

## Question 1

Two cars A and B are travelling in the same direction with velocities  $v_A$  and  $v_B$  ( $v_A > v_B$ ). When the car is at a distance  $s$  behind car B, then the driver of the car A applies the brakes producing a uniform retardation  $a$ , there will be no collision when

Options:

A.  $s \leq \frac{v_A - v_B}{2}$

B.  $s \leq \frac{(v_A - v_B)^2}{2a}$

C.  $s \leq (v_A - v_B)^2$

D.  $s = \frac{(v_A - v_B)^2}{a}$

Answer: B

Solution:

**Solution:**

(b) For no collision, the speed of car A should be reduced to  $v_B$  before the cars meet, i.e. final relative velocity of car A with respect to car B is zero, i.e.

$$v_{\text{relative}} = 0$$

Here, initial relative velocity,  $u_r = v_A - v_B$

Relative acceleration,  $a_r = -a - 0 = -a$

Let relative displacement be  $s_r$ .

Thus, from third equation of motion, we get

$$v_{\text{relative}}^2 = u_r^2 + 2a_r s_r = (v_A - v_B)^2 - 2a s_r$$

$$\Rightarrow s_r = \frac{(v_A - v_B)^2}{2a}$$

For no collision,  $s \leq s_r$

$$\text{i.e., } s \leq \frac{(v_A - v_B)^2}{2a}$$

## Question 2

A point moves along X-axis initially at rest. Its acceleration is  $a = (6t + 5) \text{ m/s}^2$ . The distance covered in 2s, if it starts from origin is given by

**Options:**

- A. 6m
- B. 12m
- C. 16m
- D. 18m

**Answer: D****Solution:****Solution:**(d) Given , acceleration,  $a = (6t + 5)m / s^2$ 

$$a = \frac{dv}{dt} = 6t + 5$$

$$\Rightarrow dv = (6t + 5)dt$$

$$\Rightarrow \int dv = \int (6t + 5)dt$$

$$\Rightarrow v = 3t^2 + 5t + c$$

where, c is constant of integration.

When  $t = 0$ ,  $v = 0$ , so  $c = 0$ Therefore,  $v = 3t^2 + 5t$ 

$$\Rightarrow ds = (3t^2 + 5t)dt \quad \left[ \because v = \frac{ds}{dt} \right]$$

From 0 to 2s, we have

$$\int_0^s ds = \int_0^2 (3t^2 + 5t)dt$$

$$s = \left( t^3 + \frac{5}{2}t^2 \right)_0^2 = 8 + 10 = 18m$$

**Question 3**

**A ball released from the top of a tower falls  $\frac{11}{36}$  of the height of the tower in the last second of its fall. The height of the tower is**

**Options:**

- A. 180m
- B. 120m
- C. 140m
- D. 110m

**Answer: A****Solution:****Solution:**

(a) The distance travelled in nth second is given by

$$s = u + \frac{1}{2}a(2n - 1)$$

$$s = \frac{g}{2}(2n - 1) \quad [ \text{ here } , u = 0, a = g ]$$

©

According to the question,

$$\frac{11}{36}h = \frac{9.8}{2}(2n - 1) \dots\dots (i)$$

From second equation of motion,

$$h = \frac{1}{2}gn^2$$

[∵ u = 0]... (ii)

From Eqs. (i) and (ii), we have

$$\frac{11}{36} \times \frac{9.8}{2} \times n^2 = \frac{9.8}{2}(2n - 1) \text{ [here, } g = 9.8\text{m / s}^2 \text{ ]}$$

$$\Rightarrow 2n - 1 = \frac{11}{36}n^2$$

$$\Rightarrow 11n^2 - 72n + 36 = 0$$

$$\Rightarrow 11n^2 - 66n - 6n + 36 = 0$$

$$\Rightarrow 11n(n - 6) - 6(n - 6) = 0$$

$$\Rightarrow n = 6$$

(rejecting fractional values).

$$\text{Therefore, } h = \frac{1}{2} \times 10 \times 6 \times 6 = 180\text{m}$$

## Question 4

**A person throws a ball with speed 10m / s at an angle of 30° with horizontal from the top of 10m high tower. The distance of ball from the foot of the tower after falling on the ground will be**

**Options:**

A. 7m

B. 8.6m

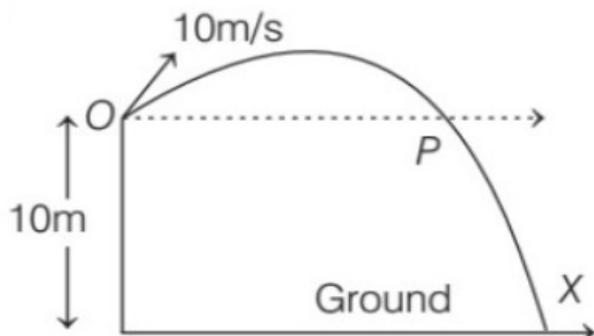

C. 9.6m

D. 10m

**Answer: B**

**Solution:**

**Solution:**

The ball will be at a point P when it is at a height of 10m from the ground. So, we have to find the distance OP, which can be calculated directly by considering it as a projectile on a levelled plane OX .

$$\text{Therefore, maximum range, } OP = R = \frac{u^2 \sin 2\theta}{g}$$

$$= \frac{10^2 \times \sin(2 \times 30^\circ)}{10} = \frac{10\sqrt{3}}{2} = 5\sqrt{3} = 8.6\text{m}$$

---

## Question 5

A 1kg mass is tied to a light inextensible string of length  $l = \frac{10}{3}m$ , is wheeled in circular path of radius 1ms in a vertical plane. The ratio of maximum to the minimum tension in the string is 4 . The speed of stone at the highest point of circle is

**Options:**

- A. 5m / s
- B. 10m / s
- C. 15m / s
- D. 20m / s

**Answer: B**

**Solution:**

**Solution:**

(b) The maximum tension in the string will be at lowest point i.e.,

$$T_{\max} = \frac{mv_1^2}{l} + mg$$

and minimum tension in the string will be the highest point

$$\text{i.e., } T_{\min} = \frac{mv_2^2}{l} - mg$$

$$\text{Therefore, } \frac{T_{\max}}{T_{\min}} = \frac{\frac{mv_1^2}{l} + mg}{\frac{mv_2^2}{l} - mg} = 4$$

$$\Rightarrow \frac{v_1^2 + gl}{v_2^2 - gl} = 4 \quad \dots\dots\dots (i)$$

$$\text{As we know, } v_1^2 = v_2^2 + 4gl \quad \dots\dots\dots (ii)$$

So from Eqs. (i) and (ii), we get

$$v_2^2 + 4gl + gl = 4v_2^2 - 4gl$$

$$\Rightarrow 3v_2^2 = 9gl$$

$$v_2^2 = 3gl = 3 \times 10 \times \frac{10}{3}$$

$$\Rightarrow v_2^2 = 100 \Rightarrow v_2 = 10m / s$$

---

## Question 6

The spheres of masses 2kg and 4kg are situated at the opposite end wooden bar of length 9m. Where does centre of mass of the system will

**Options:**

- A. 6m from 2kg sphere

- B. 2m from 4kg sphere
- C. 3m from 2kg sphere
- D. 6m from 4kg sphere

**Answer: A**

**Solution:**

**Solution:**

(a) Let 2kg mass be placed at  $x = 0$ , therefore 4kg mass will be situated at  $x = 9$ .  
Therefore,

$$x_{\text{COM}} = \frac{m_1x_1 + m_2x_2}{m_1 + m_2}$$

$$= \frac{0 + 4 \times 9}{2 + 4} = \frac{36}{6} = 6\text{m}$$

Thus, centre of mass will be situated at 6m from 2 kg mass.

## Question 7

**Assuming the expression for the pressure exerted by the gas, it can be shown that pressure is**

**Options:**

- A.  $\left(\frac{3}{2}\right)$ rd times kinetic energy per unit volume of gas
- B.  $\left(\frac{1}{3}\right)$ rd of kinetic energy per unit volume of a gas
- C.  $\left(\frac{3}{4}\right)$ th of kinetic energy per unit volume of a gas
- D.  $\left(\frac{2}{3}\right)$ rd of kinetic energy per unit volume of a gas

**Answer: D**

**Solution:**

**Solution:**

(d) The rms velocity of gas molecule,

$$v_{\text{rms}} = \sqrt{\frac{3RT}{m}}$$

$$\text{As, } K = \frac{1}{2}mv_{\text{rms}}^2$$

$$= \frac{1}{2}m \left( \frac{3RT}{m} \right) = \frac{3}{2}RT$$

$$\Rightarrow K = \frac{3}{2}RT \dots\dots (i)$$

From ideal gasequation for one mole,

$$pV = RT \dots\dots (ii)$$

From Eqs. (i) and (ii), we get,

$$p = \frac{2}{3} \frac{K}{V}$$

Hence, pressure is  $\left(\frac{2}{3}\right)$  rd of kinetic energy per unit volume of gas.

---

## Question 8

**Out of the following which statement is NOT true about black body radiation?**

**Options:**

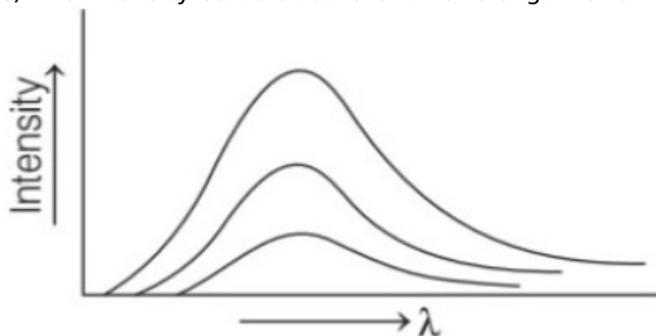

- A. A black body emits all wavelengths.
- B. Intensity is less for longer wavelengths.
- C. Intensity is same for all wavelengths.
- D. Intensity is more for shorter wavelengths.

**Answer: C**

**Solution:**

**Solution:**

(c) The intensity curve at different wavelength for different temperature is given below

A black body emits all wavelengths.

According to the graph, intensity is less for longer wavelength and more for shorter wavelength.

---

## Question 9

**An ideal gas ( $\gamma = 1.5$ ) is expanded adiabatically. How many times has the gas to be expanded to reduce root mean square velocity of molecules two times?**

**Options:**

- A. 8 times
- B. 20 times
- C. 16 times
- D. 12 times

©

**Answer: C**

**Solution:**

**Solution:**

(c) Given,  $\gamma = 1.5$   
rms velocity of gas molecule,

$$v_{\text{rms}} = \sqrt{\frac{3RT}{m}} \Rightarrow T \propto v^2$$

$$\Rightarrow \frac{T_2}{T_1} = \frac{v_2^2}{v_1^2}$$

Here,  $v_2 = \frac{v_1}{2}$

$$\therefore \frac{T_2}{T_1} = \frac{(v_1/2)^2}{v_1^2} = \frac{1}{4} \dots\dots\dots (i)$$

For adiabatic process,  
 $TV^{\gamma-1} = \text{constant}$

$$\Rightarrow \left(\frac{V_2}{V_1}\right)^{\gamma-1} = \left(\frac{T_1}{T_2}\right)$$

$$\Rightarrow \frac{V_2}{V_1} = \left(\frac{T_1}{T_2}\right)^{\frac{1}{\gamma-1}} = (4)^{\frac{1}{1.5-1}} \quad [\text{using Eq. (i)}]$$
$$= (4)^2 = 16$$

Hence, gas has to be expanded to 16 times.

---

## Question 10

**An ideal gas having pressure  $p$ , volume  $V$  and temperature  $T$  undergoes a thermodynamic process in which  $dW = 0$  and  $dQ < 0$ . Then, for the gas**

**Options:**

- A.  $p$  may increase or decrease
- B.  $T$  will decrease
- C.  $V$  will increase
- D.  $T$  will increase

**Answer: B**

**Solution:**

**Solution:**

(b) According to first law of thermodynamics,

$$\Delta U = \Delta Q - dW$$

It is given that,  $dW = 0$  and  $\Delta Q < 0$

Thus,  $\Delta U = C_V dT = \Delta Q$  is negative.

Since,  $C_V$  is specific heat, which remains constant, the temperature will decrease.

©

## Question 11

A particle executing SHM has velocities  $v_1$  and  $v_2$  at distances  $x_1$  and  $x_2$  respectively, from the mean position. Its time-period is

Options:

A.  $2\pi \sqrt{\frac{x_2^2 - x_1^2}{v_2^2 - v_1^2}}$

B.  $2\pi \sqrt{\frac{x_1^2 - x_2^2}{v_2^2 - v_1^2}}$

C.  $2\pi \sqrt{\frac{x_1 x_2}{v_2^2 - v_1^2}}$

D.  $2\pi \sqrt{\frac{x_1 + x_2}{v_1 v_2}}$

**Answer: B**

**Solution:**

**Solution:**

As, we know in SHM,

$$v^2 = \omega^2(a^2 - x^2)$$

$$\Rightarrow v_1^2 = \omega^2(a^2 - x_1^2) \dots\dots (i)$$

$$\text{and } v_2^2 = \omega^2(a^2 - x_2^2) \dots\dots\dots (ii)$$

Subtracting Eq. (i) from Eq. (ii), we get

$$v_2^2 - v_1^2 = \omega^2(x_1^2 - x_2^2)$$

$$= \frac{4\pi^2}{T^2}(x_1^2 - x_2^2) \left( \because \omega = \frac{2\pi}{T} \right)$$

$$\Rightarrow T = 2\pi \sqrt{\frac{x_1^2 - x_2^2}{v_2^2 - v_1^2}}$$

---

## Question 12

A spring of force constant 400N / m is loaded with a mass 0.25kg. The amplitude of oscillations is 4cm. When mass comes to equilibrium position. Its velocity is

Options:

A. 16m / s

B. 1.6m / s

C. 0.16m / s

D. 0.016m / s

**Answer: B**

**Solution:**

**Solution:**

(b) Given, mass,  $m = 0.25\text{kg}$

Force constant,  $k = 400\text{N / m}$

Amplitude of oscillations,  $A = 4\text{cm} = 0.04\text{m}$

$$\text{Angular frequency, } \omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{400}{0.25}}$$

$$= \sqrt{1600} = 40\text{rad / s}$$

Velocity at equilibrium position =  $\omega A$

$$= 40 \times 0.04 = 1.6\text{m / s}$$

---

## Question 13

**A progressive wave of frequency 500H z is travelling with a velocity of 360m / s. How far apart are two points 60° out of phase?**

**Options:**

A. 0.05m

B. 0.10m

C. 0.12m

D. 0.72m

**Answer: C**

**Solution:**

**Solution:**

(c) Given,

$$v = 360\text{ms}^{-1}$$

$$v = 500\text{H z}$$

$$\Delta\phi = 60^\circ = \frac{\pi}{3}$$

Since, velocity of a wave,  $v = v\lambda$

$$\Rightarrow \lambda = \frac{v}{v} = \frac{360}{500} = 0.72\text{m}$$

As, phase difference,  $\Delta\phi = \frac{2\pi}{\lambda} \times \text{path difference } (\Delta x)$

$$\Rightarrow \Delta x = \frac{\lambda}{2\pi} \times \Delta\phi$$

$$= \frac{0.72}{2\pi} \times \frac{\pi}{3} = 0.12\text{m}$$

---

## Question 14

A body sends waves 100mm long through medium P and 0.25m long in medium Q. If the velocity of wave in medium P is  $80\text{cms}^{-1}$ . The velocity of wave in medium Q is

**Options:**

- A.  $1\text{ms}^{-1}$
- B.  $2\text{ms}^{-1}$
- C.  $5\text{ms}^{-1}$
- D.  $7\text{ms}^{-1}$

**Answer: B**

**Solution:**

**Solution:**

(b) Given,  $\lambda_P = 100\text{mm} = 0.10\text{m}$

$\lambda_Q = 0.25\text{m}$

$v_P = 80\text{cms}^{-1} = 0.80\text{ms}^{-1}$

Since, frequency of wave remains same in the two media,

$$\frac{v_P}{\lambda_P} = \frac{v_Q}{\lambda_Q} \left( \because v = \frac{v}{\lambda} \right)$$

$$\Rightarrow v_Q = \frac{\lambda_Q}{\lambda_P} \times v_P = \frac{0.25}{0.10} \times 0.80 = 2\text{ms}^{-1}$$

## Question 15

Separation between the plates of parallel plate capacitor is  $d$  and the area of each plate is  $A$ . When a slab of material of dielectric constant  $k$  and thickness  $t$  ( $t < d$ ) is introduced between the plates, its capacitance becomes ( $\epsilon_0 =$  permittivity of free space)

**Options:**

- A.  $\frac{A\epsilon_0}{2d - t\left[1 - \frac{1}{k}\right]}$
- B.  $\frac{A\epsilon_0}{d + t\left[1 + \frac{1}{k}\right]}$
- C.  $\frac{A\epsilon_0}{d - t\left[1 - \frac{1}{k}\right]}$
- D.  $\frac{A\epsilon_0}{d - t\left[1 + \frac{1}{k}\right]}$

**Answer: C**

## Solution:

### Solution:

(c) The given situation can be shown as

The capacitance of a parallel plate capacitor is given by

$$C = \frac{k\epsilon_0 A}{d}$$

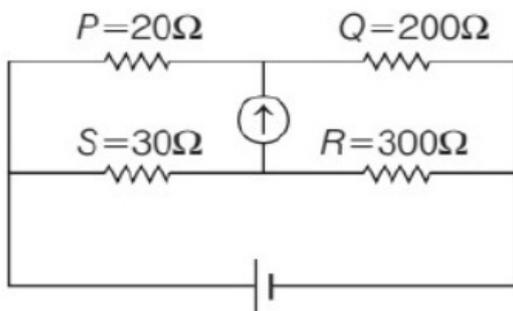

The above circuit can be considered to be combination of two series capacitors as

$$\begin{aligned}\therefore \frac{1}{C} &= \frac{1}{C_1} + \frac{1}{C_2} = \frac{(d-t)}{\epsilon_0 A} + \frac{t}{k\epsilon_0 A} \\ &= \frac{k(d-t) + t}{k\epsilon_0 A} = \frac{d-t + \frac{t}{k}}{\epsilon_0 A} = \frac{d-t\left(1 - \frac{1}{k}\right)}{\epsilon_0 A} \\ \Rightarrow C &= \frac{\epsilon_0 A}{d-t\left(1 - \frac{1}{k}\right)}\end{aligned}$$

---

## Question 16

Figure below shows a balanced Wheatstone's network. If it is disturbed by changing  $P$  to  $22 \Omega$ , then which of the following steps will bring the bridge again in balanced state?

