# Class XII Session 2025-26 Subject - Psychology Sample Question Paper - 4

Maximum Marks: 70 : 3 hours ictions: Il questions are compulsory except where internal choice has been given. juestion Nos. 1-14 in Section A carry 1 mark each. You are expected to answer them as directed. uestion Nos. 15-19 in Section B are very short answer type-I questions carrying 2 marks each. The answer to ach question should not exceed 30 words. uestion Nos. 20-23 in Section C are short answer type-II questions carrying 3 marks each. The answer to each uestion should not exceed 60 words. uestion Nos. 24 - 27 in Section D are long answer type-I questions carrying 4 marks each. The answer to each uestion should not exceed 120 words. uestion Nos. 28-29 in Section E are long answer type-II questions carrying 6 marks each. The answer to each uestion should not exceed 200 words. uestion Nos. 30–33 in Section F are based on two cases given. The answer to each onemark question should not xceed 20 words. The answer to each two-mark question should not exceed 30 words. Section A viduals with autism spectrum disorder tend to experience difficulties in starting, maintaining and even [1] erstanding relationships. Moreover, ) They are unable to initiate social behaviour b) They are able to share experiences with and seem unresponsive to other people's others. feelings. ) They show wide range of interests and d) About 90 per cent of children with autism repetitive behaviours. spectrum disorder do not have intellectual disabilities. special relationship between the client and the therapist is known as the \_\_\_\_\_ [1] b) Unconditional positive regard ) Interpersonal relationship ) Therapeutic relationship d) Trust bond

nosed?		
	·	

Stress is subjective - not measurable with tests. Only the person experiencing it can determine whether is it present and how severe it feels. A healthcare provider may use questionnaires to understand your stress and how it affects your life. If you have chronic stress, your healthcare provider can evaluate symptoms that result from stress. For example, high blood pressure can be diagnosed and treated. When we're stressed, the immune system's ability to fight off antigens is reduced. That is why we are more susceptible to infections. The stress hormone cortisol can suppress the effectiveness of the immune system (e.g. lowers the number of lymphocytes). Stress can also have an indirect effect on the immune system as a person may use unhealthy behavioral coping strategies to reduce their stress, such as drinking and smoking. Stress is linked to headaches; infectious illness (e.g. 'flu); cardiovascular disease; diabetes, asthma, and gastric ulcers. Coping is a dynamic situation-specific reaction to stress. Endler and Parker gave some major coping strategies. The way we cope with stress often depends on rigid deep-seated beliefs, based on experience.

- 30. What is Biofeedback? (1)
- 31. What is Hypothalamus? What does it do? (2)

# Question No. 32 to 33 are based on the given text. Read the text carefully and answer the questions:

[3]

Multiple intelligences is a theory developed by Harvard psychologist Howard Gardner in 1983. The theory suggests that there are eight different types of intelligence:

Linguistic, Logical-mathematical, Spatial, Bodily-kinesthetic, Musical, Interpersonal, Intrapersonal, Naturalistic.

The theory posits that individuals possess various distinct types of intelligence, rather than a single general intelligence.

These types encompass areas like:

- The use of words, numbers, pictures, and music
- The importance of social interactions, introspection, physical movement, and being in tune with nature

The theory describes the different ways students learn and acquire information. For example, children with musical intelligence learn well through songs, patterns, rhythms, instruments, and musical expression.

