x = -1 $(1 - (-1) + (-1)^{2})^{n} = a_{0} + a_{1}(-1) + a_{2}(-1)^{2} + \dots + a_{2n}(-1)^{2n}$ $a_{0} - a_{1} + a_{2} - \dots + a_{2n} = 3^{n} \dots (2)$ On adding eq.1 and eq.2 $(a_{0} + a_{1} + a_{2} + \dots + a_{2n}) + (a_{0} - a_{1} + a_{2} - \dots + a_{2n}) = 1 + 3^{n}$ $2(a_{0} + a_{2} + a_{4} + \dots + a_{2n}) = 1 + 3^{n}$ $a_{0} + a_{2} + a_{4} + \dots + a_{2n} = \frac{1+3^{n}}{2}$

MCQ

1. Question

Mark the correct alternative in the following :

If in the expansion of $\left(1+x\right)^{20}$, the coefficient of rth and (r +4) th terms are equal, then r is equal to

A.7

- B. 8
- C. 9
- D. 10

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^k a^{n-k}$$

In rth term; k=r-1

& in (r+4)th term ; k=r+3

So, the terms are;

$$\binom{20}{r-1} 1^{21-r} x^{r-1} \, \& \, \binom{20}{r+3} 1^{17-r} x^{r+3}$$

Coefficients of both terms are equal:

$$\binom{20}{r-1} = \binom{20}{r+3}$$

$$\frac{20!}{(r-1)!(21-r)!} = \frac{20!}{(r+3)!(17-r)!}$$

$$\frac{1}{(r-1)!(21-r)(20-r)(19-r)(18-r)(17-r)!}$$

$$= \frac{1}{(r+3)(r+2)(r+1)r(r-1)!(17-r)!}$$

$$\frac{1}{(21-r)(20-r)(19-r)(18-r)} = \frac{1}{(r+3)(r+2)(r+1)r}$$

$$l$$

$$(r+3)(r+2)(r+1)r = (21-r)(20-r)(19-r)(18-r)$$
So, r = (21-r);

$$(r+1) = (20-r);$$

$$(r+2) = (19-r);$$

$$(r+3) = (18-r)$$
We get;

$$r = 9$$

2. Question

Mark the correct alternative in the following :

The term without x in the expansion of $\left(2x - \frac{1}{2x^2}\right)^{12}$ is

A.495

- B. -495
- C. -7920
- D. 7920

Answer

Given:

$$\begin{aligned} (x+a)^n &= \sum_{k=0}^n \binom{n}{k} x^k a^{n-k} \\ \left(2x - \frac{1}{2x^2}\right)^{12} &= \sum_{k=0}^{12} \binom{12}{k} (2x)^{12-k} \left(\frac{-1}{2x^2}\right)^k \\ &= \sum_{k=0}^{12} \binom{12}{k} 2^{12-k} (x)^{12-k} \left(\frac{-1}{2}\right)^k x^{-2k} \end{aligned}$$

The term without x is where :

 $x^{12-k-2k} = x^0$

12-3k=0

k=4

for k=4; the term is :

$$= \binom{12}{4} (2x)^{12-4} \left(\frac{-1}{2x^2}\right)^4$$
$$= \frac{12!}{4! \times 8!} \times 2^8 \times x^8 \times \left(\frac{-1}{2}\right)^4 \times x^{-8}$$
$$= 7920$$

3. Question

Mark the correct alternative in the following :

If rth term in the expansion of $\left(2x^2-\frac{1}{x}\right)^{12}$ is without x, then r is equal to.

A.8

B. 7

C. 9

D. 10

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{k} a^{n-k}$$
$$\left(2x^{2} - \frac{1}{x}\right)^{12} = \sum_{k=0}^{12} {12 \choose k} (2x^{2})^{12-k} \left(\frac{-1}{x}\right)^{k}$$

$$=\sum_{k=0}^{12} \binom{12}{k} 2^{k} (-1)^{12-k} x^{2(12-k)} x^{-k}$$

For term without x:

 $x^{2(12-k)-k} = x^{0}$ 24-2k-k=0 24-3k=0 k=8 for k= 8; term = 8+1=9th term

$term = 8 + 1 = 9^{crr}$ ter

4. Question

Mark the correct alternative in the following :

If in the expansion of $(a + b)^n$ and $(a + b)^{n+3}$, the ratio of the coefficients of second and third terms, and third and fourth terms respectively are equal, then n is