### Options:

- A. By increasing  $S$  by  $3 \Omega$
- B. By increasing  $Q$  by  $20 \Omega$
- C. By increasing  $R$  by  $30 \Omega$
- D. Both (a) and (b)

**Answer: D**

**Solution:**

**Solution:**

(d) At balanced condition,

$$\frac{P}{Q} = \frac{S}{R} \Rightarrow \frac{22}{200} = \frac{30}{300}$$

So, it can be balanced again by increasing the resistance S by  $3\Omega$  or by increasing Q by  $20\Omega$ .

---

## Question 17

**Two circular coils A and B are made from the same wire but the radius of coil A is twice that of coil B. If the magnetic fields at their centres are the same, then the ratio of potential differences applied across A to that of B is**

**Options:**

A. 1 : 4

B. 4 : 1

C. 2 : 1

D. 1 : 2

**Answer: B**

**Solution:**

**Solution:**

(b) According to the question,

Magnetic field at centre of coil A = Magnetic field at centre of coil B

$$\frac{\mu_0 I_1}{2(2r)} = \frac{\mu_0 I_2}{2r}$$

$$\Rightarrow \frac{I_1}{I_2} = 2 \dots\dots (i)$$

We know,  $R = \rho \left( \frac{l}{A} \right)$ , where  $\rho$  is resistivity,  $l$  is length and  $A$  is area of cross-section.

$$\Rightarrow I_1 = \frac{V_1}{R_1} = \frac{V_1}{\rho \left( \frac{l_1}{A} \right)}$$

$$\Rightarrow \frac{V_1}{I_1} = \rho \cdot \frac{l_1}{A} \dots\dots (ii)$$

$$\text{and } I_2 = \frac{V_2}{R_2} = \frac{V_2}{\rho \cdot \left( \frac{l_2}{A} \right)}$$

$$\Rightarrow \frac{V_2}{I_2} = \rho \cdot \frac{l_2}{A} \dots\dots (iii)$$

From Eqs. (ii) and (iii), we get

$$\frac{V_1}{I_1} \times \frac{l_2}{V_2} = \frac{l_1}{I_2} = \frac{2\pi r_1}{2\pi r_2}$$

$$\Rightarrow \frac{V_1}{V_2} \cdot \frac{l_2}{l_1} = \frac{r_1}{r_2}$$

$$\Rightarrow \frac{V_1}{V_2} \cdot \frac{l_2}{l_1} = \frac{2r}{r}$$

$$\Rightarrow \frac{V_1}{V_2} = 2 \cdot \frac{2}{1} = 2 \times 2 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \frac{V_1}{V_2} = \frac{4}{1} = 4 : 1$$

---

## Question 18

A bar magnet of magnetic moment  $M_1$  is cut into two pieces along its axis. The pieces are kept perpendicular to each other with their unlike poles in contact. The magnetic moment of the arrangement is  $M_2$ . The ratio of  $M_1 / M_2$  is

Options:

A.  $1 / 2\sqrt{2}$

B. 1

C.  $\sqrt{2}$

D.  $1 / \sqrt{2}$

Answer: C

Solution:

Solution:

(c) In given case, the magnetic moment of the pieces get halved.

$$\text{i.e., } M_1' = M_2' = \frac{M_1}{2}$$

The magnetic moment of given arrangement,

$$M_2 = \sqrt{(M_1')^2 + (M_2')^2}$$
$$= \sqrt{\left(\frac{M_1}{2}\right)^2 + \left(\frac{M_1}{2}\right)^2} = \frac{M_1}{\sqrt{2}}$$

$$\Rightarrow \frac{M_1}{M_2} = \sqrt{2}$$

---

## Question 19

Frequency of the series limit of Balmer series of hydrogen atom of Rydberg's constant  $R$  and velocity of light  $c$  is

Options:

A.  $4Rc$

B.  $\frac{4}{Rc}$

C.  $Rc$

D.  $\frac{Rc}{4}$

**Answer: D**

**Solution:**

**Solution:**

(d) We know that, wavelength of spectrum in hydrogen atom is given as

$$\frac{1}{\lambda} = R \left( \frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

For the series limit of Balmer series,  $n_1 = 2$  and  $n_2 = \infty$

$$\therefore \frac{1}{\lambda} = R \left[ \frac{1}{2^2} - \frac{1}{\infty^2} \right]$$

$$\Rightarrow \frac{1}{\lambda} = \frac{R}{4} \Rightarrow \lambda = \frac{4}{R} \Rightarrow \frac{c}{f} = \frac{4}{R} [\because c = f\lambda]$$

$$\Rightarrow f = \frac{Rc}{4}$$

## Question 20

**A spherical solid ball of volume  $V$  is made up of a material of density  $\rho_1$ . It is falling through a liquid of density  $\rho_2$  ( $\rho_2 < \rho_1$ ). Assume that, the liquid applies a viscous force on the ball that is proportional to the square of the speed  $v_t$ , i.e.,  $F_{\text{viscous}} = K V_t^2$ , then the terminal speed of ball is**  
**(  $g$  = acceleration due to gravity)**

**Options:**

A.  $\sqrt{\frac{K(\rho_1 - \rho_2)}{Vg}}$

B.  $\sqrt{\frac{Vg(\rho_1 - \rho_2)}{K}}$

C.  $\sqrt{\frac{Vg(\rho_1 - \rho_2)}{K}}$

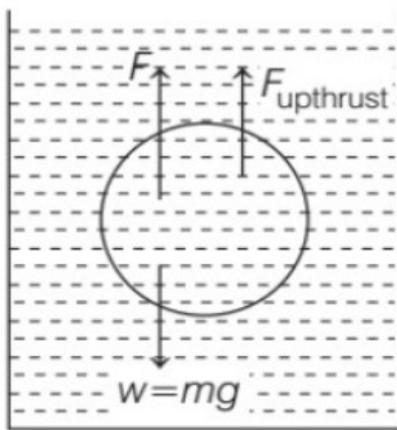

D.  $\sqrt{\frac{Vg(\rho_1 - \rho_2)}{2K}}$

**Answer: B**

**Solution:**

**Solution:**

(b) The given situation is shown below

When ball moves with terminal velocity ( $v_t$ ), then

$$F_{\text{viscous}} + F_{\text{upthrust}} = W$$

$$K v_t^2 + V \rho_2 g = mg$$

$$\Rightarrow K v_t^2 + V \rho_2 g = V \rho_1 g$$

$$\Rightarrow K v_t^2 = V (\rho_1 - \rho_2) g$$

$$v_t = \sqrt{\frac{V (\rho_1 - \rho_2) g}{K}}$$

## Question 21

**A charge of magnitude  $3e$  and mass  $2m$  is moving in an electric field  $E$ . The acceleration imparted to the charge is**

**Options:**

A.  $\frac{3E e}{2m}$

B.  $\frac{3m}{2E e}$

C.  $\frac{2E e}{3m}$

D.  $\frac{2m}{3E e}$

**Answer: A**

**Solution:**

**Solution:**

(a) Given, charge on particle,  $q = 3e$

Mass,  $m = 2m$

Force on charged particle in electric field,

$$F = qE = 3eE$$

$\therefore$  Acceleration imparted to charged particle,

$$a = \frac{F}{m} = \frac{3eE}{2m}$$

## Question 22

In a two input logic gate, when one input is 1 and the other is 0 the output is 1 . But even if both inputs are 0, the outputs is 1 . The logic gate is

Options:

- A. a X-OR gate
- B. an AND gate
- C. a NOR gate
- D. a NAND gate

Answer: D

Solution:

Solution:

(d) According to given situation, truth table can be given as

Input			Output
A	B	AB	$(Y) = \overline{(AB)}$
0	0	0	1
0	1	0	1
1	0	0	1
1	1	1	0

Hence the given logic gate is NAND gate

---

## Question 23

The angular separation of the central maximum in the Fraunhofer diffraction pattern is measured. The slit is illuminated by the light of wavelength  $6000\text{\AA}$ . If the slit is illuminated by light of another wavelength, the angular separation decrease by 30%. The wavelength of light used is

Options:

- A.  $6000\text{\AA}$
- B.  $3500\text{\AA}$
- C.  $4200\text{\AA}$

©

D. 4700Å

**Answer: C**

**Solution:**

**Solution:**

(c) Given, wavelength of used light,  $\lambda_1 = 6000\text{Å}$

Initial angular separation,  $\beta_1 = \beta$

Final angular separation,  $\beta_2 = \beta - 30\%$  of  $\beta$

$\beta_2 = \beta - 0.3\beta = 0.7\beta$

We know that,  $\beta \propto \lambda$

$$\text{I.I} \Rightarrow \frac{\beta_1}{\beta_2} = \frac{\lambda_1}{\lambda_2}$$

$$\Rightarrow \lambda_2 = \frac{\beta_2 \times \lambda_1}{\beta_1} = \frac{0.7\beta \times 6000}{\beta} = 4200\text{Å}$$

---

## Question 24

**A series L – C – R circuit is connected to a source of alternating emf of 50V and the potential difference across inductor and capacitor is 90V and 60V, respectively. The potential difference across the resistor is**

**Options:**

A. 70V

B. 60V

C. 40V

D. 80V

**Answer: C**

**Solution:**

**Solution:**

(c) Given,  $V = 50\text{V}$ ,  $V_L = 90\text{V}$ ,  $V_C = 60\text{V}$

In L – C – R circuit,

$$\therefore V = \sqrt{V_R^2 + (V_L - V_C)^2}$$

$$\Rightarrow V^2 = V_R^2 + (V_L - V_C)^2$$

$$50^2 = V_R^2 + (90 - 60)^2$$

$$\Rightarrow 2500 = V_R^2 + 900$$

$$\Rightarrow V_R^2 = 1600$$

$$\Rightarrow V_R = \sqrt{1600} = 40\text{V}$$

---

## Question 25

**A particle of mass 5kg moves in a circle of radius 20cm. Its linear speed**

at a time  $t$  is given by  $v = 4t$ ,  $t$  is in second and  $v$  is in  $\text{ms}^{-1}$ . Find the net force acting on the particle at  $t = 0.5\text{s}$ .

**Options:**

- A. 20N
- B.  $20\sqrt{23}\text{N}$
- C.  $20\sqrt{26}\text{N}$
- D. 10N

**Answer: C**

**Solution:**

**Solution:**

(c) Given,  $r = 20\text{cm} = 0.2\text{m}$ ,  $t = 0.5\text{s}$ ,  $v = 4t$  and  $m = 5\text{kg}$

$$\text{Radial acceleration, } a_r = \frac{v^2}{r} = \frac{(4t)^2}{0.2} = \frac{16t^2}{0.2} = 80t^2$$

$$= 80 \times (0.5)^2$$

$$\text{At, } = 20\text{ms}^{-2}$$

Tangential acceleration of particle,

$$a_t = \frac{dv}{dt} = \frac{d}{dt}(4t) = 4\text{ms}^{-2}$$

$\therefore$  Net acceleration,

$$a_n = \sqrt{a_r^2 + a_t^2} = \sqrt{(20)^2 + (4)^2} = 4\sqrt{26}\text{ms}^{-2}$$

$$\text{So, net force, } F_n = ma_n = 5 \times 4\sqrt{26}$$

$$= 20\sqrt{26}\text{N}$$

---

## Question 26

**A 1kg stone attached to the end of a 60cm chain is revolving at the rate of 3rev / s. If after 30s, it is making only 1rev / s. Find the mean torque acting on it.**

**Options:**

- A. 0.15N – m
- B. 0.32N – m
- C. 0.25N – m
- D. 0.20N – m

**Answer: A**

**Solution:**

**Solution:**

(a) Given,  $r = 60\text{cm} = 0.6\text{m}$   
 $m = 1\text{kg}$   
 $\omega_1 = 3\text{rev} / \text{s} = 2\pi \times 3\text{rad} / \text{s}$   
 $\omega_2 = 1\text{rev} / \text{s} = 2\pi \times 1\text{rad} / \text{s}$   
 $t = 30\text{s}$

$$\begin{aligned} \text{Torque, } \tau &= I \alpha = I \frac{d\omega}{dt} = mr^2 \frac{d\omega}{dt} \\ &= 1 \times (0.6)^2 \times \frac{2\pi(3) - 2\pi(1)}{30} \\ &= 0.15\text{N} - \text{m} \end{aligned}$$

## Question 27

A toroid is a long coil of wire wound over a circular core. Major radius and cross-sectional radius of toroid is  $R$  and  $r$ , respectively. The coefficient of mutual induction of the toroid is (The magnetic field in it is uniform,  $N$  = number of turns,  $R \gg r$ ,  $\mu_0$  = permeability of free space)

**Options:**

- A.  $\frac{\mu_0 N R}{2r}$
- B.  $\frac{\mu_0 N^2 R^2}{2r}$
- C.  $\frac{\mu_0 N r}{2R}$
- D.  $\frac{\mu_0 N^2 r^2}{2R}$

**Answer: B**

**Solution:**

**Solution:**

(b) The coefficient of mutual induction is given by

$$M = \frac{\mu_0 N_1 N_2 A}{l} \dots\dots (i)$$

where,  $\mu_0$  is the permeability of free space,  $N_1$  is the number of turns in primary coil,  $N_2$  is the number of turns in secondary coil,  $A$  is the common area of cross-section and  $l$  is the length of coils.

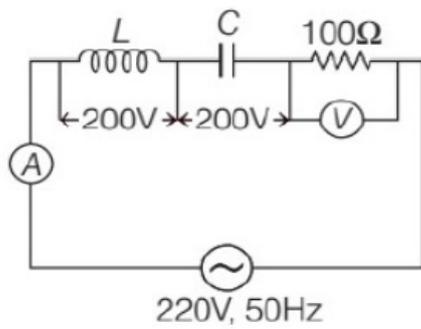

Thus, for toroid the Eq. (i) is given as

$$M = \frac{\mu_0 N \cdot N \cdot \pi R^2}{2\pi r} = \frac{\mu_0 N^2 R^2}{2r} \left[ \begin{array}{l} \because N_1 = N_2 = N \\ A = \pi R^2 \quad l = 2\pi r \end{array} \right]$$

where,  $R$  is the major radius and  $r$  is the minor radius.

