#### 5.2 Classical thermodynamics

#### Thermodynamic laws

| Thermodynamic temperature <sup>a</sup> | $T \propto \lim_{p \to 0} (pV)$                                                | (5.1) | T thermodynamic temperature V volume of a fixed mass of gas p gas pressure         |
|----------------------------------------|--------------------------------------------------------------------------------|-------|------------------------------------------------------------------------------------|
| Kelvin<br>temperature scale            | $T/K = 273.16 \frac{\lim_{p \to 0} (pV)_T}{\lim_{p \to 0} (pV)_{tr}}$          | (5.2) | K kelvin unit tr temperature of the triple point of water                          |
| First law <sup>b</sup>                 | $\mathrm{d}U = \mathrm{d}Q + \mathrm{d}W$                                      | (5.3) | dU change in internal energy $dW$ work done on system $dQ$ heat supplied to system |
| Entropy <sup>c</sup>                   | $\mathrm{d}S = \frac{\mathrm{d}Q_{\mathrm{rev}}}{T} \ge \frac{\mathrm{d}Q}{T}$ | (5.4) | S experimental entropy T temperature rev reversible change                         |

<sup>&</sup>lt;sup>a</sup>As determined with a gas thermometer. The idea of temperature is associated with the zeroth law of thermodynamics: If two systems are in thermal equilibrium with a third, they are also in thermal equilibrium with each other.

#### Thermodynamic work<sup>a</sup>

| Hydrostatic pressure | dW = -p dV                                                  | (5.5) | p (hydrostatic) pressure $dV$ volume change                                         |
|----------------------|-------------------------------------------------------------|-------|-------------------------------------------------------------------------------------|
| Surface tension      | $dW = \gamma dA$                                            | (5.6) | dW work done on the system<br>$\gamma$ surface tension $dA$ change in area          |
| Electric field       | $\bar{\mathbf{d}}W = \mathbf{E} \cdot \mathbf{d}\mathbf{p}$ | (5.7) | <ul><li>E electric field</li><li>dp induced electric dipole moment</li></ul>        |
| Magnetic field       | $dW = \mathbf{B} \cdot d\mathbf{m}$                         | (5.8) | <ul><li>B magnetic flux density</li><li>dm induced magnetic dipole moment</li></ul> |
| Electric current     | $dW = \Delta \phi dq$                                       | (5.9) | $\Delta \phi$ potential difference d $q$ charge moved                               |

<sup>&</sup>lt;sup>a</sup>The sources of electric and magnetic fields are taken as being outside the thermodynamic system on which they are working.

<sup>&</sup>lt;sup>b</sup>The d notation represents a differential change in a quantity that is not a function of state of the system.

<sup>&</sup>lt;sup>c</sup>Associated with the second law of thermodynamics: No process is possible with the sole effect of completely converting heat into work (Kelvin statement).

#### Cycle efficiencies (thermodynamic)<sup>a</sup>

| Heat engine             | $\eta = \frac{\text{work extracted}}{\text{heat input}} \le \frac{T_{\text{h}} - T_{\text{l}}}{T_{\text{h}}}$ | (5.10) | $\eta$ efficiency $T_{\rm h}$ higher temperature $T_{\rm l}$ lower temperature           |
|-------------------------|---------------------------------------------------------------------------------------------------------------|--------|------------------------------------------------------------------------------------------|
| Refrigerator            | $ \eta = \frac{\text{heat extracted}}{\text{work done}} \le \frac{T_1}{T_h - T_1} $                           | (5.11) |                                                                                          |
| Heat pump               | $ \eta = \frac{\text{heat supplied}}{\text{work done}} \le \frac{T_{\text{h}}}{T_{\text{h}} - T_{\text{l}}} $ | (5.12) |                                                                                          |
| Otto cycle <sup>b</sup> | $ \eta = \frac{\text{work extracted}}{\text{heat input}} = 1 - \left(\frac{V_2}{V_1}\right)^{\gamma - 1} $    | (5.13) | $\frac{V_1}{V_2}$ compression ratio $\gamma$ ratio of heat capacities (assumed constant) |

<sup>&</sup>lt;sup>a</sup>The equalities are for reversible cycles, such as Carnot cycles, operating between temperatures  $T_h$  and  $T_l$ . <sup>b</sup>Idealised reversible "petrol" (heat) engine.

# Heat capacities

| Constant volume               | $C_V = \frac{dQ}{dT}\Big _V = \frac{\partial U}{\partial T}\Big _V = T \frac{\partial S}{\partial T}\Big _V$                                            | (5.14)           | $egin{array}{cccc} C_V & 	ext{heat capacity, $V$ constant} \\ Q & 	ext{heat} \\ T & 	ext{temperature} \\ V & 	ext{volume} \\ U & 	ext{internal energy} \\ \end{array}$ |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Constant pressure             | $C_p = \frac{\partial Q}{\partial T}\Big _p = \frac{\partial H}{\partial T}\Big _p = T\frac{\partial S}{\partial T}\Big _p$                             |                  | H enthalpy                                                                                                                                                             |
| Difference in heat capacities | $C_{p} - C_{V} = \left(\frac{\partial U}{\partial V}\Big _{T} + p\right) \frac{\partial V}{\partial T}\Big _{p}$ $= \frac{VT\beta_{p}^{2}}{\kappa_{T}}$ | (5.16)<br>(5.17) | $\beta_p$ isobaric expansivity $\kappa_T$ isothermal compressibility                                                                                                   |
| Ratio of heat capacities      | $\gamma = \frac{C_p}{C_V} = \frac{\kappa_T}{\kappa_S}$                                                                                                  | (5.18)           | $\gamma$ ratio of heat capacities $\kappa_S$ adiabatic compressibility                                                                                                 |