A.3

В. 4

- C. 5
- D. 6

Answer

Given:

$$\begin{split} (x+a)^{n} &= \sum_{k=0}^{n} {n \choose k} a^{n-k} x^{k} \\ (a+b)^{n} &= \sum_{k=0}^{n} {n \choose k} a^{n-k} b^{k} \\ T_{2} &= {n \choose 1} a^{n-1} b^{1} ; \ T_{3} &= {n \choose 2} a^{n-2} b^{2} \\ \frac{T1}{T3} &= \frac{{n \choose 1} a^{n-1} b^{1}}{{n \choose 2} a^{n-2} b^{2}} \\ &= \frac{n! \times 2! \times (n-2)! \times a^{n} a^{-1} b}{n! \times 1! \times (n-1)! \times a^{n} a^{-2} b^{2}} \\ &= \frac{2 \times (n-2)! \times a}{(n-1)(n-2)! \times b} \\ &= \frac{2a}{(n-1)b} (1) \\ (a+b)^{n+3} &= \sum_{k=0}^{n+3} {n+3 \choose k} a^{n+3-k} b^{k} \\ T_{3} &= {n+3 \choose 2} a^{n+3-2} b^{2} ; \ T_{4} &= {n+3 \choose 3} a^{n+3-3} b^{3} \end{split}$$

$$\frac{T3}{T4} = \frac{\binom{n+3}{2}a^{n+1}b^2}{\binom{n+3}{3}a^nb^3}$$
$$= \frac{n! \times 3! \times n! \times a^na^1b^2}{n! \times 2! \times (n+1)! \times a^nb^3}$$
$$= \frac{3! \times n! \times a}{2! \times (n+1)n! \times b}$$
$$= \frac{3a}{(n+1)b} (2)$$
Equating both equations:

2 2

$$\frac{2a}{(n-1)b} = \frac{3a}{(n+1)b}$$
$$2(n+1)=3(n-1)$$
$$2n+2 = 3n-3$$
$$n=5$$

5. Question

Mark the correct alternative in the following :

If A and B are the sums of odd and even terms respectively in the expansion of $\left(x+a\right)^n$, then

 $\left(x+a\right)^{2n}-\left(x-a\right)^{2n}$ is equal to A.4 (A+B) B. 4 (A - B) C. AB D. 4 AB Answer Given: $(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$

$$\begin{split} &= \binom{n}{0} x^{n} a^{0} + \binom{n}{1} x^{n-1} a^{1} + \dots + \binom{n}{n-1} x^{1} a^{n-1} + \binom{n}{n} x^{0} a^{n} \\ &(x-a)^{n} = \sum_{k=0}^{n} \binom{n}{k} x^{n-k} (-a)^{k} \\ &= \binom{n}{0} x^{n-0} (-a)^{0} + \binom{n}{1} x^{n-1} (-a)^{1} + \dots + \binom{n}{n-1} x^{1} (-a)^{99} + \binom{n}{n} x^{0} (-a)^{n} \\ &\text{So, } (x+a)^{n} + (x-a)^{n} = \binom{n}{0} x^{n} a^{0} + \binom{n}{1} x^{n-1} a^{1} + \dots + \binom{n}{n-1} x^{1} a^{n-1} + \binom{n}{n} x^{0} a^{n} + \\ &\binom{n}{0} x^{n-0} (-a)^{0} + \binom{n}{1} x^{n-1} (-a)^{1} + \dots + \binom{n}{n-1} x^{1} (-a)^{n-1} + \binom{n}{n} x^{0} (-a)^{n} \\ &= 2 \left\{ \binom{n}{0} x^{n} a^{0} + \binom{n}{2} x^{n-2} a^{2} + \dots + \binom{n}{n} x^{0} a^{n} \right\} \\ &= 2A \end{split}$$

Get More Learning Materials Here :

🕀 www.studentbro.in

So,
$$(x + a)^{n} - (x - a)^{n} = {n \choose 0} x^{n} a^{0} + {n \choose 1} x^{n-1} a^{1} + \dots + {n \choose n-1} x^{1} a^{n-1} + {n \choose n} x^{0} a^{n} - {n \choose 0} x^{n-0} (-a)^{0} + {n \choose 1} x^{n-1} (-a)^{1} + \dots + {n \choose n-1} x^{1} (-a)^{n-1} + {n \choose n} x^{0} (-a)^{n}$$

$$= 2 \left\{ {n \choose 1} x^{n-1} a^{1} + {n \choose 1} x^{n-3} a^{3} + \dots + {n \choose n-1} x^{1} a^{n-1} \right\}$$

$$= 2B$$

$$(x + a)^{2n} - (x - a)^{2n} = [(x + a)^{n}]^{2} - [(x - a)^{n}]^{2}$$

$$= \{ (x + a)^{n} + (x - a)^{n} \} \times \{ (x + a)^{n} - (x - a)^{n} \}$$

=2A**x**2B

=4AB

6. Question

Mark the correct alternative in the following :

The number of irrational terms in the expansion of $(4^{1/5} + 7^{1/10})^{45}$ is

A. 40

B. 5

C. 41

D. None of these

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{k} a^{n-k}$$
$$(4^{1/5} + 7^{1/10})^{45} = \sum_{k=0}^{45} {45 \choose k} (4^{1/5})^{k} (7^{1/10})^{45-k}$$

Total number of terms in expansion =n+1

=45+1

=46

irrational terms = total terms - rational terms

For rational terms; the power of each term should be integer.

Therefore, k must be divisible by 5 and (45-k) by 10.

i.e. the terms having power as multiples of 5.

i.e. 0,5,10,15,20,25,30,35,40 & 45

for k= 5,15,25,35 & 45;

(45-k) do not give an integral power, so these powers have to be rejected.