## Question 28

The readings of ammeter and voltmeter in the given circuit are respectively

**Options:**

- A. 2.2A, 220V
- B. 2A, 200V
- C. 2.5A, 200V
- D. 2A, 220V

**Answer: A**

**Solution:**

**Solution:**

(a) Since, the voltage across inductor and capacitor is same, so they are in resonance i.e.,

$$X_L = X_C$$

The impedance of circuit,

$$Z = \sqrt{R^2 + (X_L - X_C)^2} = R$$

$\therefore$  Voltage across,  $R = 220V$

By Ohm's law,  $V = IR$

$$\Rightarrow I = \frac{V}{R} = \frac{220}{100} = 2.2A$$

Hence, ammeter reading is 2.2A and voltmeter reading is 220V .

## Question 29

Let  $E_e$  and  $E_p$  represent kinetic energy of electron and photon, respectively. If de-Broglie wavelength  $\lambda_p$  of a photon is twice the de-Broglie wavelength  $\lambda_e$  of an electron, then  $\frac{E_p}{E_e}$  is (speed of electron  $= \frac{c}{100}$ ,  $c =$  velocity of light)

**Options:**

- A.  $10^{-1}$
- B.  $10^2$
- C.  $10^{-2}$
- D.  $10^4$

# Exam Bro

**CLICK HERE!**

**Download Now**

**Answer: B**

**Solution:**

**Solution:**

$$(b) \text{ For electron, } \lambda_e = \frac{h}{\sqrt{2mE_e}} \Rightarrow E_e = \frac{h^2}{(2m)\lambda_e^2}$$

$$\text{For photon, } \lambda_p = \frac{hc}{E_p}$$

$$\Rightarrow E_p = \frac{hc}{\lambda_p} = \frac{hc}{2\lambda_e} \quad (\because \lambda_p = 2\lambda_e)$$

$$\Rightarrow \frac{E_p}{E_e} = \frac{hc}{2\lambda_e} \times \frac{2m\lambda_e^2}{h^2} = mc \times \frac{\lambda_e}{h}$$

$$\text{Also, } \lambda_e = \frac{h}{mv_e} \Rightarrow \frac{\lambda_e}{h} = \frac{1}{mv_e}$$

$$\Rightarrow \frac{E_p}{E_e} = mc \times \frac{1}{mv_e} = \frac{c}{v_e}$$

$$= \frac{c}{c/100} \quad \left( \because v_e = \frac{c}{100} \right)$$
$$= 100 = 10^2$$

## Question 30

**A nucleus of rest splits into two nuclear parts having radii in the ratio 1 : 2. Their velocities are in the ratio**

**Options:**

A. 1 : 8

B. 1 : 4

C. 4 : 1

D. 8 : 1

**Answer: D**

**Solution:**

**Solution:**

(d) If  $A_1$  and  $A_2$  are the mass number of two parts.

The radius of nucleus is given by

$$R = R_0(A)^{1/3}$$

$$\text{So, } R_1 = R_0(A_1)^{1/3} \text{ and } R_2 = R_0(A_2)^{1/3}$$

$$\Rightarrow \frac{R_1}{R_2} = \left( \frac{A_1}{A_2} \right)^{1/3}$$

$$\Rightarrow \frac{A_1}{A_2} = \left( \frac{R_1}{R_2} \right)^3 = \left( \frac{1}{2} \right)^3 = \frac{1}{8}$$

$$\therefore \text{Ratio of masses, } \frac{m_1}{m_2} = \frac{A_1}{A_2} = \frac{1}{8}$$

From conservation of momentum,

$$\Rightarrow m_1v_1 = m_2v_2$$

$$\Rightarrow \frac{v_1}{v_2} = \frac{m_2}{m_1} = \frac{8}{1} \text{ or } 8 : 1$$

---

## Question 31

**For a common-emitter amplifier, the voltage gain is 40 . Its input and output impedances are 100Ω and 400Ω, respectively. The power gain of the CE amplifier will be**

**Options:**

- A. 450
- B. 400
- C. 300
- D. 500

**Answer: B**

**Solution:**

**Solution:**

(b) Given, voltage gain = 40,  $R_{in} = 100\Omega$ ,  
 $R_{out} = 400\Omega$

Since, voltage gain =  $\beta \left( \frac{R_{out}}{R_{in}} \right)$

$$\Rightarrow \beta = \text{Voltage gain} \times \frac{R_{in}}{R_{out}}$$

$$= 40 \times \frac{100}{400} = 10$$

$$\text{Power gain} = \beta \times \text{voltage gain}$$
$$= 10 \times 40 = 400$$

---

## Question 32

**Two particles A and B having same mass have charge +q and +4q, respectively. When they are allowed to fall from rest through same electric potential difference the ratio of their speeds  $v_A$  to  $v_B$  will become**

**Options:**

- A. 2 : 1
- B. 1 : 4
- C. 4 : 1

D. 1 : 2

**Answer: D**

**Solution:**

**Solution:**

(d) Given, mass of both particle =  $m$

Charge of particle, A =  $+q$

Charge of particle, B =  $+4q$

Potential difference =  $V$

Kinetic energy is given by

$$K = \frac{1}{2}mv^2 \dots\dots (i)$$

This energy is equal to electrostatic potential energy is

$$K = V \times Q \dots\dots (ii)$$

From Eqs. (i) and (ii), we have

$$\frac{1}{2}mv^2 = V \times Q$$

For particle A,

$$qV = \frac{1}{2}mv_A^2 \dots\dots (iii)$$

For particle B,

$$4qV = \frac{1}{2}mv_B^2 \dots\dots (iv)$$

Dividing Eq. (iii) by Eq. (iv), we get

$$\frac{1}{4} = \frac{v_A^2}{v_B^2}$$

$$\Rightarrow \frac{v_A}{v_B} = \frac{1}{2}$$

Hence, the ratio of their speed  $\frac{v_A}{v_B} = \frac{1}{2}$

## Question 33

The potential at a point  $x$  (measured in  $\mu\text{m}$ ) due to some charges situated on the  $X$ -axis is given by  $v(x) = \frac{20}{(x^2 - 4)}\text{V}$

The electric field  $E$  at  $x = 4\mu\text{m}$  is given by

**Options:**

- A.  $\frac{5}{2}\text{V} / \mu\text{m}$  and in the - ve  $x$ -direction
- B.  $\frac{5}{2}\text{V} / \mu\text{m}$  and in the + ve  $x$ -direction
- C.  $\frac{10}{9}\text{V} / \mu\text{m}$  and in the - ve  $x$ -direction
- D.  $\frac{10}{9}\text{V} / \mu\text{m}$  and in the + ve  $x$ -direction

**Answer: D**

**Solution:**

©

**Solution:**

$$(d) \mathbf{E} = -\frac{\partial V}{\partial x} \hat{i} - \frac{\partial V}{\partial y} \hat{j} - \frac{\partial V}{\partial z} \hat{k}$$

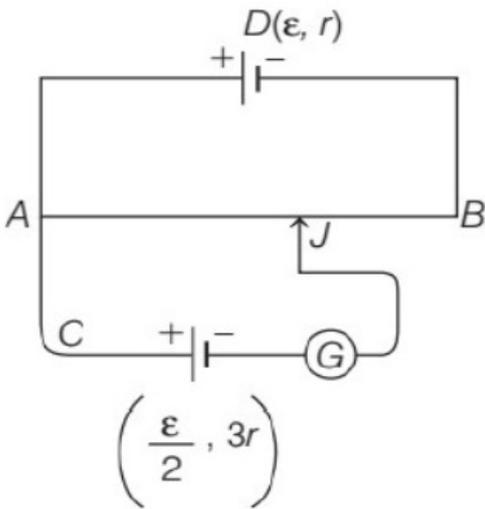

$$\Rightarrow E_x = -\frac{\partial V}{\partial x} = -\frac{d}{dx} \left[ \frac{20}{x^2 - 4} \right] = \frac{40x}{(x^2 - 4)^2}$$

$$\Rightarrow E_x \text{ at } x = 4 \mu\text{m} = \frac{10}{9} \text{V} / \mu\text{m}$$

and is along +ve x-direction.

## Question 34

A potentiometer wire AB having length L and resistance 12r is joined to a cell D of emf  $\varepsilon$  and internal resistance r. A cell C having emf  $\frac{\varepsilon}{2}$  and internal resistance 3r is connected. The length AJ at which galvanometer as shown in figure shows no deflection is

**Options:**

A.  $\frac{5}{12}L$

B.  $\frac{11}{12}L$

C.  $\frac{13}{24}L$

D.  $\frac{11}{24}L$

**Answer: C**

**Solution:**

**Solution:**

(c) Given, length of wire, AB = L

Resistance of wire, AB = 12r

emf of cell D =  $\varepsilon$ , internal resistance of D = r

emf of cell C =  $\frac{\varepsilon}{2}$ , internal resistance of C = 3r

$$\text{Current in potentiometer wire (i)} = \frac{\text{Total emf}}{\text{Total resistance}}$$

$$i = \frac{\varepsilon}{r + 12r} = \frac{\varepsilon}{13r}$$

Potential drop across the balance length AJ of potentiometer wire is  $V_{AJ} = i \times R_{AJ}$

$\Rightarrow V_{AJ} = i$  (resistance per unit length  $\times$  length AJ )

$$V_{AJ} = i \left( \frac{12r}{L} \times x \right)$$

where, x is the balance length AJ .

As null point occurs at J , so potential drop across balance length,

AJ = emf of cell C

$$V_{AJ} = \frac{\varepsilon}{2} \Rightarrow i \left( \frac{12r}{L} \times x \right) = \frac{\varepsilon}{2}$$

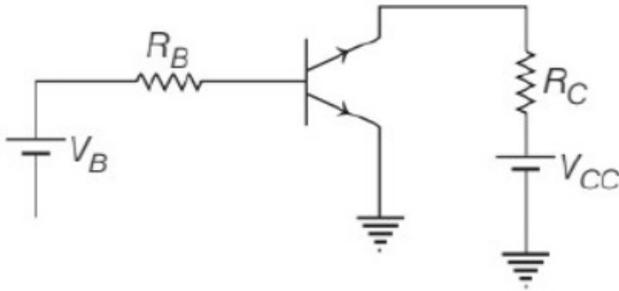

$$\Rightarrow \frac{\varepsilon}{13r} \times \frac{12r}{L} \times x = \frac{\varepsilon}{2}$$

$$\Rightarrow x = \frac{13L}{24}$$

## Question 35

**A common emitter amplifier circuit built using an n – p – n transistor is shown in figure. Its DC current gain is 300,  $R_C = 4k\Omega$  and  $V_{CC} = 20V$  .**

**What is the minimum base current for  $V_{CE}$  to reach saturation?**

**Options:**

- A.  $40\mu A$
- B.  $26.66\mu A$
- C.  $16.66\mu A$
- D.  $10\mu A$

**Answer: C**

**Solution:**

**Solution:**

(c) For CE n – p – n transistor, DC current gain,

$$\beta_{DC} = \frac{I_C}{I_B}$$

At saturation state,  $V_{CE}$  becomes zero,

$$\therefore V_{CC} - I_C R_C = 0$$

$$I_C \approx \frac{V_{CC}}{R_C} = \frac{20}{4000} = \frac{1}{200} A$$

Hence, saturation base current,

$$I_B = \frac{I_C}{\beta_{DC}} = \frac{1}{200 \times 300} = \frac{1}{60000} A = 16.66\mu A$$

## Question 36

A satellite is revolving round a planet in a circular orbit close to its surface and  $\rho$  is mean density and  $R$  is the radius of planet, then the period of ( $G =$  universal constant of gravitation)

Options:

A.  $\sqrt{\frac{3\pi}{\rho G}}$

B.  $\sqrt{\frac{\pi}{\rho G}}$

C.  $\sqrt{\frac{2\pi}{\rho G}}$

D.  $\sqrt{\frac{4\pi}{\rho G}}$

Answer: A

Solution:

Solution:

(a) According to deduction of Kepler's third law and with the help of Newton's law, the law of period is given by

$$\text{or } T^2 = \frac{4\pi^2}{GM} r^3$$

$$\Rightarrow T = 2\pi \sqrt{\frac{r^3}{GM}}$$

where,  $r$  is the radius of orbit and  $M$  is mass of the planet or star.

As satellite is very close of the planet, thus  $r = R$

Also mass ( $M$ ) = density ( $\rho$ )  $\times$  volume ( $V$ )

$$= \rho \times \frac{4}{3}\pi R^3$$

$$\therefore T = 2\pi \sqrt{\frac{R^3}{G \times \frac{4}{3}\pi R^3}} = \sqrt{\frac{3\pi}{\rho G}}$$

## Question 37

Halley's Comet revolves around the sun with time period of 76 years. The aphelion distance if perihelion is given by  $8.9 \times 10^{10}$  m, will be (Take, mass of sun =  $2 \times 10^{30}$  kg and  $G = 6.67 \times 10^{-11}$  N m<sup>3</sup> / kg<sup>2</sup>)

Options:

A.  $4.7 \times 10^{11}$  m

B.  $3.23 \times 10^{12}$  m

C.  $5.3 \times 10^{12}\text{m}$

D.  $7.63 \times 10^{11}\text{m}$

**Answer: C**

**Solution:**

**Solution:**

(c) According to Kepler's third law, time period

$$T^2 = \frac{4\pi^2}{GM}a^3$$

where, a is the semi-major axis,

$$\Rightarrow a = \left[ \frac{76 \times 86400 \times 365 \times 6.67 \times 2 \times 10^{30}}{4 \times 3.14 \times 3.14} \right]^{1/3}$$

$$= 2.7 \times 10^{12}\text{m}$$

Also in case of ellipse,

$$2a = \text{perihelion} + \text{aphelion}$$

$$\Rightarrow \text{Aphelion} = 2a - \text{perihelion}$$

$$= 2 \times 2.7 \times 10^{12} - 8.9 \times 10^{10}$$

$$\approx 5.3 \times 10^{12}\text{m}$$

---

## Question 38

**540g of ice at  $0^\circ\text{C}$  is mixed with 540g of water at  $80^\circ\text{C}$ . The final temperature of the mixture will be**

**Options:**

A.  $53.3^\circ\text{C}$

B.  $56.6^\circ\text{C}$

C.  $60.6^\circ\text{C}$

D.  $62.3^\circ\text{C}$

**Answer: A**

**Solution:**

**Solution:**

(a) From the principle of calorimetry,

$$m_1s_1 \Delta T_1 = m_2s_2 \Delta T_2$$

$$540 \times S_w(80 - T) = 540 \times \frac{S_w}{2} \times (T - 0) \text{ where, } s_w \text{ is specific heat of water.}$$

$$\Rightarrow T = \frac{160}{3}^\circ\text{C} = 53.3^\circ\text{C}$$

---

## Question 39

**The temperature of a liquid drops from 365K to 361K in 2min. Find the**

**time during which temperature of the liquid drops from 344K to 342K.  
(Take, room temperature = 293K )**

**Options:**

- A. 72s
- B. 66s
- C. 60s
- D. 84s

**Answer: D**

**Solution:**

**Solution:**

(d) According to Newton's law of cooling,

$$\frac{T_1 - T_2}{2} = K \left( \frac{T_1 + T_2}{2} - T_0 \right)$$

$$\frac{365 - 361}{2} = K \left[ \frac{365 + 361}{2} - 293 \right]$$

$$K = \frac{1}{35}$$

$$\Rightarrow t = \frac{14}{10} \text{min} = 84\text{s}$$

---

## Question 40

**The speed of sound in a mixture of 1 mole of He and 2 mole of oxygen at 27°C is**

**Options:**

- A. 400m / s
- B. 401m / s
- C. 402m / s
- D. 403m / s

**Answer: B**

**Solution:**

**Solution:**

(b) Molecular weight of the mixture,

$$M_{\text{mix}} = \frac{n_1 M_1 + n_2 M_2}{n_1 + n_2}$$

$$= \frac{1 \times 4 + 2 \times 32}{1 + 2} = \frac{68}{3} \times 10^{-3} \text{kgmol}^{-1}$$

For helium,  $C_{V_1} = \frac{3}{2}R$

For oxygen,  $C_{V_2} = \frac{5}{2}R$

$$(C_V)_{\text{mix}} = \frac{n_1 C_{V_1} + n_2 C_{V_2}}{n_1 + n_2}$$
$$= \frac{1 + \frac{3R}{2} + 2 \times \frac{5R}{2}}{1 + 2} = \frac{13R}{6}$$

Now,  $(C_p)_{\text{mix}} = (C_V)_{\text{mix}} + R$

$$= \frac{13R}{6} + R = \frac{19R}{6}$$

$$r_{\text{mix}} = \frac{(C_p)_{\text{mix}}}{(C_V)_{\text{mix}}} = \frac{19}{13}$$

Speed of sound in the mixture,  $v = \sqrt{\frac{r_{\text{mix}} \times RT}{M_{\text{mix}}}}$

$$= \sqrt{\frac{19}{13} \times \frac{8.31 \times 300}{\frac{68}{3} \times 10^{-3}}}$$

$$\approx 401 \text{ms}^{-1}$$

---

## Question 41

**The lower half of a concave mirror is covered with opaque material. Then,**

**Options:**

- A. the magnification will be halved
- B. the intensity of the image will be reduced
- C. the distance of the image will increase
- D. All of the above

**Answer: B**

**Solution:**

**Solution:**

(b) The law of reflection is true for all points of the remaining part of the mirror, so the image will be that of the whole object. However, as the area of the reflecting surface has been reduced, hence the intensity of the image will be low.