- 32. Which type of intelligence involves skills in scientific thinking and problem-solving? (1)
- 33. What is the importance of the theory of multiple intelligences? (2)

# **Solution**

# Section A

ney are unable to initiate social behaviour and seem unresponsive to other people's feelings.  unation:
are unable to initiate social behaviour and seem unresponsive to other people's feelings.
nerapeutic relationship nation: peutic relationship
feriority  nation: rding to social learning theorists, the theories of classical conditioning (Pavlov), instrumental conditioning (Skinner), and vational learning (Bandura) and modelling are the behavioural approach of learning.
of these mation: these
nange mation: ge is not the personality trait of hardiness. There are three personality traits of hardiness which are also referred to as three hich are control, commitment, and challenge.
is true but R is false.  mation:  ness is a set of beliefs about oneself, the world, and how they interact. People with high levels of stress and low levels of ses share three characteristics which are referred to as the personality traits of hardiness. It takes shape as a sense of nal commitment to what you are doing, a sense of control over your life, and a feeling of challenge.
ising levels of endorphins  mation:  ise can provide an active outlet for the physiological arousal experienced in response to stress (by raising levels of phins). Regular exercise improves the efficiency of the heart, enhances the function of the lungs, maintains good ation, lowers blood pressure, reduces fat in the blood, and improves the body's immune system. Swimming, walking, 19, cycling, skipping, etc. help to reduce stress.

ontrol

# ınation:

ion of control: False belief that another person, group of people, or external force controls one's general thoughts, gs, impulses, or behavior. It is a kind of psychotic disorder.

aintaining factors

#### ınation:

aining factors

apegoating

#### ination:

goating is a group based way of expressing frustration and often results in negative attitudes or prejudice against the er group.

ffective

#### ination:

tive

oth A and R are true and R is the correct explanation of A.

#### ination:

/ay we perceive ourselves and the ideas we hold about our competencies and attributes is called self-concept. We base it e ways others react and respond to us.

rowd

### ınation:

people in a large group make up a crowd. A crowd of people might gather for a party, concert, or demonstration, ing that there's something a little disorderly and irrational and no feeling of belongingness.

## Section B

eme cohesiveness of a group is not always in the group's interest. While cohesiveness can promote unity and ation, it may also lead to groupthink, where critical thinking and diverse perspectives are suppressed, potentially hindering decision-making and innovation.

ogical Assessment uses **systematic testing procedures** to evaluate the abilities, behaviours and personal qualities of als. Our assessment may be formal or informal.

**assessment** is objective, standardized and organized. **Informal assessment** varies from case to case and from one ent to another and therefore is open to subjective interpretations.

OR

is a combination of characteristics indicative of an individuals potential to acquire some specific skills with training. For , possession of certain qualities in different proportions to become a dancer or a computer programmer. It is individual lity.

allic stage, **Freud** speculated that at this time the child **fraternizes sexual relations with parents of the opposite sex** reud termed as the **Oedipus complex** for boys and **Electra complex** for girls.

child experiencing the Oedipus complex tends to get **sexually attracted toward** his mother and his hostility toward his hey come to know this is unlikely, boys give up their sexual feelings for their mother and start to see their fathers as **role** 

of hostility toward their mother. Later on, girls when realising that this is highly unlikely then they give up their sexual ud start seeing their mother as a role model.

s is a basic ingredient of life.

biological system is equipped with some stress alarms that are essential for survival and allow one to function effectively any situations.

out undergoing stress, there can be no constructive and creative activity.

example, a certain level of stress is necessary to perform better in examinations.

**influences**, the real presence of people is essential. These are social facilitation, social loafing, and group polarization; in **social influences**, the presence of people may be real or imaginary. There are three important group influence s, i.e. conformity, compliance, and obedience.

#### **Section C**

al therapy is a form of psychotherapy that focuses on helping individuals find meaning and purpose in life, which can ntly reduce psychological distress.

**ng Existential Concerns:** Existential therapy encourages individuals to confront fundamental questions about existence. Essing these existential concerns, individuals can gain a deeper understanding of their own values and beliefs, which helps d personal meaning.

**izing Personal Responsibility:** This therapy emphasizes the importance of personal responsibility and the role of all choices in shaping one's life. By recognizing that they have the freedom to make choices, individuals can feel more red and less helpless.

**g Authenticity:** Existential therapy encourages individuals to live authentically, in alignment with their true selves. uthentically can lead to a more fulfilling and meaningful life, reducing feelings of emptiness and despair.