Now, we have k = 0,10,20,30 & 40 which give us rational terms.

Hence, irrational terms = 46-5 = 41

7. Question

Mark the correct alternative in the following :

The coefficient of x⁻¹⁷ in the expansion of $\left(x^4 - \frac{1}{x^3}\right)^{15}$ is

A.1365

B. -1365

C. 3003

D. -3003

Answer

Given:

-

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$

$$\left(x^{4} - \frac{1}{x^{3}}\right)^{15} = \sum_{k=0}^{15} {15 \choose k} (x^{4})^{15-k} \left(\frac{-1}{x^{3}}\right)^{k}$$

$$= \sum_{k=0}^{15} {15 \choose k} x^{4(15-k)} (-1)^{k} x^{-3k}$$

$$x^{4(15-k)-3k} = x^{-17}$$

$$60 - 4k - 3k = -17$$

$$-7k = -77$$

$$k = 11$$

$$= {15 \choose 11} x^{4(15-11)} (-1)^{11} x^{-3\times 11}$$

$$= {15 \choose 11} x^{16} (-1)^{11} x^{-33}$$

$$= -\frac{15!}{11! \times 4!} x^{-17}$$

Coefficient = -1365

8. Question

Mark the correct alternative in the following :

In the expansion of $\left(x^2 - \frac{1}{3x}\right)^9$, the term without x is equal to A. $\frac{28}{81}$ B. $\frac{-28}{243}$

C. $\frac{28}{243}$

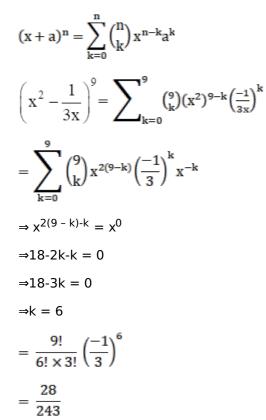

Get More Learning Materials Here : 📕

CLICK HERE

Answer

Given:

9. Question

Mark the correct alternative in the following :

If in the expansion of $(1+x)^{15}$, the coefficients of $(2r+3)^{th}$ and $(r-1)^{th}$ terms are equal, then the value of r is

- A.5
- B. 6
- C. 4
- D. 3

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

$$(1+x)^{15} = \sum_{k=0}^{15} {15 \choose k} 1^{15-k} x^{k}$$

For (2r+3)th term; k=(2r+2)

$$\binom{15}{2r+2}1^{15-2r-2}x^{2r+2}$$

For (r-1)th term; k=r-2

$$\binom{15}{r-2} 1^{15-r+2} x^{r-2}$$

Coefficients of both terms are equal;

$$\binom{15}{2r+2} = \binom{15}{r-2}$$

$$\Rightarrow \frac{15!}{(2r+2)!(13-2r)!} = \frac{15!}{(r-2)!(17-r)!}$$

$$\Rightarrow \frac{1}{(2r+2)(2r+1)(2r)!(13-2r)!} = \frac{1}{(r-2)(r-1)r!(17-r)!}$$

$$\Rightarrow \frac{1}{2(2r+2)(2r+1)(13-2r)!} = \frac{1}{(r-2)(r-1)(17-r)!}$$

10. Question

Mark the correct alternative in the following :

The middle term in the expansion of $\left(\frac{2x^2}{3} + \frac{3}{2x^2}\right)^{10}$ is

A.251

B. 252

C. 250

D. None of these

Answer

Given:

n= 10

Total number of terms on expansion = n+1 = 11

So middle term is 6^{th} term; i.e. k=5

$$=\frac{10!}{5!\times 5!}\left(\frac{2x^2}{3}\right)^5\left(\frac{3}{2x^2}\right)^5$$

= 252

11. Question

Mark the correct alternative in the following :

If in the expansion of
$$\left(x^4-\frac{1}{3}\right)^{\!\!15},x^{-17} \text{occurs in } r^{\text{th}}$$
 term, then
 A.r = 10

B. r = 11

C. r = 12

_ _ _

D. r = 13

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

$$\left(x^{4} - \frac{1}{x^{3}}\right)^{15} = \sum_{k=0}^{15} {\binom{15}{k}} (x^{4})^{15-k} \left(\frac{-1}{x^{3}}\right)^{k}$$

$$=\sum_{k=0}^{15} {\binom{15}{k}} x^{4(15-k)} (-1)^k x^{-3k}$$

 $\Rightarrow x^{4(15-k)-3k} = x^{-17}$

⇒ 60-4k-3k = -17

So, the term is 12th term.

12. Question

Mark the correct alternative in the following :

In the expansion of
$$\left(x - \frac{1}{3x^2}\right)^9$$
, the term independent of x is

 $A.T_3$

 $\mathsf{B}.\ \mathsf{T}_4$

D. None of these

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(x-\frac{1}{3x^{2}}\right)^{9} = \sum_{k=0}^{9} {9 \choose k} x^{9-k} \left(\frac{-1}{3x^{2}}\right)^{k}$$
$$= \sum_{k=0}^{9} {9 \choose k} x^{9-k} \left(\frac{-1}{3}\right)^{k} x^{-2k}$$
$$\Rightarrow x^{9-k-2k} = x^{0}$$
$$\Rightarrow 9-3k = 0$$
$$\Rightarrow k = 3$$

So, the term is 4th term.

