## 3. Trigonometric Functions of Compound Angles

**Trigonometric identities and formulas:** 

igonometric identities and formulas:  

$$\cos \operatorname{cc} x = \frac{1}{\sin x}$$

$$\operatorname{sec} x = \frac{1}{\cos x}$$

$$\operatorname{tan} x = \frac{\sin x}{\cos x}$$

$$\operatorname{cot} x = \frac{1}{\tan x} = \frac{\cos x}{\sin x}$$

$$\operatorname{cos}^2 x + \sin^2 x = 1$$

$$\operatorname{o} 1 + \tan^2 x = \sec^2 x$$

$$\operatorname{o} 1 + \cot^2 x = \csc^2 x$$

$$\operatorname{o} (2n\pi + x) = \cos x, n \in \mathbb{Z}$$

$$\operatorname{o} \sin (2n\pi + x) = \sin x, n \in \mathbb{Z}$$

$$\operatorname{o} \sin (2n\pi + x) = \sin x, n \in \mathbb{Z}$$

$$\operatorname{o} \sin (2n\pi + x) = \sin x$$

$$\operatorname{o} \cos (x + y) = \cos x \cos y - \sin x \sin y$$

$$\operatorname{cos} (x + y) = \cos x \cos y + \sin x \sin y$$

$$\operatorname{cos} (x - y) = \cos x \cos y + \sin x \sin y$$

$$\operatorname{cos} (\frac{\pi}{2} - x) = \sin x$$

$$\operatorname{o} \sin (x + y) = \sin x \cos y + \cos x \sin y$$

$$\operatorname{o} \sin (x - y) = \sin x \cos y - \cos x \sin y$$

$$\operatorname{cos} (\frac{\pi}{2} + x) = -\sin x$$

$$\operatorname{o} \cos (\pi - x) = -\cos x$$

$$\operatorname{o} \sin (\pi - x) = \sin x$$

$$\operatorname{cos} (\pi + x) = -\sin x$$

$$\operatorname{cos} (2\pi - x) = \cos x$$

 $\circ \sin(2\pi - x) = -\sin x$ • If none of the angles x, y and  $(x \pm y)$  is an odd multiple of  $\frac{\pi}{2}$ , then

$$\tan(x+y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}$$
, and  $\tan(x-y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}$ 

• If none of the angles x, y and  $(x \pm y)$  is a multiple of  $\pi$ , then  $\cot(x + y) = \frac{\cot x \cot y - 1}{\cot y + \cos x}$ , and  $\cot(x - y) = \frac{\cot x \cot y + 1}{\cot y - \cot x}$ 

$$\cos 2x = \cos^2 x - \sin^2 x = 2\cos^2 x - 1 = 1 - 2\sin^2 x = \frac{1 - \tan^2 x}{1 + \tan^2 x}$$
• In particular,  $\cos x = \cos^2 \frac{x}{2} - \sin^2 \frac{x}{2} = 2\cos^2 \frac{x}{2} - 1 = 1 - 2\sin^2 \frac{x}{2} = \frac{1 - \tan^2 \frac{x}{2}}{1 + \tan^2 \frac{x}{2}}$ 

$$\circ \sin 2x = 2\sin x \cos x = \frac{2\tan x}{1 + \tan^2 x}$$

• In particular, 
$$\sin x = 2\sin\frac{x}{2}\cos\frac{x}{2} = \frac{2\tan\frac{x}{2}}{1+\tan^2\frac{x}{2}}$$

$$o tan 2x = \frac{2 tan x}{1 - tan^2 x}$$

• In particular,
