

2. Differentiation

- Suppose f is a real function and c is a point in its domain. Then, the derivative of f at c is defined by,

$$f'(c) = \lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$$

- Derivative of a function $f(x)$, denoted by $\frac{d}{dx}(f(x))$ or $f'(x)$, is defined by $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

Example:

Find derivative of $\sin 2x$.

Solution:

Let $f(x) = \sin 2x$

$$\begin{aligned} \therefore f'(x) &= \lim_{h \rightarrow 0} \frac{\sin 2(x+h) - \sin 2x}{h} \\ &= \lim_{h \rightarrow 0} \frac{2 \cos(2x+h) \cdot \sin h}{h} \\ &= 2 \lim_{h \rightarrow 0} \cos(2x+h) \cdot \lim_{h \rightarrow 0} \frac{\sin h}{h} \\ &= 2 \times \cos 2x \times 1 \\ &= 2 \cos 2x \end{aligned}$$

- For two functions f and g , the rules of algebra of derivatives are as follows:

- $(f+g)' = f' + g'$
- $(f-g)' = f' - g'$
- $(fg)' = f'g' \quad [\text{Leibnitz or product rule}]$
- $\left(\frac{f}{g}\right)' = \frac{f'g - fg'}{g^2}$, where $g \neq 0$ [Quotient rule]

- Every differentiable function is continuous, but the converse is not true.

Example:

$f(x) = |x|$ is continuous at all points on real line, but it is not differentiable at $x = 0$.

$$\text{Since L.H.S } = \lim_{h \rightarrow 0^-} \frac{f(0+h) - f(0)}{h} = \frac{-h}{h} = -1$$

$$= \lim_{h \rightarrow 0^+} \frac{f(0+h) - f(0)}{h} = \frac{h}{h} = 1$$

R.H.S

$\therefore \text{L.H.S} \neq \text{R.H.S.}$

Therefore, $f'(x)$ does not exist at $x = 0$; i.e., f is not differentiable at $x = 0$.

The derivatives of some useful functions are as follows:

$$\begin{aligned} \circ \frac{d}{dx} (\sin^{-1} x) &= \frac{1}{\sqrt{1-x^2}} \\ \circ \frac{d}{dx} (\cos^{-1} x) &= \frac{-1}{\sqrt{1-x^2}} \end{aligned}$$

$$\begin{aligned}
\circ \quad \frac{d}{dx}(\tan^{-1} x) &= \frac{1}{1+x^2} \\
\circ \quad \frac{d}{dx}(\cot^{-1} x) &= \frac{-1}{1+x^2} \\
\circ \quad \frac{d}{dx}(\sec^{-1} x) &= \frac{1}{x\sqrt{x^2-1}} \\
\circ \quad \frac{d}{dx}(\operatorname{cosec}^{-1} x) &= \frac{-1}{x\sqrt{x^2-1}}
\end{aligned}$$

- **Chain rule:** This rule is used to find the derivative of a composite function. Let $f = v \circ u$. Suppose $t = u(x)$; and if both $\frac{dt}{dx}$ and $\frac{dv}{dt}$ exist, then $\frac{df}{dx} = \frac{dv}{dt} \cdot \frac{dt}{dx}$

Similarly, if $f = (w \circ u) \circ v$, and if $t = v(x)$, $s = u(t)$, then $\frac{df}{dx} = \frac{d(w \circ u)}{ds} \cdot \frac{ds}{dt} \cdot \frac{dt}{dx} = \frac{dw}{ds} \cdot \frac{ds}{dt} \cdot \frac{dt}{dx}$

Example: Find the derivative of $\sin^2(\log x + \cos^2 x)$.

Solution:

$$\begin{aligned}
\frac{d}{dx} \left[\sin^2(\log x + \cos^2 x) \right] &= 2\sin(\log x + \cos^2 x) \times \frac{d}{dx} \left[\sin(\log x + \cos^2 x) \right] \\
&= 2\sin(\log x + \cos^2 x) \cdot \cos(\log x + \cos^2 x) \times \frac{d}{dx} (\log x + \cos^2 x) \\
&= \sin 2(\log x + \cos^2 x) \cdot \left[\frac{1}{x} + 2\cos x \times \frac{d}{dx}(\cos x) \right] \\
&= \sin(\log x^2 + 2\cos^2 x) \times \left(\frac{1}{x} - 2\sin x \cos x \right) \\
&= \left(\frac{1}{x} - \sin 2x \right) \sin(\log x^2 + 2\cos^2 x)
\end{aligned}$$

- Derivative of a function $f(x) = [u(x)]^{v(x)}$ can be calculated by taking logarithm on both the sides, i.e. $\log f(x) = v(x) \log [u(x)]$, and then differentiating both sides with respect to x .

Example: If $y = x^{x^x}$, find $\frac{dy}{dx}$

Solution:

Let $y = x^{x^x} = x^y$

$$\therefore \log y = y \log x$$

$$\Rightarrow \frac{d}{dx}(\log y) = \frac{d}{dx}(y \log x)$$

$$\Rightarrow \frac{1}{y} \frac{dy}{dx} = \frac{dy}{dx} \log x + \frac{y}{x}$$

$$\Rightarrow \frac{dy}{dx} \left[\frac{1}{y} - \log x \right] = \frac{y}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\frac{y}{x}}{\frac{1}{y} - \log x} = \frac{y^2}{x - y \log x}$$

- If the variables x and y are expressed in the form of $x = f(t)$ and $y = g(t)$, then they are said to be in parametric form. In this case, $\frac{dy}{dx} = \frac{dy}{dt} \times \frac{dt}{dx} = \frac{g'(t)}{f'(t)}$, provided $f'(t) \neq 0$

- If $y = f(x)$, then $\frac{dy}{dx} = f'(x)$ and $\frac{d^2y}{dx^2}$ or $f''(x) = \frac{d}{dx} \left(\frac{dy}{dx} \right)$

Here, $f''(x)$ or $\frac{d^2y}{dx^2}$ is called the second order derivative of y with respect to x .
