SENIOR SCHOOL CERTIFICATE EXAMINATION MARCH-2015

MARKING SCHEME – ECONOMICS (FOREIGN) (SET-III)

Expected Answers / Value Points

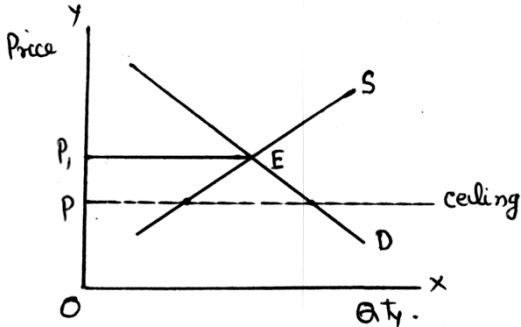

GENERAL INSTRUCTIONS :

1. Please examine each part of a question carefully and allocate the marks allotted for the part as given in the marking scheme below. TOTAL MARKS FOR ANY ANSWER MAY BE PUT IN A CIRCLE ON THE LEFT SIDE WHERE THE ANSWER ENDS.
2. Expected suggested answers have been given in the Marking Scheme. To evaluate the answers the value points indicated in the marking scheme be followed.
3. For questions asking the candidate to explain or define, the detailed explanations and definitions have been indicated alongwith the value points.
4. For mere arithmetical errors, there should be minimal deduction. Only $\frac{1}{2}$ mark be deducted for such an error.
5. Wherever only two / three or a “given” number of examples / factors / points are expected only the first two / three or expected number should be read. The rest are irrelevant and must not be examined.
6. There should be no effort at “moderation” of the marks by the evaluating teachers. The actual total marks obtained by the candidate may be of no concern to the evaluators.
7. Higher order thinking ability questions are assessing student’s understanding / analytical ability.

General Note : In case of numerical question no mark is to be given if only the final answer is given.

5	The main causes for the number of firms being small in an oligopoly market is that there are barriers which prevent entry of new firms into industry. Patents, large capital requirement, control over the crucial raw material etc, prevent new firms from entering into industry. Only those who are able to cross these barriers can enter.	3																		
6	 <p>Maximum price ceiling refers to imposition of upper limit on the price of a good by the government. For example OP is price ceiling while OP_1 is equilibrium price. Producers are not allowed to sell good at a price greater than OP. The ceiling is normally imposed on goods needed by masses, like wheat, rice, sugar etc.</p> <p>For blind Candidates Only : Maximum price ceiling refers to imposition of upper limit on the price of a good by the government while minimum price ceiling refers to imposition of a lower limit on the price of a good by government.</p>	1 2 3																		
7	The measure of price elasticity of demand has a minus sign because there is inverse relation between price and demand, while the measure of price elasticity of supply has plus sign because there is direct relation between price and supply of a good.	3

23	<p>Money supply has two components: Currency and demand deposits with commercial banks. Currency is issued by the central bank while deposits are created by commercial banks by lending money to the people. In this way commercial banks also create money.</p> <p>Commercial banks lend money mainly to investors. The rise in investment in the economy leads to rise in national income through the multiplier effect.</p>	<p style="text-align: center;">2</p> <p style="text-align: center;">2</p>

26	<p>The Inflationary Gap is the amount by which aggregated demand exceeds aggregate supply at the full employment level. It is called inflationary because it leads to rise in the price level.</p> <p>Cash Reserve Ratio: is that percentage of bank deposits which are held as reserves with the central bank. Central Bank has the right to fix CRR. The central bank can reduce inflationary gap by raising CRR. Raising CRR will reduce lending capacity of the commercial banks. Less lending will lead to fall in aggregate demand helpful in</p>	<p style="text-align: center;">2</p> <p style="text-align: center;">4</p>

	<p style="text-align: center;">OR</p> <p>Deficient Demand: is the amount by which the aggregated demand falls short of aggregate supply at full employment level. It causes fall in price level.</p> <p>A Margin Requirements: is the difference between the amount of the loan and market value of security offered by the borrower against the loan. If the margin imposed is 40%, then the bank is allowed to give loan only upto 60% of the value of security. By reducing margin the lending capacity of the banks can be raised. More lending will leads to more aggregate demand, that is helpful in reducing deficient demand.</p>	<p style="text-align: center;">2</p> <p style="text-align: center;">4</p>
27	Government expenditure and taxes can help in fighting price fluctuations. Inflationary tendencies emerge due to aggregate demand being higher than aggregate supply. While reducing its own expenditure government, can bring down aggregate demand during inflation. During deflation government can increase its expenditure. To raise aggregate supply, tax concessions and subsidies can also be used.	6