13. Question

Mark the correct alternative in the following :

If in the expansion of $(1 + y)^n$, the coefficients of 5th, 6th and 7th terms are in A.P., then n is equal to

A.7, 11

B.7,14

D. None of these

Answer

Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$

$$(1 + y)^{n} = \sum_{k=0}^{n} {n \choose k} 1^{n-k} y^{k}$$

$$T_{5} = {n \choose 4} 1^{n-4} y^{4} : T_{6} = {n \choose 5} 1^{n-5} y^{5} \& T_{7} = {n \choose 6} 1^{n-6} y^{6}$$
Since T_{5} , $T_{6} \& T_{7}$ are in AP
Then; $2(T_{6}) = T_{5} + T_{7}$
i.e. ${n \choose 4} 1^{n-4} y^{4} + {n \choose 6} 1^{n-6} y^{6} = 2 \times {n \choose 5} 1^{n-5} y^{5}$

$$\frac{n!}{4! (n-4)!} + \frac{n!}{6! (n-6)!} = 2 \times \frac{n!}{5! (n-5)!}$$

$$\frac{1}{4! (n-4) (n-5) (n-6)!} + \frac{1}{6! (n-6)!} = 2 \times \frac{1}{5! (n-5) (n-6)!}$$

$$\frac{1}{(n-4) (n-5)} + \frac{1}{30} - \frac{2}{5(n-5)} = 0$$

$$\frac{30 + (n-4) (n-5) - 12(n-4)}{30(n-4)(n-5)} = 0$$

$$\Rightarrow 30 + (n-4) (n-5) - 12(n-4) = 0$$

$$\Rightarrow 30 + n^{2} - 9n + 20 - 12n + 48 = 0$$

$$\Rightarrow n^{2} - 21n + 98 = 0$$

$$\Rightarrow (n-7) (n-14) = 0$$

⇒n=7,14

14. Question

Mark the correct alternative in the following :

In the expansion of
$$\left(\frac{1}{2}x^{1/3} + x^{-1/5}\right)^8$$
, the term independent of x is A.T₅
B. T₆
C. T₇
D. T₈
Answer
Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$

$$\left(\frac{1}{2}x^{\frac{1}{3}} + x^{-\frac{1}{5}}\right)^{8} = \sum_{k=0}^{8} {8 \choose k} \left(\frac{1}{2}x^{1/3}\right)^{8-k} (x^{-1/5})^{k}$$

$$= \sum_{k=0}^{8} {8 \choose k} \left(\frac{1}{2}\right)^{8-k} x^{\frac{(8-k)}{3}} x^{\frac{-k}{5}}$$

$$\Rightarrow x^{\frac{(8-k)}{3} - \frac{k}{5}} = x^{0}$$

$$\Rightarrow \frac{(8-k)}{3} - \frac{k}{5} = 0$$

$$\Rightarrow \frac{5(8-k) - 3k}{15} = 0$$

$$\Rightarrow 40-5k-3k = 0$$

$$\Rightarrow 40-8k = 0$$

$$\Rightarrow k = 5$$

So, the term is 6th term.

15. Question

Mark the correct alternative in the following :

If the sum of odd numbered terms and the sum of even numbered terms in the expansion $of(x + a)^n$ are A and B respectively, then the value of $(x^2 - a^2)^n$ is.

 ${}^{\mathsf{A}}\!\cdot\!A^2-\!B^2$

B.
$$A^2 + B^2$$

- C. 4 AB
- D. None of these

Answer

Given:

$$\begin{split} &(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k} \\ &= {n \choose 0} x^{n} a^{0} + {n \choose 1} x^{n-1} a^{1} + \dots + {n \choose n-1} x^{1} a^{n-1} + {n \choose n} x^{0} a^{n} \\ &= A+B \\ &(x-a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} (-a)^{k} \\ &= {n \choose 0} x^{n-0} (-a)^{0} + {n \choose 1} x^{n-1} (-a)^{1} + \dots + {n \choose n-1} x^{1} (-a)^{99} + {n \choose n} x^{0} (-a)^{n} \\ &= A-B \end{split}$$

Get More Learning Materials Here :

🕀 www.studentbro.in

$$(x^2-a^2)^n = [(x+a)(x-a)]^n$$

= $(x+a)^n (x-a)^n$

= (A+B) (A-B)

 $=A^{2}-B^{2}$

16. Question

Mark the correct alternative in the following :

If the coefficient of x in
$$\left(x^2 + \frac{\lambda}{x}\right)^5$$
 is 270, then $\lambda = A.3$