---

## Question 42

**An LED is placed at a depth  $h$  below the water surface. An opaque disc is floating on the surface of water such that the bulb is not visible from the surface. The minimum radius of the disc will be**

**Options:**

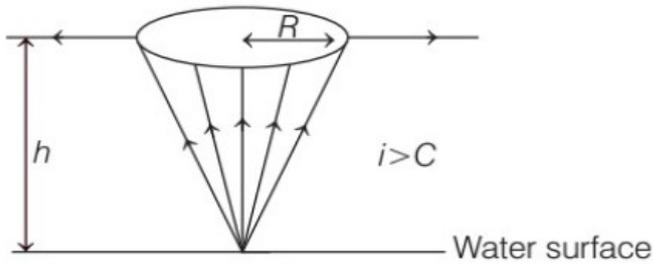

- A.  $\frac{2h}{\mu}$
- B.  $\frac{h}{\sqrt{\mu - 1}}$
- C.  $\frac{h}{2\mu - 1}$
- D.  $\frac{\mu}{2h}$

**Answer: B**

**Solution:**

**Solution:**

(b) The given situation is shown below

From the figure we can see the light from the LED will not emerge out of the water, if at the edge of the disc, the incidence angle is greater than critical angle.

i.e.,  $i > C$   
or  $\sin i > \sin C$

Now, if  $R$  is the radius of disc and  $h$  is the depth of the LED, then

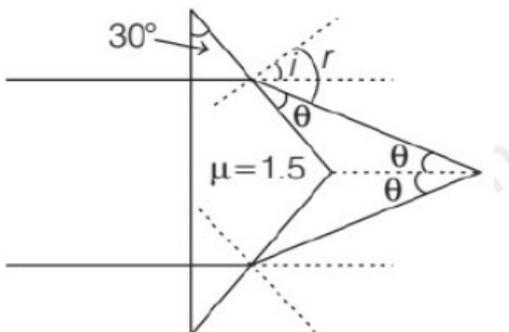

$$\sin i = \frac{R}{\sqrt{R^2 + h^2}} \text{ and } \sin C = \frac{1}{\mu}$$

From Eq (i), we have

$$\frac{R}{\sqrt{R^2 + h^2}} > \frac{1}{\mu} \Rightarrow R > \frac{h}{\sqrt{\mu - 1}}$$

## Question 43

**For the prism given below. Two light rays are incident normally on the surface of the prism. The angle between emergent rays will be**

**Options:**

- A.  $27^\circ$
- B.  $32^\circ$

C.  $37^\circ$

D.  $42^\circ$

**Answer: C**

**Solution:**

**Solution:**

(c) The angle between any two lines is equal to the angle between their perpendiculars.

$\therefore i = 30^\circ$

From Snell's law, we have

$$\frac{1}{1.5} = \frac{\sin 30^\circ}{\sin r}$$

$$\Rightarrow \sin r = 0.75 \text{ or } r = 48.6^\circ$$

Therefore,  $\theta = r - i$

$$= 48.6^\circ - 30^\circ = 18.6^\circ$$

$\therefore$  Required angle between two emergent rays

$$= 2 \times 18.6^\circ$$

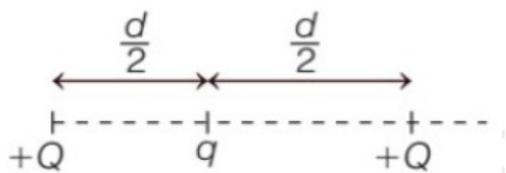

$$= 37.2^\circ \approx 37^\circ$$

---

## Question 44

Three charges are arranged as the configuration given below.

If net force experienced by  $+Q$  placed at  $x = 0$  is zero, then the value of  $q$  is

**Options:**

A.  $\frac{-Q}{4}$

B.  $\frac{Q}{2}$

C.  $\frac{-Q}{2}$

D.  $\frac{Q}{4}$

**Answer: A**

**Solution:**

**Solution:**

(a) From the principle of superposition, we have

$$F_{\text{net}} = \frac{1}{4\pi\epsilon_0} \frac{Q \times q}{\left(\frac{d}{2}\right)^2} + \frac{1}{4\pi\epsilon_0} \frac{Q \times Q}{(d)^2}$$

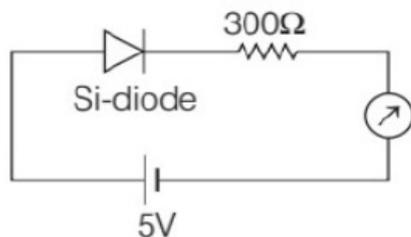

Since,  $F_{\text{net}} = 0$

$$\Rightarrow \frac{1}{4\pi\epsilon_0} \frac{Q \times q}{\left(\frac{d}{2}\right)^2} = -\frac{1}{4\pi\epsilon_0} \frac{Q \times Q}{d^2} \Rightarrow q = -\frac{Q}{4}$$

---

## Question 45

What will be the reading in the ammeter for the circuit given below

**Options:**

- A. 12.3mA
- B. 12.3mA
- C. 11.3mA
- D. 14.3mA

**Answer: D**

**Solution:**

**Solution:**

(d) Potential drop across silicon diode in forward bias is around 0.7V .

In the given circuit, potential drop across 300Ω resistor is

$$\Delta V = IR$$

$$\Rightarrow I = \frac{\Delta V}{R} = \frac{5 - 0.7}{300} = 0.01433A$$

$$\text{or } I = 14.33mA$$

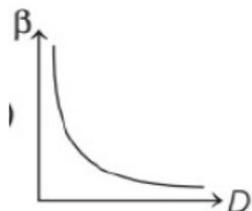

---

## Question 46

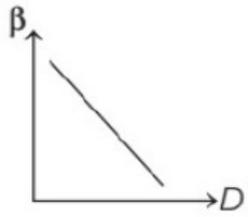

In Young's double slit experiment, which of the following graph represents correct variation of fringe width  $\beta$  versus distance  $D$  between sources and screen?

**Options:**

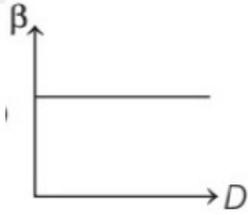

A.

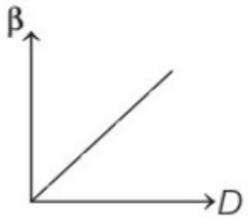

B.

C.

D.

**Answer: D**

**Solution:**

**Solution:**

(d) We know that, fringe width,

$$\beta = \frac{D\lambda}{d}$$

$$\Rightarrow \beta \propto D$$

Hence, graph (d) is the correct.

---

## Question 47

**An electron in hydrogen atom have energy of  $-3.4\text{eV}$  . The difference of its kinetic and potential energy is**

**Options:**

A.  $10.2\text{eV}$

B.  $-10.2\text{eV}$

C.  $-13.6\text{eV}$

D. Both (a) and (b)

**Answer: D**

## Solution:

### Solution:

(d) According to Bohr's model, the kinetic energy of moving electron in  $n$ th orbit is given as

$$K = \frac{Rhc}{n^2} \dots\dots (i)$$

where,  $R$  = Rydberg constant,  $h$  = Planck's constant and  $c$  = speed of light.

Similarly, potential energy of electron moving in  $n$ th orbit,

$$P = -2 \frac{Rhc}{n^2} \dots\dots (ii)$$

From Eqs. (i) and (ii), we have

$$P = -2K$$

Total energy of electron moving in  $n$ th orbit,

$$E = K + P = K - 2K$$

$$E = -K$$

$$\Rightarrow K = -E = -(-3.4\text{eV}) \text{ (given } E = -3.4\text{eV)}$$

$$K = 3.4 \text{ eV}$$

From Eq. (iii), we have

$$P = -2K = -2(3.4) = -6.8\text{eV}$$

$$\therefore P - K = -6.8 - 3.4 = -10.2\text{eV}$$

$$\text{and } K - P = 3.4 - (-6.8) = 10.2\text{eV}$$

---

## Question 48

**In most liquids, with rise in temperature, surface tension of a liquid**

### Options:

- A. remains unchanged
- B. decreases
- C. increases
- D. first decreases and then increases

**Answer: B**

### Solution:

### Solution:

(b) In most of liquids, the cause of dynamic viscosity is the intermolecular force of attraction or cohesive forces and on increasing the temperature, molecules of liquids try to move away from each other which in turn reduces the cohesive force and hence dynamic viscosity decreases with increase in temperature in case of liquid.

---

## Question 49

**Three identical thin rods each of length  $l$  and mass  $M$  are joined together to form a letter H. What is the moment of inertia of the system about one of the sides of H ?**

### Options:

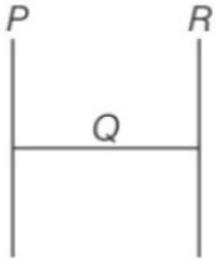

- A.  $\frac{MI^2}{4}$
- B.  $\frac{2MI^2}{3}$
- C.  $\frac{4MI^2}{3}$
- D.  $\frac{MI^2}{3}$

**Answer: C**

**Solution:**

**Solution:**

(c) The given situation can be shown as

So, moment of inertia of the system about P,

$$I = I_P + I_Q + IR$$

$$= 0 + \left( \frac{MI^2}{12} + \frac{MI^2}{4} \right) + MI^2 = \frac{4}{3}MI^2$$

## Question 50

**One thousand small water drops of equal radii combine to form a big drop. The ratio of final surface energy to the total initial surface energy is**

**Options:**

- A. 1000: 1
- B. 1 : 10
- C. 10 : 1
- D. 1 : 1000

**Answer: B**

**Solution:**

**Solution:**

(b) Let initial radius be  $r_1$ .

$$\text{Surface area of 1000 small water drops} = 1000 \times 4\pi r_1^2$$

**FREE!**

**JEE & NEET**

**MHT-CET**

# Exam Bro

CLICK HERE!

Download Now

$$\text{Volume of 1000 small drops} = 1000 \times \frac{4}{3}\pi r_1^3$$

Let final radius be  $r_2$ .

Since, initial volume = final volume

$$1000 \times \frac{4}{3}\pi r_1^3 = \frac{4}{3}\pi r_2^3$$

$$\Rightarrow 1000r_1^3 = r_2^3 \Rightarrow \frac{r_2}{r_1} = 10$$

Let us assume surface tension remain constant, i.e. S.

Therefore,  $\frac{(\text{Surface energy})_{\text{final}}}{(\text{Surface energy})_{\text{initial}}}$

$$= \frac{S \times 4\pi r_2^2}{S \times 4\pi r_1^2 \times 1000}$$

$$= \left(\frac{r_2}{r_1}\right)^2 \times \frac{1}{1000} = \frac{1}{10}$$

## Question 51

**Water rises to height 3.2cm in glass capillary tube. Find the height to which same water rises in another capillary having half the area of cross-section.**

**Options:**

- A. 4.5cm
- B. 5.0cm
- C. 5.4cm
- D. 6.2cm

**Answer: A**

**Solution:**

**Solution:**

(a) Given,  $h_1 = 3.2\text{cm}$

As per question,

$\frac{1}{2}$  (area of first capillary) = Area of second capillary

$$\Rightarrow \frac{1}{2} \times \pi r_1^2 = \pi r_2^2 \Rightarrow r_1 = \sqrt{2}r_2$$

For same fluid,

$$h_1 r_1 = h_2 r_2$$

$$\Rightarrow h_2 = \frac{h_1 r_1}{r_2} = \frac{3.2 \times \sqrt{2}r_2}{r_2} = 4.5\text{cm}$$

## Question 52

**If the pressure of an ideal gas is decreased by 10% isothermally, then its volume will**

**Options:**

- A. decrease by 8%
- B. increase by 8%
- C. decrease by 9%
- D. increase by 11.1%

**Answer: D****Solution:****Solution:**

(d) From ideal gas equation,  $pV = nRT$   
 For isothermal process, temperature remains constant,  
 So, for one mole of gas,  
 $pV = \text{constant}$   
 So, if pressure decreases, then volume increases.  
 $\Rightarrow p_1 V_1 = p_2 V_2$

$$\text{Here, } p_2 = p_1 \left( 1 - \frac{1}{10} \right) = \frac{9}{10} p_1$$

$$\Rightarrow V_2 = \frac{10}{9} V_1$$

$\therefore$  Percentage increase in volume

$$= \left( \frac{V_2 - V_1}{V_1} \right) \times 100$$

$$= \left( \frac{10}{9} - 1 \right) \times 100$$

$$= \frac{1}{9} \times 100 = 11.1\%$$

**Question 53**

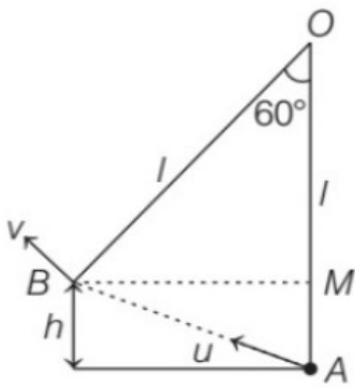

The pendulum bob has a speed of  $3\text{ms}^{-1}$  at its lowest position and the length of pendulum is 0.5m. The speed of the bob when the length of the pendulum makes an angle of  $60^\circ$  with the vertical will be

**Options:**

- A.  $1.5\text{ms}^{-1}$
- B.  $2\text{ms}^{-2}$
- C.  $2.7\text{ms}^{-1}$
- D.  $3.2\text{ms}^{-2}$

**Answer: B****Solution:****Solution:**

(b) Given,  $l = 0.5\text{m}$ ,  $u = 3\text{ms}^{-1}$   
 The situation is a shown below

Applying energy conservation at points A and B

$$\frac{1}{2}mu^2 = \frac{1}{2}mv^2 + mgh$$

$$\Rightarrow u^2 = v^2 + 2gh$$

$$v^2 = u^2 - 2gh = u^2 - 2g(I - I \cos 60^\circ)$$

$$[\text{since, } h = MA = OA - OM = I - OB \cos 60^\circ \\ = I - I \cos 60^\circ]$$

$$= (3)^2 - 2(9.8) \left( 0.5 - 0.5 \times \frac{1}{2} \right)$$

$$\Rightarrow v^2 \approx 4$$

$$\therefore v = 2\text{ms}^{-1}$$

## Question 54

**In Young's double slit experiment using monochromatic light of wavelength  $\lambda$ , the maximum intensity of light at a point on the screen is  $K$  units. The intensity of light at point where the path difference is  $\frac{\lambda}{3}$  is**

$$\left[ \cos 60^\circ = \sin 30^\circ \frac{1}{2} \right]$$

**Options:**

- A.  $\frac{K}{4}$
- B.  $\frac{K}{2}$
- C.  $K$
- D.  $\frac{3K}{4}$

**Answer: A**

**Solution:**

**Solution:**

(a) For monochromatic light the resultant intensity is

$$I_R = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos \theta$$

$$= 2I + 2I \cos \theta$$

$$(\because I_1 = I_2 = I) \dots (i)$$

For maximum intensity,  $\theta = 0^\circ$

$$I_R = 2I + 2I \cos 0^\circ = 4I \quad (\because \cos 0^\circ = 1)$$

$$\text{or } K = 4I$$

or  $I = \frac{K}{4}$

For path difference  $\lambda / 3$ , phase difference,

$$\phi = 2\pi \times \frac{\text{Path difference}}{\lambda} = 2\pi \times \frac{\lambda / 3}{\lambda} = \frac{2\pi}{3}$$

$$\therefore I_R = 2I + 2I \cos \frac{2\pi}{3}$$

[From Eq. (i)]

$$= 2I + 2I \left(-\frac{1}{2}\right) = 2I - I = I$$

$$= \frac{K}{4}$$

[using Eq. (ii)]