**ing Isolation and Connection:** One of the core aspects of existential therapy is addressing feelings of isolation and a sense of connection with others. By exploring relationships and the human condition, individuals can develop a greater belonging and interconnectedness, which can mitigate feelings of loneliness and existential angst.

**Iting Anxiety and Fear:** Existential therapy helps individuals confront and accept the inherent anxieties of life, such as of death or the uncertainty of the future. By facing these fears directly, individuals can reduce their psychological distress alop a more resilient mindset.

1 disorder involves both Mania and depression alternatively with intervals of normal episodes.

disorder is cyclic in nature. Earlier it was called Manic depressive disorder.

ng Mania phase, a patient shows symptom of Mania while in depressive state patient manifest symptoms of depression. esteem is a cognitive component of self.

value judgment of a person about herself/himself is called self-esteem.

n be high or low. To assess it, we present a variety of statements to a person and ask him to indicate the extent to which are true for him. e.g., we may ask a child to what extent the statement "I am good at homework" or "I am highly liked by eers" is true. If he responds as them to be true, he will have high self-esteem than someone who says "no".

OR

ording to Freud, approachable personality is biologically oriented whereas **Erich Fromm's** theory of personality has a ll orientation.

iewed human beings basically as social beings.

nim, personality traits develop due to social interaction whereas, according to **Freud**, the roots of personality development n innate tendencies and unconscious desires.

ructure refers to the way in which a group is organized, including the roles, norms, and relationships that shape the and interactions of its members. Here are the three key elements of group structure:

**Definition**: Roles refer to the expected behavior patterns attributed to individuals occupying specific positions within a group. Each role comes with a set of responsibilities and expectations.

**Examples**: In a classroom setting, a teacher has the role of instructor and leader, while students have the role of learners.

**Definition:** Norms are the shared rules and expectations about how members of the group should behave. They provide guidelines for acceptable behavior and help maintain order and cohesion within the group.

#### nember Relations

**Definition**: Intermember relations refer to the patterns of relationships and interactions among group members. These elations determine the social dynamics and influence within the group.

**Examples:** In a project team, intermember relations might include mentorship, collaboration, and peer support.

#### Section D

e therapy is a type of psychotherapy that focuses on changing a person's thinking. This is based on the assumption that ghts influence our feelings. Unlike other forms of psychotherapy such as psychoanalysis, cognitive therapy focuses on the ather than events of the past. Cognitive therapies suggest that dwelling on self-blaming or self-deprecating thoughts feeds on and prolongs negative thinking. Since we think with words, changing how a person talk to themselves can help reshape lking and thereby their functioning.

Ellis: Albert Ellis's rational-emotive behaviour therapy (REBT) set the framework for cognitive therapies. Ellis found that soften arise due to irrational thinking. He used a confrontational approach to therapy that challenged people's illogical ions and self-defeating attitudes. He found that people often assume that their emotions are caused by an event rather than iking. Therefore, in REBT, therapists regularly use a technique called "disputing" in which they work to help the client nat their thoughts are the cause of their depression, not the event itself.

nple: Someone may believe their depression was caused by them failing a test. However, Ellis would challenge this by pointing out that if that event were the cause of depression, then everyone who failed a test would get depressed. t all people struggle with depression after failing a test, that person must consider that their thoughts (such as "I'll never enough") are the true cause of their distress, not the event itself.

**leck's Cognitive Therapy for Depression:** While some credit Ellis as the first to develop cognitive therapy, others cite eck for initially using the technique to treat individuals with depression. While doing so, he realized that there is a tic benefit to challenging a person's harmful automatic thought patterns. He sought to help clients reverse their negativity themselves, their situations, and their futures.

ognitive therapies are used to treat several mental health conditions other than depression including anxiety, post-c stress disorder (PTSD), obsessive-compulsive disorder (OCD), bipolar disorder, eating disorders, panic attacks, 1, and anger. They are not only helpful in treating mental health conditions but also in supporting people through life es such as chronic illness, low self-esteem, grief or loss, stress, or guilt.

