	(d)		What is operator overloading with methods? Illustrate with the help of an example using a python code.	2

	Ans		Operator overloading is an ability to use an operator in more than one form.

			In the following example operator + is used for finding the sum of two integers:
			`a = 7`
			`b = 5`
			`print(a+b)  # gives the output: 12`
			Whereas in the next example, shown below the same + operator is used to add two strings:
			`a = 'Indian '`
			`b = 'Government'`
			`print(a+b) #gives the output: Indian Government`