B. 4

C. 5

D. None of these

Answer

Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$

$$\left(x^{2} + \frac{\lambda}{x}\right)^{5} = \sum_{k=0}^{5} {5 \choose k} (x^{2})^{5-k} {\lambda \choose x}^{k}$$

$$= \sum_{k=0}^{5} {5 \choose k} x^{2(5-k)} \lambda^{k} x^{-k}$$

$$\Rightarrow x^{2(5-k)-k} = x^{1}$$

$$\Rightarrow 10 \cdot 2k \cdot k = 1$$

$$\Rightarrow 9 \cdot 3k = 0$$

$$\Rightarrow k = 3$$
for k = 3;
$$\Rightarrow {5 \choose 3} x^{2(5-3)} \lambda^{3} x^{-3}$$

$$\Rightarrow \frac{5!}{3! \times 2!} \lambda^{3} = 270$$

$$\Rightarrow \lambda^{3} = 27$$

$$\Rightarrow \lambda = 3$$
17. Question

Mark the correct alternative in the following :

The coefficient of ${}_X{}^4 \text{in} \left(\frac{x}{2} \!-\! \frac{3}{2} \right)^{\!\!\!10}$ is.

A.	$\frac{405}{256}$
в.	$\frac{504}{259}$

c.
$$\frac{450}{263}$$

D. None of these

Answer

Given:

$$\Rightarrow (x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\Rightarrow \left(\frac{x}{2} - \frac{3}{2}\right)^{10} = \sum_{k=0}^{10} {10 \choose k} \left(\frac{x}{2}\right)^{10-k} \left(\frac{-3}{2}\right)^{k}$$
$$\Rightarrow x^{10-k} = x^{4}$$
$$\Rightarrow 10-k=4$$

for k=6;

$$= {\binom{10}{6}} {\binom{X}{2}}^{10-6} {\binom{-3}{2}}^{6}$$
$$= \frac{10!}{6! \times 4!} \times \frac{(-3)^{6}}{2^{10}} x^{4}$$

So, the coefficient of $x^4=~105 \times \frac{729}{512}$

18. Question

Mark the correct alternative in the following :

The total number of terms in the expansion of $\left(x+a
ight)^{100}+\left(x-a
ight)^{100}$ after simplification is

A.202

B. 51

- C. 50
- D. None of these

Answer

Given:

$$\begin{split} (x+a)^n &= \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k \\ (x+a)^{2n} &= \sum_{k=0}^{2n} \binom{2n}{k} x^{2n-k} a^k \end{split}$$

$$\begin{split} &= \binom{2n}{0} x^{2n} a^0 + \binom{2n}{1} x^{2n-1} a^1 + \dots + \binom{2n}{99} x^1 a^{99} + \binom{2n}{2n} x^0 a^{2n} \\ &(x-a)^n = \sum_{k=0}^{2n} \binom{2n}{k} x^{2n-k} (-a)^k \\ &= \binom{2n}{0} x^{2n-0} (-a)^0 + \binom{2n}{1} x^{2n-1} (-a)^1 + \dots + \binom{2n}{99} x^1 (-a)^{99} + \binom{2n}{2n} x^0 (-a)^{2n} \\ &(x+a)^{100} + (x-a)^{100} \\ &= \binom{2n}{0} x^{2n} a^0 + \binom{2n}{1} x^{2n-1} a^1 + \dots + \binom{2n}{99} x^1 a^{99} + \binom{2n}{2n} x^0 a^{2n} + \\ &\binom{2n}{0} x^{2n-0} (-a)^0 + \binom{2n}{1} x^{2n-1} (-a)^1 + \dots + \binom{2n}{99} x^1 (-a)^{99} + \binom{2n}{2n} x^0 (-a)^{2n} \\ &= 2\left\{\binom{2n}{0} x^{2n-0} (-a)^0 + \binom{2n}{2} x^{2n-2} a^2 + \dots + \binom{2n}{2n} x^0 a^{2n}\right\} \end{split}$$

So odd powers of x cancel each other, we are left with even powers of x or say odd terms of expansion. So total number of terms are $T_1, T_3, ... T_{99}, T_{101}$

$$=\frac{1+101}{2}$$

=51

19. Question

Mark the correct alternative in the following :

If T_2 / T_3 in the expansion of $(a + b)^n$ and T_3 / T_4 in the expansion of $(a + b)^{n+3}$ are equal, then n =

A.3

B. 4

C. 5

D. 6

Answer

Given:

$$\begin{split} &(x+a)^n = \sum_{k=0}^n \binom{n}{k} a^{n-k} x^k \\ &(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^{n-k} b^k \\ &T_2 = \binom{n}{1} a^{n-1} b^1 \text{ ; } T_3 = \binom{n}{2} a^{n-2} b^2 \\ &\frac{T1}{T3} = \frac{\binom{n}{1} a^{n-1} b^1}{\binom{n}{2} a^{n-2} b^2} \\ &= \frac{n! \times 2! \times (n-2)! \times a^n a^{-1} b}{n! \times 1! \times (n-1)! \times a^n a^{-2} b^2} \end{split}$$

$$= \frac{2 \times (n-2)! \times a}{(n-1)(n-2)! \times b}$$

$$= \frac{2a}{(n-1)b} (1)$$

$$(a+b)^{n+3} = \sum_{k=0}^{n+3} {\binom{n+3}{k}} a^{n+3-k} b^{k}$$

$$T_{3} = {\binom{n+3}{2}} a^{n+3-2} b^{2} ; T_{4} = {\binom{n+3}{3}} a^{n+3-3} b^{3}$$