OR

g symptoms and raising functioning or quality of life are the two main goals of treating psychological disorders. In the nilder diseases like reactive depression, phobia, or generalized anxiety, a decrease in symptoms is associated with an ment in quality of life. However, a patient's symptoms may lessen without necessarily improving in severe mental s like schizophrenia. Negative symptoms in these individuals include apathy or a lack of drive, as well as a decline in their e, social, and occupational abilities. They need rehabilitation so badly. tation entails the following steps:

**ipational Therapy:** Patients are taught techniques such as weaving, making paper bags, and making candles to help them lop work discipline.

**al Skill Training:** Patients' interpersonal skills are developed through role-playing, imitation, and instruction. **nitive Retraining:** It helps patients improve their basic cognitive abilities, such as executive memory and attention tions.

**itional Training:** Following the patient's ability to support themselves, vocational training is provided to assist the patient veloping the skills required to find gainful employment.

nce tests serve many useful purposes if used by trained professionals.

Intelligence Test: Intelligence test assists in selection, counselling, guidance, self-analysis and diagnosis.

of Intelligence Test: Intelligence test causes ill effects/misuses/abuses if used by naive testers.

performance on a test is a stigma to children which affects adversely the performance.

results may lead to discriminating practices from parents, teachers and elders.

t of the intelligence tests favour the middle class and higher class populations because of cultural bias.

t intelligence tests ignore creativity and practical aspects of life.

r Features of attitude are:

**plicity or Complexity:** It refers to how many attitudes are there in a broader attitude. Attitude is simple if it contains a attitudes and complex if it is made up of many attitudes. e.g. attitude towards student's tutor is simple and attitude towards ather is complex.

**trality:** It refers to the role of a particular attitude that influences the other attitudes in the system, e.g., attitude towards ation. Positive attitude towards education influences various other attitudes, e.g., attitude towards knowledge or attitude rds work.

tivity refers to the ability to thinks in novel and unusual ways and to come up with unique solutions to problems. tivity is reality-oriented, appropriate, constructive and socially desirable.

ridual's vary in terms of the level and the areas in which they exhibit creativity.

be related to simple occupations and may be higher levels i.e., related to the artists, the scientists, the inventors, etc., ever, they are not working at the same level.

tivity may be doing things differently. It is working on what has already been done earlier by way of modifications, by ng things in new perspectives or to new use.

determined by both heredity and environment. Limits of creative potential are set by heredity. Environmental factors alate the development, e.g., Motivations, commitment, family support, peer influences, opportunities, etc.

#### Section E

**I.J. Eysenc**k proposed that personality could be reduced to two dimensions.

These dimensions are presumed to be biologically and genetically based.

They are opposed to each other. These dimensions include numerous specific traits.

# These dimensions are as follows:

# cism vs. Emotional Stability:

t refers to the degree to which people have control over their feelings.

At one extreme of this dimension are highly neurotic people.

They are anxious, moody, touchy, restless and quickly lose control.

'eople, who are calm, even-tempered, reliable and remain under control, occupy the other extreme.

#### rsion vs. Introversion:

t refers to the extent to which people are socially outgoing or socially withdrawn.

At one extreme are those who are active, gregarious, impulsive and thrill-seeking.

At other extremes are the people who are passive, quiet, cautious and reserved.

Psychoticism vs. Sociability: A third dimension was developed by Eysenck later. This dimension results due to
interaction with the above-mentioned two dimensions. A person who scores high on the psychoticism dimension
tends to be hostile, ego-centric and anti-social.

Sociability refers to the tendency of an individual to follow social norms.