## Thermodynamic coefficients

| Isobaric expansivity <sup>a</sup> | $\beta_p = \frac{1}{V} \frac{\partial V}{\partial T} \Big _p$         | (5.19) | $\beta_p$ isobaric expansivity  V volume  T temperature |
|-----------------------------------|-----------------------------------------------------------------------|--------|---------------------------------------------------------|
| Isothermal compressibility        | $\kappa_T = -\frac{1}{V} \frac{\partial V}{\partial p} \Big _T$       | (5.20) | $\kappa_T$ isothermal compressibility $p$ pressure      |
| Adiabatic compressibility         | $\kappa_S = -\frac{1}{V} \frac{\partial V}{\partial p} \Big _S$       | (5.21) | $\kappa_S$ adiabatic compressibility                    |
| Isothermal bulk modulus           | $K_T = \frac{1}{\kappa_T} = -V \frac{\partial p}{\partial V} \Big _T$ | (5.22) | $K_T$ isothermal bulk modulus                           |
| Adiabatic bulk modulus            | $K_S = \frac{1}{\kappa_S} = -V \frac{\partial p}{\partial V} \Big _S$ | (5.23) | $K_S$ adiabatic bulk modulus                            |

<sup>&</sup>lt;sup>a</sup>Also called "cubic expansivity" or "volume expansivity." The linear expansivity is  $\alpha_p = \beta_p/3$ .

#### **Expansion processes**

|                        | $\partial T + T^2 \partial (n/T) +$                                                                             |        | η Joule coefficient               |
|------------------------|-----------------------------------------------------------------------------------------------------------------|--------|-----------------------------------|
| Joule                  | $ \eta = \frac{\partial T}{\partial V}\Big _{U} = -\frac{T^2}{C_V} \frac{\partial (p/T)}{\partial T}\Big _{V} $ | (5.24) | T temperature                     |
| expansion <sup>a</sup> | •                                                                                                               |        | p pressure                        |
| Capansion              | $=-\frac{1}{C_V}\left(T\frac{\partial p}{\partial T}\Big _V-p\right)$                                           | (5.25) | U internal energy                 |
|                        | $C_V \setminus \partial T   V^{-1}$                                                                             | ` ,    | $C_V$ heat capacity, $V$ constant |
|                        | $\partial T \mid T^2 \partial (V/T) \mid$                                                                       | (5.26) | μ Joule–Kelvin coefficient        |
| Joule-Kelvin           | $\mu = \frac{\partial T}{\partial p}\Big _{H} = \frac{T^{2}}{C_{p}} \frac{\partial (V/T)}{\partial T}\Big _{p}$ | (5.26) | V volume                          |
| expansion <sup>b</sup> |                                                                                                                 | (5.05) | H enthalpy                        |
|                        | $= \frac{1}{C_p} \left( T \frac{\partial V}{\partial T} \Big _p - V \right)$                                    | (5.27) | $C_p$ heat capacity, $p$ constant |

<sup>&</sup>lt;sup>a</sup>Expansion with no change in internal energy.

### Thermodynamic potentials $^a$

| Internal energy                    | $dU = T dS - p dV + \mu dN$                                        | (5.28)                     | U<br>Τ<br>S<br>μ<br>N | internal energy temperature entropy chemical potential number of particles |
|------------------------------------|--------------------------------------------------------------------|----------------------------|-----------------------|----------------------------------------------------------------------------|
| Enthalpy                           | $H = U + pV$ $dH = T dS + V dp + \mu dN$                           | (5.29)<br>(5.30)           | H<br>p<br>V           | enthalpy<br>pressure<br>volume                                             |
| Helmholtz free energy <sup>b</sup> | $F = U - TS$ $dF = -S dT - p dV + \mu dN$                          | (5.31)<br>(5.32)           | F                     | Helmholtz free energy                                                      |
| Gibbs free energy <sup>c</sup>     | $G = U - TS + pV$ $= F + pV = H - TS$ $dG = -S dT + V dp + \mu dN$ | (5.33)<br>(5.34)<br>(5.35) | G                     | Gibbs free energy                                                          |
| Grand potential                    | $\Phi = F - \mu N$ $d\Phi = -S dT - p dV - N d\mu$                 | (5.36)<br>(5.37)           | Φ                     | grand potential                                                            |
| Gibbs-Duhem relation               | $-S\mathrm{d}T + V\mathrm{d}p - N\mathrm{d}\mu = 0$                | (5.38)                     |                       |                                                                            |
| Availability                       | $A = U - T_0 S + p_0 V$<br>$dA = (T - T_0) dS - (p - p_0) dV$      | (5.39)<br>(5.40)           | $A$ $T_0$ $p_0$       | availability<br>temperature of<br>surroundings<br>pressure of surroundings |

a dN=0 for a closed system.

<sup>&</sup>lt;sup>b</sup>Expansion with no change in enthalpy. Also known as a "Joule-Thomson expansion" or "throttling" process.

bSometimes called the "work function." cSometimes called the "thermodynamic potential."

#### Maxwell's relations

|           | $\partial T \mid \partial p \mid (\partial^2 U)$                                                                                                          |        | U | internal energy       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|--------|---|-----------------------|

<sup>&</sup>lt;sup>a</sup>Phase boundary gradient for a first-order transition. Equation (5.50) is sometimes called the "Clapeyron equation." <sup>b</sup> For  $V_2 \gg V_1$ , e.g., if phase 1 is a liquid and phase 2 a vapour. <sup>c</sup> For a second-order phase transition.