$$\frac{T_{3}}{T_{4}} = \frac{{\binom{n+3}{2}} a^{n+1} b^{2}}{{\binom{n+3}{3}} a^{n} b^{3}}$$

$$= \frac{n! \times 3! \times n! \times a^{n} a^{1} b^{2}}{n! \times 2! \times (n+1)! \times a^{n} b^{3}}$$

$$= \frac{3! \times n! \times a}{2! \times (n+1)n! \times b}$$

$$= \frac{3a}{(n+1)b} (2)$$

Equating both equations:

$$\frac{2a}{(n-1)b} = \frac{3a}{(n+1)b}$$
$$\Rightarrow 2(n+1)=3(n-1)$$
$$\Rightarrow 2n+2 = 3n-3$$
$$\Rightarrow n=5$$

20. Question

Mark the correct alternative in the following :

The coefficient of $\displaystyle \frac{1}{x}$ in the expansion of $\displaystyle \left(1+x\right)^n \displaystyle \left(1+\frac{1}{x}\right)^n$ is.

A.
$$\frac{n!}{\{(n-1)!(n+1)!\}}$$

B. $\frac{(2n)!}{[(n-1)!(n+1)!]}$

C.
$$\frac{(2n)!}{(2n-1)!(2n+1)!}$$

D. None of these

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

$$(1+x)^{n} \left(1+\frac{1}{x}\right)^{n} = \frac{(1+x)^{n}(1+x)^{n}}{x^{n}}$$
$$= \frac{(1+x)^{2n}}{x^{n}}$$
$$= \frac{1}{x^{n}} \sum_{k=0}^{2n} {\binom{2n}{k}} 1^{2n-k} x^{k}$$

For x⁻¹;

$$\Rightarrow \frac{x^k}{x^n} = x^{-1}$$

 $\Rightarrow x^{k-n} = x^{-1}$

⇒k-n=-1

⇒k=n-1

So, coefficient $=\frac{2n!}{(n-1)!(n+1)!}$

21. Question

Mark the correct alternative in the following :

If the sum of the binomial coefficients of the expansion $\left(2x + \frac{1}{x}\right)^n$ is equal to 256, then the term independent of x is

A.1120

B. 1020

C. 512

D. None of these

Answer

Given:

Sum of binomial coefficients = 2^n

=256

⇒2ⁿ=2⁸

⇒ n=8

so total terms = n+1

=9

Middle term = 5^{th} term; i.e. k=4

So, term independent of $x = \binom{8}{4} (2x)^{8-4} \left(\frac{1}{x}\right)^4$

$$=\frac{8!}{4! \times 4!} 2^4$$

= 1120

22. Question

Mark the correct alternative in the following :

If the fifth term of the expansion $(a^{2/3} + a^{-1})^n$ does not contain 'a'. Then n is equal to

A.2

B. 5

C. 10

D. None of these

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(a^{\frac{2}{3}} + a^{-1}\right)^{n} = \sum_{k=0}^{n} {n \choose k} \left(a^{\frac{2}{3}}\right)^{n-k} (a^{-1})^{k}$$
$$= \sum_{k=0}^{n} {n \choose k} a^{\frac{2(n-k)}{3}-k}$$

Term 5 ; i.e. k=4:

$$a^{\frac{2(n-k)}{3}-k} = a^{0}$$

$$\frac{2(n-4) - 3(4)}{3} = 0$$

⇒2n-8-12=0

23. Question

Mark the correct alternative in the following :

The coefficient of
$${}_{\rm X}{}^{-3}$$
 in the expansion of $\left({}_{\rm X}{}-{}^{m}_{\rm X}{}^{11} \right)^{\!\!11}$ is

- A._924m⁷
- в. –792m⁵
- C. _792m⁶
- D. -330m⁷

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

$$\left(x - \frac{m}{x}\right)^{11} = \sum_{k=0}^{11} {\binom{11}{k}} x^{11-k} {\binom{-m}{x}}^k$$

$$= \sum_{k=0}^{11} {\binom{11}{k}} x^{11-k} {(-m)}^k x^{-k}$$

$$\Rightarrow x^{11-k-k} = x^{-3}$$

$$\Rightarrow 11-2k=-3$$

$$\Rightarrow 14-2k=0$$

$$\Rightarrow k = 7$$

for k=7; coefficient is:

$$=\frac{11!}{7!\times 4!}(-m)^7$$

=-330m⁷

24. Question

Mark the correct alternative in the following :

The coefficient of the term independent of x in the expansion of $\left(ax + \frac{b}{x}\right)^{14}$ is

A.14!a⁷b⁷
B.
$$\frac{14!}{7!}a^{7}b^{7}$$

C. $\frac{14!}{(7!)^{2}}a^{7}b^{7}$
D. $\frac{14!}{(7!)^{3}}a^{7}b^{7}$

Answer

Given:

$$(x + a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(ax + \frac{b}{x}\right)^{14} = \sum_{k=0}^{14} {14 \choose k} (ax)^{14-k} \left(\frac{b}{x}\right)^{k}$$
$$= \sum_{k=0}^{14} {14 \choose k} a^{14-k} b^{k} x^{14-k} x^{-k}$$
$$x^{14-k-k} = x^{0}$$
$$14-2k=0$$

So, the coefficient is:

$$=\frac{14!}{7!\times7!}a^7b^7$$

25. Question

Mark the correct alternative in the following :

The coefficient of ${_X}^5$ in the expansion of $\left(1+x\right)^{21}+\left(1+x\right)^{22}+...+\left(1+x\right)^{30}$ is.