## Question 55

**In Young's double slit experiment, minimum intensity is obtained when phase difference of the superimposing waves is ( $n = 1, 2, 3\dots$ )**

**Options:**

- A.  $(2n - 1)\pi$
- B.  $(n + 1)\pi$
- C. zero
- D.  $n\pi$

**Answer: A**

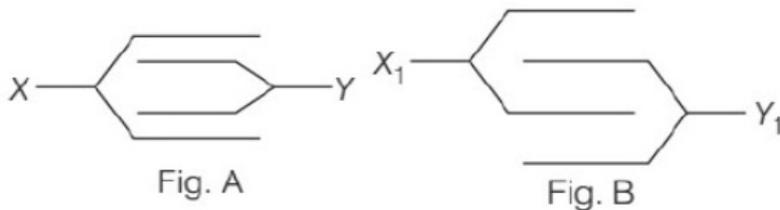

**Solution:**

**Solution:**

(a) For minima in YDSE, the phase difference as superimposing waves should be odd integral multiple of  $\pi$ .  
i.e.,  $\phi = (2n - 1)\pi$  (where,  $n = 1, 2, 3, \dots$ )

## Question 56

**Four plates of equal area  $A$  are separated by equal distance  $d$  and are arranged as shown in figure A. Their equivalent capacity is  $C_1$ . Then, the same four plates are arranged as shown in figure B, their equivalent capacity is  $C_2$ , then  $C_1 : C_2$  is**

**Options:**

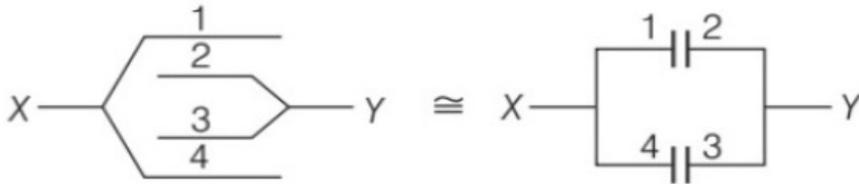

- A. 3 : 4
- B. 2 : 3
- C. 3 : 2
- D. 4 : 3

**Answer: B**

**Solution:**

**Solution:**

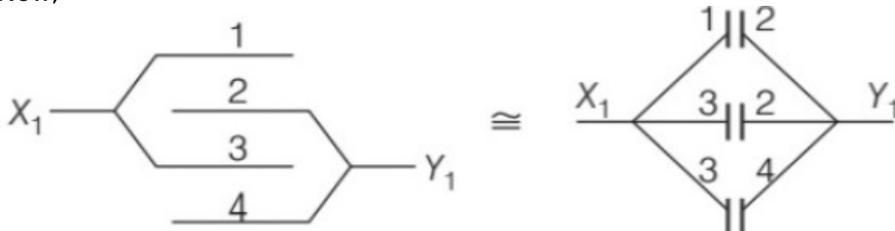

(b) Let X (1, 4) be positive plate and Y (2, 3) be negative plates.

The equivalent capacitance is just a parallel combination of two capacitors, therefore,

$$C_1 = \frac{\epsilon_0 A}{d} + \frac{\epsilon_0 A}{d} = \frac{2\epsilon_0 A}{d}$$

Now,

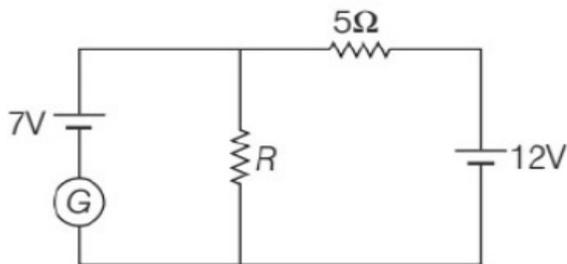

the equivalent capacitance is just a parallel combination of three capacitors. Therefore,

$$C_2 = \frac{\epsilon_0 A}{d} + \frac{\epsilon_0 A}{d} + \frac{\epsilon_0 A}{d} = \frac{3\epsilon_0 A}{d}$$

Therefore,  $\frac{C_1}{C_2} = \frac{2}{3}$

## Question 57

**For what value of R in the circuit shown below will the current in galvanometer be zero?**

**Options:**

- A. 2Ω
- B. 4Ω
- C. 5Ω

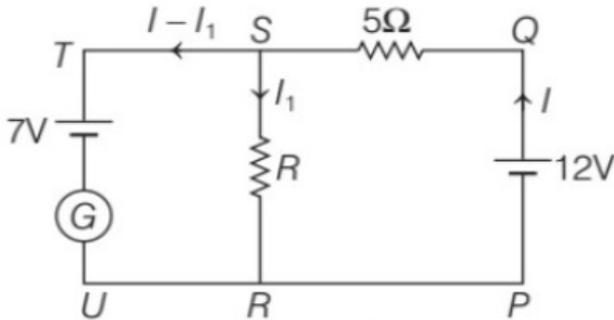

D.  $7\Omega$

**Answer: D**

**Solution:**

**Solution:**

(d) The current distribution in the circuit is shown below

Applying KVL in loop PQSRP, we get  
 $-5I - RI_1 + 12 = 0$  ..... (i)

Similarly, for loop SRUTS, we get  
 $r - I_1R + 7 = 0$

$$\Rightarrow I_1R = 7 \text{ ..... (ii)}$$

As per question,  $I - I_1 = 0 \Rightarrow I = I_1$  ..... (iii)

Solving Eqs. (i), (ii) and (iii), we get

$$-5I - 7 + 12 = 0 \Rightarrow I = 1\text{A}$$

From Eq. (ii),

$$R = 7\Omega$$

---

## Question 58

**A long wire carrying a steady current is bent into a circle of single turn. The magnetic field at the centre of the coil is B. If it is bent into a circular loop of radius  $r'$  having  $n$  turns, the magnetic field at the centre of the coil for same current is**

**Options:**

- A.  $nB$
- B.  $n^2B$
- C.  $\frac{B}{n}$
- D.  $\frac{B}{n^2}$

**Answer: B**

**Solution:**

**Solution:**

(b) The magnetic field at the centre of coils is

©

$$B = \frac{\mu_0 I}{2r} \dots\dots\dots (i)$$

where,  $r$  = radius of the coil.  
Let  $L$  be the length of wire, then

$$L = 2\pi r \Rightarrow 2r = \frac{L}{\pi}$$

From Eq. (i), we get

$$B = \frac{\mu_0 I \pi}{L} \dots\dots\dots (ii)$$

For a loop of  $n$  turns,  $L = 2\pi nr$

$$\Rightarrow 2r = \frac{L}{n\pi}$$

And current,  $I' = nI$

$$\therefore B' = \frac{\mu_0 I'}{2r} = \frac{\mu_0 nI}{L/n\pi} = \frac{\mu_0 n^2 I}{L} = n^2 B \text{ [from Eq. (ii)]}$$

## Question 59

**The mutual inductance between a primary and secondary circuit is 0.5H . The resistances of the primary and the secondary circuits are 20Ω and 5Ω, respectively. To generate a current of 0.4A in the secondary, current in the primary must be changed at the rate of**

**Options:**

- A. 16A / s
- B. 1.9A / s
- C. 4A / s
- D. 8A / s

**Answer: C**

**Solution:**

**Solution:**

(c) Given, coefficient of mutual inductance,  $m = 0.5H$

Resistance of primary,  $R_1 = 20\Omega$

Resistance of secondary,  $R_2 = 5\Omega$

Let, current in primary be  $I_1$ , such that current in secondary is  $I_2 = 0.4A$ .

Now, the emf induced in secondary due to change primary current is given by

$$\Rightarrow \varepsilon = M \frac{dI_1}{dt}$$

$$\Rightarrow (0.4) \times 5 = (0.5) \frac{dI_1}{dt} \quad (\because \varepsilon = I_2 R_2)$$

$$\Rightarrow \frac{dI_1}{dt} = 4A / s$$

## Question 60

**A condenser of capacitance 2.4μF is used in a transmitter to transmit at**

wavelength  $\lambda$ . If the inductor of  $10^{-8}\text{H}$  is used for resonant circuit, then the value of  $\lambda$  is

**Options:**

- A. 200m
- B. 254m
- C. 292m
- D. 320m

**Answer: C**

**Solution:**

**Solution:**

(c) Given,  $C = 2.4\mu\text{F} = 2.4 \times 10^{-6}\text{F}$   
 $L = 10^{-8}\text{H}$

At resonant frequency,  $v = \frac{1}{2\pi\sqrt{LC}}$

$$\Rightarrow LC = \frac{1}{4\pi^2 v^2} = \frac{\lambda^2}{4\pi^2 c^2} \quad (\because v = \frac{c}{\lambda})$$

$$\begin{aligned}\Rightarrow \lambda &= \sqrt{4\pi^2 c^2 LC} \\ &= \sqrt{4 \times \pi^2 \times (3 \times 10^8)^2 \times 10^{-8} \times 2.4 \times 10^{-6}} \\ &= 292\text{m}\end{aligned}$$

---

## Question 61

The work function for a metal is 3.6V and threshold wavelength is 3000Å. If work function for another metal is 1.8eV, then threshold wavelength must be

**Options:**

- A. 6000Å
- B. 5600Å
- C. 5200Å
- D. 4800Å

**Answer: A**

**Solution:**

**Solution:**

(a) Given, work function of metal,  $\phi_1 = 3.6\text{eV}$

Threshold wavelength,  $\lambda_1 = 3000\text{Å}$

Work function for another metal,  $\phi_2 = 1.8\text{eV}$

Threshold wavelength,  $\lambda_2 = ?$

According to Einstein's photoelectric equation,

$$\frac{hc}{\lambda_0} = \phi_0$$

$$\text{Therefore, } \frac{\frac{hc}{\lambda_1}}{\frac{hc}{\lambda_2}} = \frac{\phi_1}{\phi_2} = \frac{3.6}{1.8}$$

$$\Rightarrow \lambda_2 = 2 \times \lambda_1$$

$$\Rightarrow \lambda_2 = 6000\text{\AA}$$

---

## Question 62

If the ionisation energy for the hydrogen atom is 13.6eV, then the energy required to excite it from the ground state to the next higher state is nearly

**Options:**

A. 13.6eV

B. -3.4eV

C. 10.2eV

D. -10.2eV

**Answer: C**

**Solution:**

**Solution:**

(c) Given,  $E_1 = 13.6\text{eV}$

Energy of H-atom in nth excited state is

$$E_n = -\frac{13.6}{n^2}\text{eV}$$

For

$$n = 2, E_2 = -\frac{13.6}{2^2} = -3.4\text{eV}$$

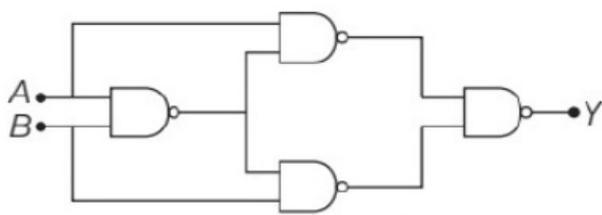

So, energy required to excite H-atom from ground state to next higher state is

$$E = E_2 - E_1 = -3.4 - (-13.6) = 10.2\text{eV}$$

---

## Question 63

The output Y of the logic circuit shown is

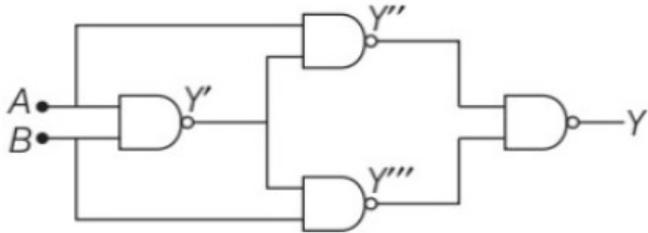

**Options:**

- A.  $A \cdot \bar{B} + A \cdot B$
- B.  $\bar{A} \cdot B + A \cdot \bar{B}$
- C.  $\bar{A} \cdot \bar{B} + A \cdot B$
- D.  $A \cdot \bar{B} + \bar{A} \cdot \bar{B}$

**Answer: C****Solution:****Solution:**

(c) The respective output of each logic gate is shown below

$$\begin{aligned}
 \text{Here, } Y' &= \overline{A \cdot B} = \bar{A} + \bar{B} \\
 Y'' &= A \cdot (A + B) = \bar{A} + (A + B) \\
 &[\text{By de Morgan's theorem}] \\
 &= \bar{A} + (\bar{A} \cdot \bar{B}) = \bar{A} + (A \cdot B) \\
 Y''' &= B \cdot (A + B) = \bar{B} + (A + B) = \bar{B} + (\bar{A} \cdot \bar{B}) \\
 &= \bar{B} + (A \cdot B) \\
 Y &= \overline{Y'' \cdot Y'''} = \overline{A + (A \cdot B) \cdot [\bar{B} + (A \cdot B)]} \\
 &= \overline{[A + A \cdot B] + [B + (A \cdot B)]} \\
 &= \bar{A} \cdot (\bar{A} \cdot \bar{B}) + \bar{B} \cdot (\bar{A} \cdot \bar{B}) \\
 &= A(\bar{A}\bar{B}) + B(\bar{A}\bar{B}) \\
 &= (\bar{A} + B)(\bar{A} \cdot \bar{B}) = (\bar{A} + B)(\bar{A} + \bar{B}) \\
 &= \bar{A}\bar{A} + \bar{A}\bar{B} + \bar{B}\bar{A} + \bar{B}\bar{B} \\
 &= 0 + \bar{A}\bar{B} + \bar{B}\bar{A} + 0 \\
 &= \bar{A} \cdot \bar{B} + \bar{A} \cdot \bar{B}
 \end{aligned}$$

**Question 64**

**In a single slit diffraction pattern, width of slit is  $a$ . The first minimum is observed at angle of  $45^\circ$ . When light of wavelength  $6000\text{\AA}$  is incident on the slit. The first secondary maximum is observed at an angle of**

**Options:**

- A.  $\sin^{-1}\left(\frac{1}{\sqrt{2}}\right)$
- B.  $\sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$
- C.  $\sin^{-1}\left(\frac{3}{2\sqrt{2}}\right)$
- D. Zero

©

**Answer: C**

**Solution:**

**Solution:**

(c) For the first minima,  $\sin \theta = \frac{\lambda}{a}$

$$\Rightarrow \frac{\lambda}{a} = \sin 45^\circ = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \frac{\lambda}{a} = \frac{1}{\sqrt{2}} \dots\dots\dots (i)$$

For first secondary maximum,  $\sin \theta = \frac{3\lambda}{2a} = \frac{3}{2} \times \frac{1}{\sqrt{2}}$

[From Eq. (i)]

$$\Rightarrow \theta = \sin^{-1} \left( \frac{3}{2\sqrt{2}} \right)$$

---

## Question 65

**A beam of light of wavelength 600nm from a distant source falls on a single-slit 1mm wider and the resulting diffraction pattern is observed on a screen 2m away. The distance between first dark on either side of the central bright fringes is**

**Options:**

- A. 1.2cm
- B. 1.2mm
- C. 2.4cm
- D. 2.4mm

**Answer: D**

**Solution:**

**Solution:**

(d) Distance between the first dark fringes on either side of the central bright fringe = width of central maxima

$$\Rightarrow 2y = \frac{2\lambda D}{d}$$

Here,  $\lambda = 600\text{nm} = 600 \times 10^{-9}\text{m}$

$d = 1\text{mm} = 1 \times 10^{-3}\text{m}$

$D = 2\text{m}$

$$\Rightarrow 2y = \frac{2 \times 600 \times 10^{-9} \times 2}{1 \times 10^{-3}} = 24 \times 10^{-4}\text{m} = 2.4 \text{ mm}$$