OR

desire to become a musician and fulfill his potential, despite belonging to a family of doctors, can be understood through gers' perspective of self-actualization and congruence.

ialization refers to the inherent drive in individuals to reach their full potential and become the best version of themselves. pursuit of music indicates his recognition of his true passions and talents, and his determination to follow a path that ith his authentic self. He is seeking personal growth and self-fulfillment by choosing a career that resonates with his st desires.

nce, another concept from Rogers' theory, refers to the alignment between one's self-concept and actual experience. decision to pursue music, despite societal and familial expectations, demonstrates his congruence between his self-as a musician and his actions in choosing that path. He is being true to himself and rejecting any incongruence between ity and external pressures.

nore, Anand's choice reflects his need for positive regard and acceptance from others. According to Rogers, individuals indamental need for unconditional positive regard, which involves being valued and accepted for who they truly are. pursuit of his musical aspirations may require understanding and support from his family and friends to validate his eath and provide the necessary encouragement.

ary, Anand's desire to become a musician and fulfill his potential demonstrates his pursuit of self-actualization, are between his self-concept and actions, and the need for positive regard. He exemplifies Rogers' belief in individuals

- The word 'Abnormal' literally means away from the normal. It implies a deviation from some clearly defined norms or standards.
- Various Views to explain Abnormality:

### i. Abnormality as Deviation from Social Norms:

- a. Each society has social norms, which are stated or unstated rules for proper conduct. Behaviours, thoughts, and emotions that break societal norms are called **abnormal**.
- b. Behaviour violates social norms or threatens or makes anxious those observing it. Violation of norms makes abnormality a relative concept; various forms of unusual behavioural can be tolerated depending on the prevailing cultural norms. Yet this component is also at once too broad and too narrow.

## ii. Abnormality in terms of Maladaptive Behaviour:

- a. The recent approach views abnormal behaviour as **maladaptive.** Many psychologists believe that the best criterion for determining the normality of behaviour is not whether society accepts it but whether it **facilitates the well-being of the individual** and eventually of the group to which he/she belongs.
- b. Well-being is not simply maintenance and survival but also includes **growth** and fulfilment. Maladaptive behaviour refers to Behaviour that causes problems in life.
- iii. **Concept of four D's:** Now-a-days many psychologists believe that if an individual's behaviour manifests significant deviance, distress, danger, and dysfunction in his/ her behavioural pattern, then it should be treated as abnormal.

OR

Psychological disorders are diagnosed on the basis of two classifications, i.e., DSM or IV ICD-10.

- i. Classification of psychological disorders consists of a list of categories of specific psychological disorders grouped into various classes on the basis of some shared characteristics.
- ii. International Classification of Diseases (ICD-10) is a classification of behavioral and mental disorders.
- iii. ICD-10 refers to the international classification of diseases and its 10th revision is being used.
- iv. It is developed by **WHO** under one broad heading 'Mental Disorders' which is based on symptoms. (The classification scheme is officially used in India)
- v. The **American Psychiatric Association (APA)** has published an official manual of psychological disorders: The Diagnostic and Statistical Manual of Mental Disorders, Vth Edition (DSM-V).
- vi. It Evaluates the patient on five axes or dimensions rather than just one broad aspect of 'mental disorder'.
- vii. These dimensions relate to biological, psychological, social and other aspects.

# **Uses of Classification:**

- i. Classifications are useful because they enable psychologists, psychiatrists and social workers to communicate with each other about the disorders.
- ii. Helps in understanding the causes of psychological disorders and the processes involved in their development.
- iii. It helps in Clinical diagnosis.

#### Section F

- 30. Biofeedback is a procedure to monitor and reduce the physiological aspects of stress and is accompanied by relaxation techniques.
- 31. The hypothalamus is a structure deep in our brain, that acts as our body's smart control coordinating center. Its main function is to keep our body in a stable state called homeostasis.
- 32. Logical-mathematical intelligence involves skills in scientific thinking and problem-solving.
- 33. The theory of multiple intelligences is important because it **allows us to think about different types of mental strengths and abilities**. Learning more about which types of intelligence you lean towards may help you learn to recognize your own preferences.