A.⁵¹C₅

- B. ⁹C₅
- C. ${}^{31}C_6 {}^{21}C_6$

D.
$${}^{30}C_5 + {}^{20}C_5$$

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

 $(1+x)^{21}+(1+x)^{22}+...+(1+x)^{30}$

Coefficient of x⁵in any expansion = $\binom{n}{5}1^{n-5}x^5$; i.e. ${}^{n}C_5$

So, coefficient of x^5 in above expansion = ${}^{21}C_5 + {}^{22}C_5 + {}^{23}C_5 + ... + {}^{30}C_5$

26. Question

Mark the correct alternative in the following :

The coefficient of ${}_X{}^8y^{10}\,\text{in the expansion}\,\left(x+y\right)^{18}\text{is.}$

B. ¹⁸P₁₀

C. 2¹⁸

D. None of these

Answer

Given:

$$(x + y)^{18} = \sum_{k=0}^{18} {\binom{18}{k}} x^{18-k}y^k$$

For $x^8 y^{10}$; k=10 So coefficient is ${}^{18}C_{10}$ Also ${}^{18}C_{10} = {}^{18}C_8$

So coefficient = ${}^{18}C_8$

27. Question

Mark the correct alternative in the following :

If the coefficients of the $(n+1)^{th}$ term and the $(n+3)^{th}$ term in the expansion of $(1+x)^{20}$ are equal, then the value of n is

A.10

B. 8

C. 9

D. None of these

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$(1+x)^{20} = \sum_{k=0}^{20} {20 \choose k} 1^{20-k} x^{k}$$

k=0

For nth term ; k=n-1

So for (n+1)th term ; k= n

& for (n+3)th term ; k = n+2

Coefficients for the above terms are equal;

$$\frac{20!}{n!(20-n)!} = \frac{20!}{(n+2)!(18-n)!}$$

$$\frac{1}{n! \times (20-n)(19-n)(18-n)!} = \frac{1}{(n+2)(n+1)n! \times (18-n)!}$$

$$(20-n)(19-n) = (n+2)(n+1)$$

$$380-39n+n^2 = n^2+3n+2$$

$$42n-378=0$$

$$n=9$$

28. Question

Mark the correct alternative in the following :

If the coefficients of 2nd, 3rd and 4th terms in the expansion of $\left(1+x\right)^n, n \in \mathbb{N}$ are in A.P., then n =

A.7

B. 14

C. 2

D. None of these

Answer

Given:

Regional www.studentbro.in

 $(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$ $(1+x)^n = \sum_{k=1}^n \binom{n}{k} 1^{n-k} x^k$ $T_2 = {n \choose 1} 1^{n-1} x^1$; $T_3 = {n \choose 2} 1^{n-2} x^2 \& T_4 = {n \choose 2} 1^{n-3} x^3$ Since T_2 , T_3 & T_4 are in AP Then; $2(T_3) = T_2 + T_4$ i.e. $\binom{n}{1} 1^{n-1} x^1 + \binom{n}{2} 1^{n-3} x^3 = 2 \times \binom{n}{2} 1^{n-2} x^2$ $\frac{n!}{1!(n-1)!} + \frac{n!}{3!(n-3)!} = 2 \times \frac{n!}{2!(n-2)!}$ $\frac{1}{1!(n-1)(n-2)(n-3)!} + \frac{1}{3!(n-3)!} = 2 \times \frac{1}{2!(n-2)(n-3)!}$ $\frac{1}{(n-1)(n-2)} + \frac{1}{6} = \frac{1}{(n-2)}$ $\frac{1}{(n-1)(n-2)} + \frac{1}{6} - \frac{1}{(n-2)} = 0$ $\frac{6}{6(n-1)(n-2)} + \frac{(n-1)(n-2)}{6(n-1)(n-2)} - \frac{6(n-1)}{6(n-1)(n-2)} = 0$ (n-1)(n-2)-6(n-1)+6=0 $n^{2}-3n+2-6n+6+6=0$ $n^{2}-9n+14=0$ (n-2)(n-7)=0n= 2.7 n=2 rejected for term 3rd

So n=7

29. Question

Mark the correct alternative in the following :

The middle term in the expansion of $\left(\frac{2x}{3} - \frac{3}{2x^2}\right)^{2n}$ is.

$$A.^{2n}C_n$$

 $\mathsf{B.} \left(-1\right)^{n-2n} C_n \ \mathbf{X}^{-n}$

C.
$${}^{2n}C_n X^{-n}$$

D. None of these

Answer

Given:

Get More Learning Materials Here : 📕

CLICK HERE

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(\frac{2x}{3} - \frac{3}{2x^{2}}\right)^{2n} = \sum_{k=0}^{2n} {2n \choose k} \left(\frac{2x}{3}\right)^{2n-k} \left(\frac{-3}{2x^{2}}\right)^{k}$$

For middle term,

$$T_{n} = {\binom{2n}{n}} {\binom{2x}{3}}^{2n-k=\frac{2n}{2}=nn} {\binom{-3}{2x^{2}}}^{n}$$
$$= {\binom{2n}{n}} {\binom{2}{3}}^{n} {\binom{3}{2}}^{n} (-1)^{n} x^{n} x^{-2n}$$
$$= {\binom{2n}{n}} (-1)^{n} x^{-n}$$
$$= (-1)^{n} {\binom{2n}{n}} x^{-n}$$

30. Question

Mark the correct alternative in the following :

If r^th term is the middle term in the expansion of $\left(x^2-\frac{1}{2x}\right)^{20}$, then $\left(r+3\right)^{th}$ term is

A. ²⁰ C₁₄
$$\left(\frac{x}{2^{14}}\right)$$

B. ²⁰ C₁₂ $x^2 2^{-12}$

$$C. -^{20}C_7 x.2^{-13}$$

D. None of these

Answer

Given:

$$\begin{split} (x+a)^n &= \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k \\ \left(x^2 - \frac{1}{2x}\right)^{20} &= \sum_{k=0}^{20} \binom{20}{k} (x^2)^{20-k} \left(\frac{-1}{2x}\right)^k \end{split}$$

Total terms = n+1 = 21

Mid term = $21/2 = 11^{\text{th}}$ term

For k = 10, it is rth term.

So (r+3)th term = 11th term

k=13

$$T_{14} = {\binom{20}{13}} (x^2)^{20-13} \left(\frac{-1}{2x}\right)^{13}$$

$$= \binom{20}{13} (x^2)^7 \left(\frac{-1}{2}\right)^{13} x^{-13}$$
$$= \binom{20}{13} \left(\frac{-1}{2}\right)^{13} x^{-13} x^{14}$$
$$= -^{20}C_{13} x \cdot 2^{-13}$$
$$= -^{20}C_7 x \cdot 2^{-13}$$

31. Question

Mark the correct alternative in the following :

The number of terms with integral coefficients in the expansion of $(17^{1/3} + 35^{1/2}x)^{600}$ is

A.2n

B. 50

C. 150

D. 101

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$
$$\left(17^{\frac{1}{3}} + 35^{\frac{1}{2}}x\right)^{600} = \sum_{k=0}^{600} {600 \choose k} (17^{1/3})^{600-k} (35^{1/2}x)^{k}$$

For integral coefficients; (600-k) should be divisible by 3 and k should be disable bye 2.

It indicates that k should be multiple of 6.

So, the values of k would be = 6,12,18...,594,600

32. Question

Mark the correct alternative in the following :

Constant term in the expansion of $\left(x-\frac{1}{x}\right)^{10}$ is

A.152

B. -152

- C. -252
- D. 252

Answer

Given:

$$(x+a)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} a^k$$

$$\begin{split} & \left(x - \frac{1}{x}\right)^{10} = \sum_{k=0}^{10} {\binom{10}{k}} x^{10-k} {\binom{-1}{x}}^k \\ & = \sum_{k=0}^{10} {\binom{10}{k}} x^{10-k} (-1)^k x^{-k} \end{split}$$
 For constant term,

 $\mathbf{x^{10-k-k}} = \mathbf{x^0}$

10-2k = 0

k = 5

Term = $\binom{10}{5} x^{10-5} (-1)^5 x^{-5}$

= -252

33. Question

Mark the correct alternative in the following :

If the coefficients of x^2 and x^3 in the expansion of $(3 + ax)^9$ are the same, then the value of a is.

A.
$$-\frac{7}{9}$$

B. $-\frac{9}{7}$
C. $\frac{7}{9}$

Answer

Given:

$$(x+a)^{n} = \sum_{k=0}^{n} {n \choose k} x^{n-k} a^{k}$$

$$(3+ax)^9 = \sum_{k=0}^{9} {\binom{9}{k}} 3^{9-k} (ax)^k$$

Coefficient of x^2 ; k=2

$$= \binom{9}{2} 3^{9-2} a^2$$

 $=\binom{9}{2}3^{7}a^{2}(1)$

Coefficient of x^3 ; k=3

$$= \binom{9}{3} 3^{9-3} a^{3}$$
$$= \binom{9}{3} 3^{6} a^{3} (2)$$

Equate both equations;

$$\binom{9}{2}3^7 a^2 = \binom{9}{3}3^6 a^3$$
$$\frac{9!}{2! \times 7!} \times 3 = \frac{9!}{3! \times 6!} a$$
$$\frac{1}{7} \times 3 = \frac{1}{3} a$$
$$\frac{9}{7} = a$$