---

## Question 66

**Eight dipoles of charges of magnitude e each one placed inside a cube.**

**The total flux coming out of the cube will be**

©

**Options:**

- A.  $\frac{8e}{\epsilon_0}$
- B.  $\frac{16e}{\epsilon_0}$
- C.  $\frac{e}{\epsilon_0}$
- D. Zero

**Answer: D**

**Solution:**

**Solution:**

(d) Net charge of one dipole =  $-e + e = 0$

Net charge of 8 dipoles =  $8 \times 0 = 0$

$\therefore$  Net charge inside cube,  $q = 0$

By Gauss's law

Total flux emerging out from surface =  $\frac{q}{\epsilon_0} = 0$

---

## Question 67

**A parallel plate air capacitor has a capacitance  $18\mu\text{F}$ . If the distance between the plates is tripled and a dielectric medium is introduced, the capacitance becomes  $72\mu\text{F}$ . The dielectric constant of the medium is**

©

**Options:**

- A. 4
- B. 9
- C. 12
- D. 2

**Answer: C**

**Solution:**

**Solution:**

(c) For air capacitor,  $C_0 = \frac{\epsilon_0 A}{d} = 18\mu\text{F}$

When dielectric slab is introduced between plates and distance is tripled, then

$C = \frac{K \epsilon_0 A}{3d} = 72\mu\text{F}$

Dividing Eq. (ii) by Eq. (i), we get

$$\frac{K}{3} = \frac{72}{18} \Rightarrow K = 12$$

---

## Question 68

Two bar magnet having magnetic dipole moments  $4A - m^2$  and  $5A - m^2$  are kept as shown below. The resultant dipole moment will be

**Options:**

- A.  $\sqrt{21}Am^2$
- B.  $\sqrt{41}Am^2$
- C.  $\sqrt{61}A - m^2$
- D.  $\sqrt{31}A - m^2$

**Answer: C**

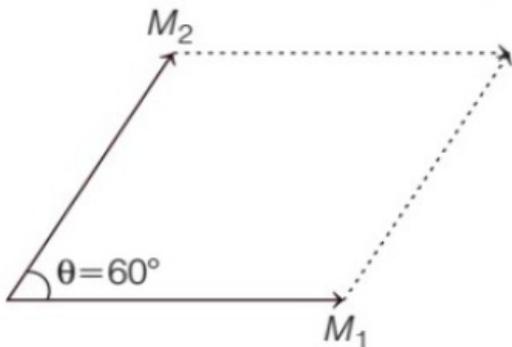

**Solution:**

**Solution:**

(c) Here,

$$M_1 = 4A - m^2$$

$$M_2 = 5A - m^2$$

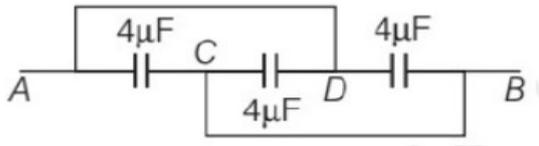

According to parallelogram law of vector addition, resultant dipole moment  $M$

$$\begin{aligned} M &= \sqrt{M_1^2 + M_2^2 + 2M_1M_2 \cos 60^\circ} \\ &= \sqrt{4^2 + 5^2 + 2 \times 4 \times 5 \times \cos 60^\circ} = \sqrt{61}A - m^2 \end{aligned}$$

---

## Question 69

The equivalent capacitance between points A and B is

Options:

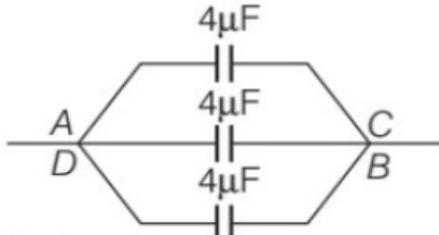

- A.  $\frac{4}{3}\mu\text{F}$
- B.  $3\mu\text{F}$
- C.  $4\mu\text{F}$
- D.  $12\mu\text{F}$

Answer: D

Solution:

Solution:

The given circuit diagram is drawn as

Hence, given capacitors are in parallel combination.

$$\therefore C_{AB} = 4 + 4 + 4 = 12\mu\text{F}$$

## Question 70

A point charge Q is placed at the centre of a cube. The flux linked with the each face of the cube is

Options:

- A.  $\frac{Q}{6\epsilon_0}$
- B.  $\frac{Q}{\epsilon_0}$
- C.  $\frac{Q}{12\epsilon_0}$
- D.  $\frac{Q}{8\epsilon_0}$

Answer: A

## Solution:

### Solution:

(a) The cube is a symmetrical body with 6 faces and the point charge is at its centre, so electric flux linked with each face will be

$$\phi = \frac{\phi_{\text{total}}}{6} = \frac{Q}{6\epsilon_0}$$

---

## Question 71

**Maximum velocity of photoelectrons emitted from a metal surface is  $v_1$  when frequency of incident radiation is  $2\nu$ . When frequency of incident radiation is increased to  $5\nu$ , then maximum velocity of emitted photoelectrons becomes  $v_2$ . The ratio  $v_1 : v_2$  will be**

### Options:

- A. 1 : 4
- B. 4 : 1
- C. 1 : 2
- D. 2 : 1

**Answer: C**

### Solution:

#### Solution:

(c) According to Einstein's photoelectric equation, maximum energy of emitted electrons is given by

$$K_{\text{max}} = \frac{1}{2}mv_{\text{max}}^2 = h\nu - h\nu_0$$

$$\Rightarrow \frac{1}{2}mv_{\text{max}}^2 = h(\nu - \nu_0) \quad \dots\dots (i)$$

When, frequency of incident radiation, becomes  $2\nu$ , then velocity of emitted electron is  $v_1$ , hence from Eq. (i), we get

$$\frac{1}{2}mv_1^2 = h(2\nu - \nu_0)$$

$$\frac{1}{2}mv_1^2 = h\nu_0 \quad \dots\dots (ii)$$

Again, when frequency becomes  $5\nu_0$ , the velocity of emitted electron is  $v_2$ .

$\therefore$  From Eq. (i), we have

$$\frac{1}{2}mv_2^2 = h(5\nu - \nu)$$

$$\Rightarrow \frac{1}{2}mv_2^2 = 4h\nu$$

Dividing Eq. (ii) by Eq. (iii), we get

$$\frac{\frac{1}{2}mv_1^2}{\frac{1}{2}mv_2^2} = \frac{h\nu}{4h\nu}$$

$$\Rightarrow \left(\frac{v_1}{v_2}\right)^2 = \left(\frac{1}{2}\right)^2$$

$$\Rightarrow v_1 : v_2 = 1 : 2$$

©

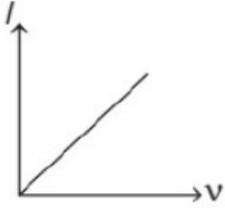

---

## Question 72

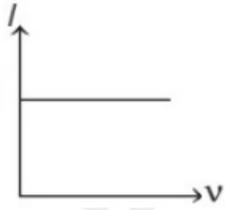

Which of the following graphs shows correct variation of photoelectric current / with frequency of incident radiation?

Options:

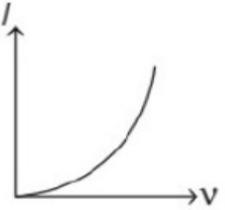

A.

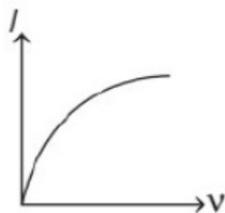

B.

C.

D.

**Answer: B**

**Solution:**

**Solution:**

Since, photoelectric current (  $I$  ) does not depend on the frequency (  $\nu$  ) of incident radiation. Hence, graph showing in option (b) is correct.

---

## Question 73

The frequency of a stretched uniform wire of length  $L$  under tension is in resonance with the fundamental frequency of air column in a closed pipe of the same length. If the tension in the wire is increased by  $8\text{N}$ , it is in resonance with the first overtone of the same closed pipe. The initial tension in the wire is

**Options:**

- A.  $3\text{N}$
- B.  $4\text{N}$
- C.  $1\text{N}$
- D.  $2\text{N}$

**Answer: C**

**Solution:**

**Solution:**

(c) As we know the, frequency of sound wave produced in a stretched wire is directly proportional to square root of tension in the wire

i.e.,  $f \propto \sqrt{T}$

Let  $T$  be the initial tension.

Therefore, for air column,  $f_c \propto \sqrt{T}$  ..... (i)

According to question, first overtone

i.e.,  $3f_c \propto \sqrt{T + 8}$  ..... (ii)

From Eq. (i) and Eq. (ii), we get

$$\frac{f_c}{3f_c} = \frac{\sqrt{T}}{\sqrt{T + 8}}$$

$$\Rightarrow T + 8 = 9T$$

$$\Rightarrow T = 1\text{N}$$

---

## Question 74

A vertical column  $50\text{cm}$  long at  $50^\circ\text{C}$  balances another column of same liquid  $60\text{cm}$  long at  $100^\circ\text{C}$ . The coefficient of absolute expansion of the liquid is

**Options:**

- A.  $0.002 / ^\circ\text{C}$
- B.  $0.003 / ^\circ\text{C}$
- C.  $0.004 / ^\circ\text{C}$
- D.  $0.005 / ^\circ\text{C}$

**Answer: D**

**Solution:**

**Solution:**(d) Given,  $h_1 = 50\text{cm}$ ,  $T_1 = 50^\circ\text{C}$  $h_2 = 60\text{cm}$ ,  $T_2 = 100^\circ\text{C}$ Let the density of the given liquid at STP be  $\rho_0$ , if both vertical columns balance each other, then their pressure should be equal.i.e.,  $p = \rho gh$ 

$$\Rightarrow \rho_1 gh_1 = \rho_2 gh_2$$

$$\Rightarrow \frac{\rho_1}{\rho_2} = \frac{h_2}{h_1}$$

If  $r$  be the coefficient of absolute expansion of liquid, then,  $\rho_1 = \frac{\rho_0}{1 + rT_1}$  and  $\rho_2 = \frac{\rho_0}{1 + rT_2}$  $\therefore$  From Eq. (i) we have

$$\frac{\frac{\rho_0}{1 + rT_1}}{\frac{\rho_0}{1 + rT_2}} = \frac{h_2}{h_1} = \frac{60}{50}$$

$$\Rightarrow \frac{1 + rT_2}{1 + rT_1} = \frac{6}{5} \Rightarrow 5rT_2 - 6rT_1 = 1$$

$$\Rightarrow r = \frac{1}{200} = 0.005 / ^\circ\text{C}$$

## Question 75

**A source of sound emitting a note of frequency  $n$  is approaching a stationary listener. If the frequency of the note heard by the listener is  $2n$ , the velocity of the source versus is equal to [ $v$  = velocity of sound in air]**

**Options:**A.  $2v$ B.  $\frac{2v}{3}$ C.  $\frac{v}{2}$ D.  $\frac{v}{4}$ **Answer: C****Solution:****Solution:**

(c) The Doppler's effect in sound is given by

$$f_o = \frac{v + v_o}{v + v_s} f_s$$

where,  $f_o$  = observer frequency of sound, $v$  = speed of sound waves, $v_o$  = observer velocity, $v_s$  = source velocityand  $f_s$  = actual frequency of sound wave.

Thus, according to question,

$$2n = \left( \frac{v+0}{v+v_s} \right) n$$

$$\Rightarrow 2(v+v_s) = v$$

$$\Rightarrow 2v + 2v_s = v$$

$$-2v_s = v$$

$$v_s = -\frac{v}{2}$$

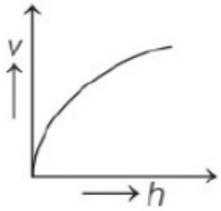

where -ve sign shows that source is approaching to the listener.

## Question 76

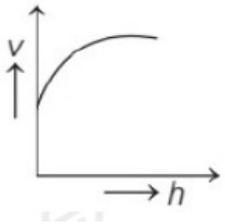

A uniform rope having a mass  $m$  is suspended with a rigid support. It is struck as its lower end. The speed of transverse wave  $v$  produced in this way will vary with height  $h$  as

Options:

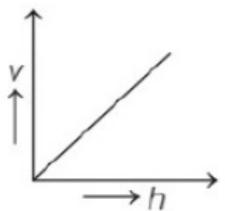

A.

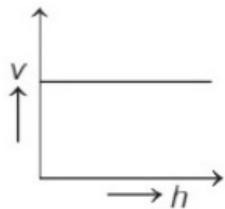

B.

C.

D.

**Answer: A**

**Solution:**

**Solution:**

(a) Let  $m$  be the total mass of the rope of length  $L$ . Tension in the rope at a height  $h$  from lower end = weight of rope length  $h$ ,

i.e.,

As

$$T = \frac{mg}{L}h$$

$$v = \sqrt{\frac{T}{\left(\frac{m}{L}\right)}}$$

$$v = \sqrt{\frac{mg(h)}{L\left(\frac{m}{L}\right)}} = \sqrt{gh}$$

$$\Rightarrow v^2 = gh$$

Which represents a parabola symmetric along  $h$ -axis.

Thus, option (a) represents the correct graph.

## Question 77

**A thin prism  $P_1$  with angle  $4^\circ$  and made from glass of refractive index 1.54 is combined with another thin prism  $P_2$  made from glass of refractive index 1.72 to produce dispersion without deviation. The angle of prism  $P_2$  is**

**Options:**

- A.  $2.6^\circ$
- B.  $5.33^\circ$
- C.  $3^\circ$
- D.  $4^\circ$

**Answer: C**

**Solution:**
**Solution:**

(c) For dispersion without deviation,

$$\frac{A}{A_1} = \frac{\mu - 1}{\mu - 1}$$

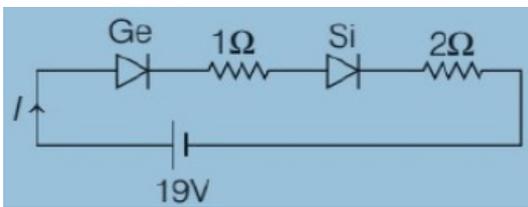

$$\Rightarrow \frac{4}{A_1} = \frac{1.72 - 1}{1.54 - 1} = \frac{0.72}{0.54}$$

$$\Rightarrow A_1 = \frac{4 \times 0.54}{0.72} = 3^\circ$$

## Question 78

**A silicon and germanium diode is connected in series as shown below**

**The current flowing through the circuit will be**

**Options:**

- A. 6A
- B. 3A
- C. 2A
- D. 1A

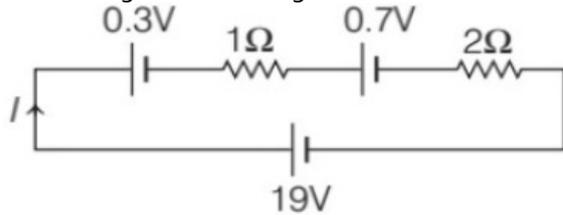

**Answer: A**

**Solution:**

**Solution:**

(a) We know that, barrier potential of Ge,  $V_{B_1} = 0.3 \text{ V}$  and barrier potential of Si,  $V_{B_2} = 0.7 \text{ V}$

Redrawing the above figure as

Applying KVL, we get

$$-19 + 0.3 + 1 \cdot I + 0.7 + 2I = 0$$

$$\Rightarrow 3I = 18 \Rightarrow I = 6 \text{ A}$$

## Question 79

**In hydrogen atom, an electron jumps from third excited state to ground state, then frequency of emitted light will be**

**[Take,  $h = 6.63 \times 10^{-34} \text{ J} \cdot \text{s}$  ]**

**Options:**

- A.  $1.5 \times 10^{14} \text{ Hz}$
- B.  $3 \times 10^{15} \text{ Hz}$
- C.  $4 \times 10^{13} \text{ Hz}$
- D.  $6.5 \times 10^{12} \text{ Hz}$

**Answer: B**

**Solution:**

**Solution:**

(b) Energy of electron in nth orbit in H-atom,

$$E_n = \frac{-13.6}{n^2} \text{eV}$$

For third excited state,  $n = 4$ 

$$\therefore E_4 = \frac{-13.6}{4^2} = -0.85 \text{eV}$$

For ground state,  $n = 1$ 

$$\therefore E_1 = \frac{-13.6^2}{1^2} = -13.6 \text{eV}$$

If  $\nu$  be the frequency of emitted photon, then

$$\begin{aligned} h\nu &= E_4 - E_1 \\ &= -0.85 - (-13.6) \\ &= -0.85 + 13.6 = 12.75 \text{eV} \end{aligned}$$

$$\begin{aligned} \nu &= \frac{12.75 \times 1.6 \times 10^{-19}}{h} \\ &= \frac{12.75 \times 16 \times 10^{-19}}{6.63 \times 10^{-34}} = 3 \times 10^{15} \text{Hz} \end{aligned}$$

## Question 80

**An asteroid is falling towards the centre of earth under the influence of earth's gravitational field. At  $10R_e$  ( $R_e =$  radius of earth) it has speed of  $12 \text{km / s}$ . What will be the speed of the asteroids when it hits the earth's surface?**

**Options:**

- A.  $12.4 \text{km / s}$
- B.  $14.6 \text{km / s}$
- C.  $16 \text{km / s}$
- D.  $18 \text{km / s}$

**Answer: C****Solution:****Solution:**

(c) According to conservation of energy,

Total energy of asteroid at  $10R_e =$  Total energy of asteroid at surface of earth

$$\Rightarrow U_1 + K_1 = U_2 + K_2$$

$$\Rightarrow \frac{-GM_e m}{10R_e} + \frac{1}{2}mv_0^2 = \frac{-Gm_e m}{R_e} + \frac{1}{2}mv^2$$

$$\Rightarrow \frac{9}{10} \frac{GM_e m}{R_e} + \frac{1}{2}mv_0^2 = \frac{1}{2}mv^2$$

$$\Rightarrow \frac{9}{10} \times \frac{2GM}{R_e} + v_0^2 = v^2$$

$$\Rightarrow v^2 = \frac{9}{10}(v_e)^2 + v_0^2$$

where,  $v_e =$  escape velocity  $= 11.2 \text{km / s}$ 

$$\Rightarrow v^2 = \frac{9}{10} \times (11.2)^2 + (12)^2$$

$$= \frac{9}{10} \times (11.2)^2 + 144 = 16 \text{kms}^{-1}$$

## Question 81

A geostationary satellite at 36000km height has 24h time period. The time-period of a spy satellite at  $R = 6400\text{km}$  will be

**Options:**

- A. 1.2h
- B. 1.3h
- C. 1.53h
- D. 2h

**Answer: C**

**Solution:**

**Solution:**

(c) For time period of a satellite, we can write

$$T = \frac{2\pi r}{v} = \frac{2 \times r}{\sqrt{\frac{GM}{r}}} = 2\pi \left( \frac{r^3}{GM} \right)^{1/2}$$

According to question,

$$24 = 2\pi \left[ \frac{(6400 + 36000)^3}{GM} \right]^{1/2}$$

$$\text{and for spy satellite, } T' = 2\pi \left[ \frac{(6400)^3}{GM} \right]^{1/2}$$

$$\therefore \frac{T'}{24} = \left[ \frac{(6400)^3}{(6400 + 36000)^3} \right]^{1/2}$$

$$\Rightarrow T' = (24) \times (0.4)^3$$

$$\Rightarrow T' = 1.53\text{h}$$

## Question 82

A lead bullet at  $27^\circ\text{C}$  melts when hit on a target. Assuming only 75% of heat is used to melt the bullet, the velocity of bullet at time of striking is

(Take, melting point of lead =  $327^\circ\text{C}$ , specific heat of lead =  $0.03\text{cal / g}^\circ\text{C}$ , latent heat of fusion of lead =  $6\text{cal / g}$ )

**Options:**

- A. 330m / s
- B. 410m / s
- C. 470m / s

D. 510m / s

**Answer: B**

**Solution:**

**Solution:**

(b) Let mass of the bullet be  $m$  gram, then total heat required for bullet to just melt down

$$Q_1 = mc \Delta T + mL$$

$$= m \times (0.03)(327 - 27) + m \times 6$$

$$= 15m - \text{cal}$$

$$= (16m \times 4.2) \text{J}$$

Now, when bullet is struck by obstacles, the loss in its mechanical energy

$$= \frac{1}{2}(m \times 10^{-3})v^2$$

The energy absorbed by bullet,

$$Q_2 = \frac{72}{100} \times \frac{1}{2}mv^2 \times 10^{-3}$$

$$= \frac{3}{8}mv^2 \times 10^{-3} \text{J}$$

Now, the bullet will melt if  $Q_2 \geq Q_1$

$$\text{i.e., } \frac{3}{8}mv^2 \times 10^{-3} \geq 15m \times 4.2$$

$$\Rightarrow v_{\min} = 410 \text{ m / s}$$

## Question 83

**A cell can be balanced against 120cm and 100cm of potentiometer wire, respectively.**

**When in open circuit and when short-circuited through a resistance of  $10\Omega$ , then the internal resistance of the cell is**

**Options:**

A.  $1\Omega$

B.  $1.5\Omega$

C.  $2\Omega$

D.  $0.5\Omega$

**Answer: C**

**Solution:**

**Solution:**

(c) Given,  $l_1 = 120\text{cm}$ ,  $l_2 = 100\text{cm}$

$R = 10\Omega$ ,  $r = ?$

$$\therefore r = \left( \frac{l_1}{l_2} - 1 \right) R$$

$$= \left( \frac{120}{100} - 1 \right) \times 10 = \frac{20}{100} \times 10 = 2\Omega$$

©

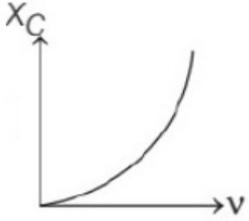

## Question 84

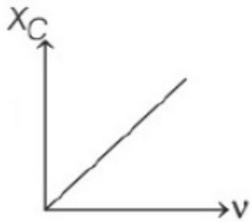

Which of the following curves shows correct variation of capacitive reactance  $X_C$  with frequency  $\nu$  ?

Options:

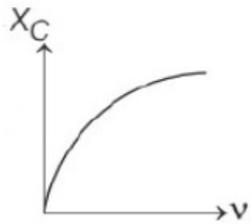

A.

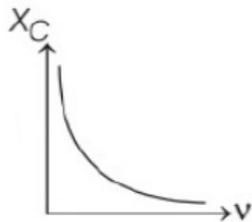

B.

C.

D.

**Answer: D**

**Solution:**

**Solution:**

(d) We know that, capacitive reactance,

$$X_C = \frac{1}{\omega C} = \frac{1}{2\pi\nu C}$$

$$\Rightarrow X_C \propto \frac{1}{\nu}$$

Hence, graph shown in option (d) represents correct variation of  $X_C$  with  $\nu$ .

## Question 85

An  $\alpha$ -particle and a proton, accelerated through same potential difference, enter into a region of uniform magnetic field with their velocities perpendicular to the field. If radius of circular path traversed by proton is  $\sqrt{2}$ cm, then radius of circular path traversed by  $\alpha$ -particle is

Options:

- A. 1cm
- B. 2cm
- C. 3cm
- D. 4cm

Answer: B

Solution:

Solution:

(b) We know that, radius of circular path in magnetic field B,

$$r = \frac{mv}{Bq}$$

When a charge  $q$  is accelerated by  $V$  volts, it acquires a kinetic energy,  $E_k = qV$

$$\therefore \text{Momentum } p = \sqrt{2mE_k} = \sqrt{2mqV}$$

$$\Rightarrow mv = \sqrt{2mqV}$$

From Eq. (i) and (ii), we get

$$cr = \sqrt{\frac{2mqV}{Bq}} = \sqrt{\frac{2mV}{qB^2}}$$

$$\text{Thus, } \frac{r_\alpha}{r_p} = \sqrt{\frac{m_\alpha}{m_p}} \sqrt{\frac{q_p}{q_\alpha}} = \sqrt{\frac{4m_p}{q_\alpha}} \cdot \sqrt{\frac{q_p}{2q_p}} = \sqrt{2}$$

$$\Rightarrow r_\alpha = \sqrt{2}r_p = \sqrt{2} \times \sqrt{2} = 2\text{cm}$$

## Question 86

If two waves of the same frequency and amplitude respectively on superposition produce a resultant disturbance of the same amplitude. The waves differ in phase by

Options:

- A.  $\frac{\pi}{2}$
- B.  $\frac{\pi}{6}$
- C.  $\frac{2\pi}{3}$

D.  $\frac{\pi}{4}$

**Answer: C**

**Solution:**

**Solution:**

(c) According to given situation,

$$a_1 = a_2 = a = a_R \text{ (resultant)}$$

$$\therefore a_R = \sqrt{a_1^2 + a_2^2 + 2a_1a_2 \cos \varphi}$$

$$a = \sqrt{a^2 + a^2 + 2a^2 \cos \varphi}$$

$$a^2 = 2a^2(1 + \cos \varphi)$$

$$\Rightarrow 1 + \cos \varphi = 1 / 2$$

$$\Rightarrow \cos \varphi = -\frac{1}{2} \Rightarrow \varphi = \frac{2\pi}{3}$$

## Question 87

The radii of two columns in a U-tube are  $r_1$  and  $r_2$ . When a liquid of density  $\rho$  (angle of contact =  $0^\circ$ ) is filled in it, the level difference of liquid in two arms is  $h$ . The surface tension of liquid is

**Options:**

A.  $\frac{(r_1 - r_2)\rho gh}{2r_1r_2}$

B.  $\frac{r_1r_2\rho gh}{(r_1 - r_2)}$

C.  $\frac{r_1r_2\rho gh}{2(r_2 - r_1)}$

D.  $\frac{r_1r_2(\rho gh)}{2(r_1 - r_2)}$

**Answer: C**

**Solution:**

**Solution:**

(c) The height of liquid in tube of radius  $r_1$  is

$$h_1 = \frac{2T \cos \theta}{r_1 \rho g} = \frac{2T}{r_1 \rho g}$$

( $\because \theta = 0^\circ$ )

Similarly, for tube of radius  $r_2$ ,

$$h_2 = \frac{2T}{r_2 \rho g}$$

Given,  $h = h_1 - h_2$

$$= \frac{2T}{\rho g} \left( \frac{1}{r_1} - \frac{1}{r_2} \right) = \frac{2T(r_2 - r_1)}{\rho g r_1 r_2}$$

$$\Rightarrow T = \frac{r_1 r_2 \rho g h}{2(r_2 - r_1)}$$

©

---

## Question 88

The ratio of the wavelength of the last line of the Balmer series to last line of Lyman series is

Options:

- A. 1 : 2
- B. 2 : 1
- C. 4 : 1
- D. 1 : 4

Answer: C

Solution:

Solution:

(c) Wavelength of spectral line in hydrogen atom ( $Z = 1$ ) given as

$$\frac{1}{\lambda} = R \left[ \frac{1}{n_1^2} - \frac{1}{n_2^2} \right] \dots (i) \quad [\because Z = 1]$$

For last line of Lyman series,

$$n_1 = 1 \text{ and } n_2 = \infty$$

$\therefore$  From Eq. (i), we have

$$\frac{1}{\lambda_L} = R \left( \frac{1}{1^2} - \frac{1}{\infty} \right) = R$$

$$\Rightarrow \lambda_L = \frac{1}{R} \dots \dots \dots (ii)$$

Similarly, for last line of Balmer series,  $n_1 = 2$  and  $n_2 = \infty$

$\therefore$  From Eq. (i), we get

$$\frac{1}{\lambda_B} = R \left( \frac{1}{2^2} - \frac{1}{\infty} \right) = \frac{R}{4}$$

$$\Rightarrow \lambda_B = \frac{4}{R}$$

Hence, from Eq. (i) and Eq. (ii), we get

$$\frac{\lambda_L}{\lambda_B} = \frac{1/R}{4/R} = \frac{1}{4}$$

$$\text{or } \lambda_L : \lambda_B = 1 : 4$$

$$\Rightarrow \lambda_B : \lambda_L = 4 : 1$$

---

## Question 89

A body of mass  $m$  is tied to one end of a spring and whirled round in a horizontal circle with a constant angular velocity. The elongation in the spring is 1cm. If the angular velocity is doubled, the elongation in the spring is 5cm. The original length of the spring is

# Exam Bro

CLICK HERE!

Download Now

**Options:**

- A. 13cm
- B. 15cm
- C. 14cm
- D. 16cm

**Answer: B****Solution:****Solution:**(b) Let original length be  $x$ cm.Initial angular velocity be  $\omega$ .Elongation,  $d x = 1$ cmAccording to Newton's law  $F = -k d x = \frac{m v^2}{r} \Rightarrow -k d x = m \omega^2 r$ Since,  $r = (x + 1)$  and  $d x = 1$ cmTherefore,  $-k(1) = m \omega^2 (x + 1)$ 

...(i)

Again angular velocity is doubled and elongation produced is 5cm.

Therefore,  $-k(5) = m(2\omega)^2(x + 5)$  $-5k = 4m\omega^2(x + 5)$ 

From Eq. (i) and Eq. (ii), we get

$$\frac{5k}{k} = \frac{4m\omega^2(x + 5)}{m\omega^2(x + 1)}$$

$$\Rightarrow (x + 1)5 = 4(x + 5)$$

$$\Rightarrow 5x + 5 = 4x + 20$$

$$\Rightarrow 5x - 4x = 20 - 5$$

$$\Rightarrow x = 15\text{cm}$$

**Question 90**

**A particle is moving in a circle of radius  $R$  with constant speed  $v$ . The magnitude of average acceleration after half revolution is**

**Options:**

A.  $\frac{v^2}{2\pi R}$

B.  $\frac{2v^2}{\pi R}$

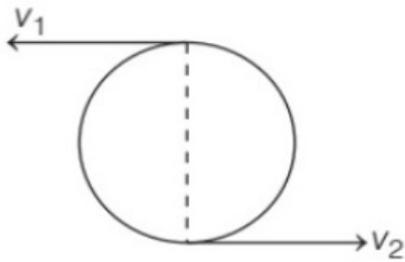

C.  $\frac{2v^2}{\pi R^2}$

D.  $\frac{v^2}{\pi R}$

**Answer: B****Solution:****Solution:**

(b) For half revolution, the position of the particle is given below,

Let velocity be  $v$ .

Change in velocity =  $v_2 - v_1 \Rightarrow v(-v) = 2v$

Time taken by the particle to cover half revolution

$$\therefore = \frac{\pi R}{v}$$

$$\therefore \text{Average acceleration} = \frac{\text{Velocity}}{\text{Time}} = \frac{2v}{\frac{\pi R}{v}} = \frac{2v^2}{\pi R}$$

## Question 91

For a given gas at 1atm pressure, rms speed of the molecules is 100m / s at 27°C. At 2atm pressure and at 927°C temperature, the rms speed of the molecules will be

Options:

- A. 50m / s
- B. 100m / s
- C. 200m / s
- D. 400m / s

Answer: C

Solution:

Solution:

(c) Given,  $T_1 = 27 + 273 = 300\text{K}$   $T_2 = 927 + 273 = 1200\text{K}$

$(v_{\text{rms}})_1 = 100\text{m / s}$

$(v_{\text{rms}})_2 = ?$

We know that,  $v_{\text{rms}} \propto \sqrt{T}$

$$\frac{(v_{\text{rms}})_2}{(v_{\text{rms}})_1} = \sqrt{\frac{T_2}{T_1}} = \sqrt{\frac{1200}{300}} = 2$$

$$(v_{\text{rms}})_2 = 2 \times (v_{\text{rms}})_1 = 2 \times 100 = 200\text{m / s}$$

## Question 92

The magnitude of electric field intensity that balances the weight of an  $\alpha$ -particle is

[Take, mass of proton,  $m_p = 1.67 \times 10^{-27}\text{kg}$ ,  $g = 10\text{m / s}^2$  and  $e = 1.6 \times 10^{-19}\text{C}$  ]

**Options:**

- A.  $3.3 \times 10^{-6} \text{N / C}$   
 B.  $4.2 \times 10^{-8} \text{N / C}$   
 C.  $2.5 \times 10^{-9} \text{N / C}$   
 D.  $2.1 \times 10^{-7} \text{N / C}$

**Answer: D****Solution:****Solution:**

. (d) For equilibrium of  $\alpha$ -particle,

$$qE = mg$$

$$\Rightarrow E = \frac{mg}{q}$$

$$= \frac{4m_p \cdot g}{2e} = \frac{4 \times 167 \times 10^{-27} \times 10}{2 \times 1.6 \times 10^{-19}}$$

$$= 2.1 \times 10^{-7} \text{N / C}$$

**Question 93**

**A particle executes simple harmonic motion with an amplitude of 4cm. When the particle is at 2cm from the mean position, then the magnitude of its velocity is equal to that of its acceleration. Then, its time period is**

**Options:**

- A.  $\sqrt{3}\pi\text{s}$   
 B.  $\frac{\pi}{\sqrt{3}}\text{s}$   
 C.  $\pi\text{s}$   
 D.  $\frac{2\pi}{\sqrt{3}}\text{s}$

**Answer: B****Solution:****Solution:**

(b) Magnitude of velocity of particle when it is at displacement  $x$  from mean position.

$$v = \omega \sqrt{A^2 - x^2}$$

when  $x = 2\text{cm}$ , then

$$v = a$$

$$\Rightarrow \omega \sqrt{A^2 - x^2} = \omega^2 x$$

$$\Rightarrow \omega = \frac{\sqrt{A^2 - x^2}}{x} = \frac{\sqrt{4^2 - 2^2}}{2} = \frac{\sqrt{12}}{2} = \frac{4\sqrt{3}}{2}$$

$$\Rightarrow \omega = 2\sqrt{3} \text{ rad / s}$$

$$\therefore \text{Time period, } T = \frac{2\pi}{\omega} = \frac{2\pi}{2\sqrt{3}} = \frac{\pi}{\sqrt{3}} \text{ S}$$

---

## Question 94

**Molar specific heat capacity of an ideal gas at constant volume is  $\frac{3}{4}R$ , the molar specific heat capacity of the ideal gas at constant pressure will be**

**Options:**

A. 1.75R

B. 1.45R

C. 1.33R

D. 1.20R

**Answer: A**

**Solution:**

**Solution:**

(a) We know that, according to Mayer's formula,

$$C_p = C_v + R$$

$$= \frac{3}{4}R + R = \frac{7}{4}R = 1.75R$$

---

## Question 95

**Which of the following is correct for adiabatic process?**

**Options:**

A. Work done is independent of path.

B. Work done is equal to negative of change in internal energy.

C. Both (a) and (b)

D. Neither (a) nor (b)

**Answer: C**

**Solution:**

**Solution:**

(c) According to first law of dynamics.

$$\Delta Q = \Delta U + \Delta W$$

$$0 = \Delta U + \Delta W \Rightarrow \Delta W = -\Delta U$$

In adiabatic process, work done does not depend on the path, i.e., it is independent with path.

## Question 96

A force of  $(3\hat{i} + 2\hat{j} - \hat{k})$  N acts on a particle with position vector  $(\hat{i} + \hat{j} - \hat{k})$  m. The magnitude of torque of given force is

**Options:**

A.  $\sqrt{10}$ N - m

B.  $\sqrt{6}$ N - m

C.  $\sqrt{8}$ N - m

D.  $\sqrt{5}$ N - m

**Answer: B****Solution:****Solution:**

(b) Given,  $F = (3\hat{i} + 2\hat{j} - \hat{k})$  N

$$r = (\hat{i} + \hat{j} - \hat{k})\text{m}$$

$$\therefore \text{Torque, } \tau = r \times F = (\hat{i} + \hat{j} - \hat{k}) \times (3\hat{i} + 2\hat{j} - \hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & -1 \\ 3 & 2 & -1 \end{vmatrix}$$

$$= \hat{i}(-1 + 2) - \hat{j}(-1 + 3) + \hat{k}(2 - 3)$$

$$\tau = \hat{i} - 2\hat{j} - \hat{k}$$

$$\therefore \tau = |\tau| = \sqrt{1^2 + (-2)^2 + (-1)^2}$$

$$= \sqrt{1 + 4 + 1} = \sqrt{6}\text{N - m}$$

## Question 97

In the phenomena of refraction of light, which of the following characteristics remains unchanged?

**Options:**

A. Intensity

B. Amplitude

C. Frequency

D. Velocity

**Answer: C**

**Solution:**

**Solution:**

(c) In the phenomenon of refraction, frequency of light remains unchanged.

---

## Question 98

**A 2kW motor is used to pump water from a well 20m deep. The quantity of water pumped out per second is nearly [Take,  $g = 10\text{m} / \text{s}^2$  ]**

**Options:**

A. 10kg

B. 20kg

C. 5kg

D. 25kg

**Answer: A**

**Solution:**

**Solution:**

(a) Given,  $P = 2\text{kW} = 2 \times 10^3\text{W}$

$h = 20\text{m}$

$$\therefore P = \frac{W}{t}$$

$$P = \frac{mgh}{t}$$

$$\Rightarrow m = \frac{Pt}{gh} = \frac{2 \times 10^3 \times 1}{10 \times 20} = 10\text{kg}$$

---

## Question 99

**The angle of projection of a projectile for which horizontal range and height attain same magnitude is**

**Options:**

A.  $\tan^{-1}(2)$

B.  $\tan^{-1}(4)$

C.  $\tan^{-1}(3)$

D.  $\tan^{-1}(0.5)$

**Answer: B**

**Solution:**

**Solution:**

(b) Here,  $H = R$

$$\frac{u^2 \sin^2 \theta}{2g} = \frac{u^2 \sin 2\theta}{g}$$

$$\Rightarrow \frac{\sin^2 \theta}{2} = \sin 2\theta$$

$$\Rightarrow \frac{\sin^2 \theta}{2} = 2 \sin \theta \cos \theta$$

$$\Rightarrow \frac{\sin \theta}{\cos \theta} = 4 \Rightarrow \tan \theta = 4$$

$$\Rightarrow \theta = \tan^{-1}(4)$$

---

## Question 100

**A thin rod of length  $2l$  is rotating about an axis passing through its centre and perpendicular to its length. The radius of gyration of for the rod is**

**Options:**

A.  $\frac{l}{\sqrt{3}}$

B.  $\frac{l}{\sqrt{4}}$

C.  $\frac{l}{\sqrt{14}}$

D.  $\frac{l}{\sqrt{12}}$

**Answer: A**

**Solution:**

**Solution:**

(a) The moment of inertia of rod.

$$I = \frac{ML^2}{12} = \frac{M(2l)^2}{12} \text{ (Here, } L=2l\text{)}$$

$$I = \frac{Mk^2}{3}$$

$$Mk^2 = \frac{MI^2}{3} \text{ [ } k = \text{ radius of gyration]}$$

$$k = \frac{l}{\sqrt{3}}$$

©

## Question 1

Identify the last element in lanthanoid series.

Options:

- A. Nd
- B. Tm
- C. Lu
- D. Tb

Answer: C

Solution:

**Solution:**

Last element of lanthanoid series is Lu i.e. lutetium with atomic number 71 and mass number 175.5. It is a silver white metal, which resists corrosion in dry air, but not in moist air.

## Question 2

0.05F electricity is passed through  $\text{CuSO}_4$  solution. Calculate the mass of Cu produced at cathode? (molar mass of Cu =  $63.5\text{gmol}^{-1}$ )

Options:

- A. 3.17g
- B. 2.54g
- C. 0.795g
- D. 1.59g

Answer: D

Solution:

**Solution:**

Equivalent mass of copper

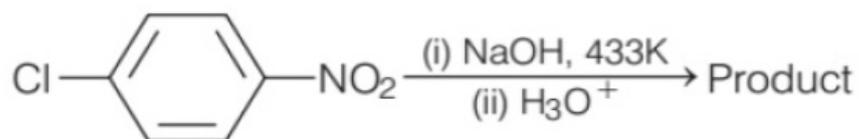

$$= \frac{\text{Atomic mass}}{\text{Valency}} = \frac{63.5}{2} = 31.75$$

Amount of copper deposited by 0.05F  
 $= 0.05 \times 3175 = 1.5875 \sim \text{eq}1.59\text{g}$

### Question 3

Identify the product obtained in the following reaction.

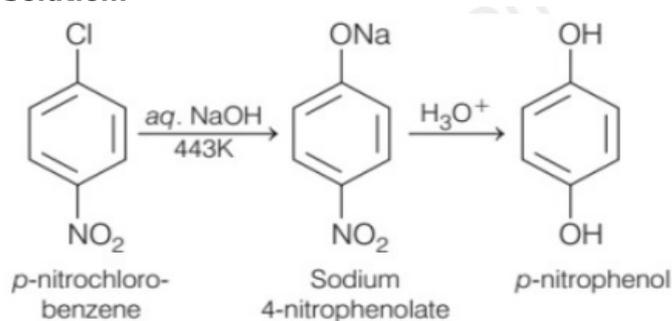

Options:

- A. o-nitrophenol
- B. m-nitrophenol
- C. p-nitrophenol
- D. None of these

Answer: C

Solution:

Solution:

### Question 4

Formation of gluconic acid from glucose by oxidation using Br<sub>2</sub> water

Options:

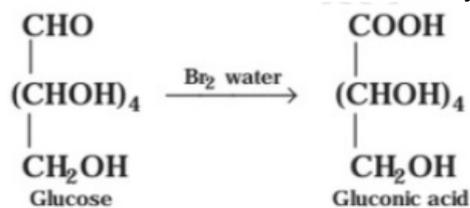

- A. glucose contains five hydroxyl groups.
- B. the presence of aldehyde group in glucose.
- C. glucose contains one primary alcoholic group.
- D. the six carbon atoms of glucose are in a straight chain.

Answer: B

Solution:

Solution:

Glucose gets oxidised to six carbon. Carboxylic acid (gluconic acid) on reaction with a mild oxidising agent like bromine water. This indicates that the carbonyl group is present as an aldehyde group.

## Question 5

What is the density of potassium, if it has bcc structure with edge length  $4\text{\AA}$  ?

(Atomic mass of K = 39 )

Options:

- A.  $3\text{gcm}^{-3}$
- B.  $2\text{gcm}^{-3}$
- C.  $5\text{gcm}^{-3}$
- D.  $4\text{gcm}^{-3}$

Answer: B

Solution:

Solution:

$$\text{For density, } \rho = \frac{Z \times M}{a^3 \times N_A}$$

$$\text{Edge length, } a = 4\text{\AA} = 4 \times 10^{-8}\text{cm}$$

$$\text{For bcc structure, } Z = 2$$

$$\begin{aligned} \rho &= \frac{2 \times 39}{(4 \times 10^{-8})^3 \times 6.022 \times 10^{23}} \\ &= 0.202 \times 10^{24} \times 10^{-23} \text{gcm}^{-3} \\ &= 0.202 \times 10 \text{gcm}^{-3} = 2.02 \text{gcm}^{-3} \end{aligned}$$

## Question 6

Which formula from following is used to determine molar mass of solute from depression in freezing point?

Options:

$$\text{A. } M_2 = \frac{1000 \times K_f \times W_1}{\Delta T_f \times W_2}$$

$$B. M_2 = \frac{1000 \times K_f \times W_2}{\Delta T_f \times W_1}$$

$$C. M_2 = \frac{1000 \times \Delta T_f \times W_2}{K_f \times W_1}$$

$$D. M_2 = \frac{1000 \times \Delta T_f \times W_1}{K_f \times W_2}$$

**Answer: B**

**Solution:**

**Solution:**

The formula used to determine the molar mass of solute from depression in freezing point is

$$M_2 = \frac{1000 \times K_f \times W_2}{\Delta T_f \times W_1}$$

where,  $W_2$  = weight of solute

$W_1$  = weight of solvent

$K_f$  = molal depression constant

## Question 7

**A gas is heated from 273K to 373K at 1atm pressure. If the initial volume of the gas is 10 L, its final volume would be**

**Options:**

A. 20d m<sup>3</sup>

B. 13.66d m<sup>3</sup>

C. 10d m<sup>3</sup>

D. 7.32d m<sup>3</sup>

**Answer: B**

**Solution:**

**Solution:**

$$T_1 = 273K$$

$$T_2 = 373K$$

$$V_1 = 10L$$

$$V_2 = ?$$

From Charles law,

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$\&V_2 = 373 \times \frac{10}{273} = 13.66L = 13.66d m^3$$

## Question 8

The ratio between the root mean square velocity of  $H_2$  at 50K and that of  $O_2$  at 800K is

©

**Options:**

- A. 4
- B. 2
- C. 1
- D. 0.25

**Answer: B**

**Solution:**

**Solution:**

$$T_1 = 50K \text{ for } H_2$$

$$T_2 = 800K \text{ for } O_2$$

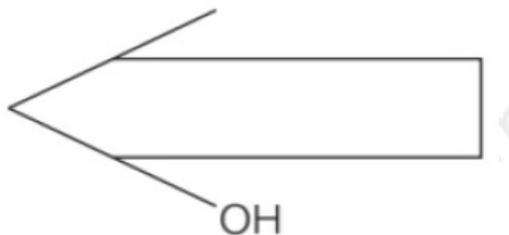

$$u_{ms} = \sqrt{\frac{3RT}{M}}$$

$$\Rightarrow \frac{u_{H_2}}{u_{O_2}} = \sqrt{\frac{T_1}{M_1} \times \frac{M_2}{T_2}} = \sqrt{\frac{50}{2} \times \frac{32}{800}} = 1$$

---

## Question 9

What is the IUPAC name of following compound?

**Options:**

- A. 1-methylcyclopentan-3-ol
- B. 3-hydroxy-1-methyl cyclopentane
- C. 3-methyl cyclopentanol
- D. 3-methylpentan-1-ol

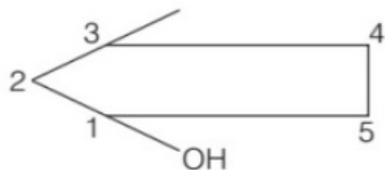

**Answer: C**

**Solution:**

**Solution:**

The correct IUPAC name of the given compound is 3-methylcyclopentanol.

## Question 10

An organic compound on analysis gave C = 42.8%, H = 7.2% and N = 50%. Volume of 1g of the compound was found to be 50mL at STP. Molecular formula of the compound is

Options:

- A.  $C_2H_4N_2$
- B.  $C_{12}H_{24}N_{12}$
- C.  $C_{16}H_{32}N_{16}$
- D.  $C_4H_8N_4$

Answer: C

Solution:

Solution:

Given, C = 42.8%, H = 7.2% and N = 50%

Element	%	Moles	Simplest ratio	Whole number
C	42.8	$\frac{42.8}{12} = 3.56$	1	1
H	7.2	$\frac{7.2}{1} = 7.2$	2	2
N	50	$\frac{50}{14} = 3.57$	1	1

$\therefore$  Empirical formula =  $CH_2N$

Empirical formula mass = 28

Now, number of moles =  $\frac{\text{volume given at STP}}{22400\text{mL}}$

$$= \frac{50}{22400} = 2.23 \times 10^{-3}$$

Also, number of moles =  $\frac{\text{weight}}{\text{molecular weight}}$

$$\Rightarrow \text{Molecular weight} = \frac{1}{2.23 \times 10^{-3}} = 448$$

$$\therefore n = \frac{\text{molecular weight}}{\text{empirical weight}} = \frac{448}{28} = 16$$

Hence, molecular formula = ( empirical formula )<sub>n</sub>

$$= (CH_2N)_{16} = C_{16}H_{32}N_{16}$$

## Question 11

How much  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$  and pure water are to be mixed to prepare 50g of 12.0% (by mass)  $\text{BaCl}_2$  solution?

Options:

- A. 40.4g
- B. 42.9g
- C. 52.7g
- D. 50.0g

Answer: B

Solution:

Solution:

$w = 12\text{g}$  of  $\text{BaCl}_2$ ,  $W = 100\text{g}$  of solution.

For 50g of solution,  $w = 6\text{g}$  of  $\text{BaCl}_2$

$W = 50\text{g}$  of solution

$$\therefore w_{\text{BaCl}_2 \cdot 2\text{H}_2\text{O}} = \left( \frac{6 \times 244}{208} \right) \text{g} = 7.038\text{g}$$

$$w_{\text{H}_2\text{O}} = (50 - 7.038)\text{g} = 42.96\text{g} \sim 42.9\text{g}$$

---

## Question 12

What is enthalpy of formation of  $\text{NH}_3$ , if bond enthalpies as  $(\text{N} \equiv \text{N}) = -941\text{kJ} / \text{mol}$ ,  $(\text{H} - \text{H}) = 436\text{kJ} / \text{mol}$  and  $(\text{N} - \text{H}) = 389\text{kJ} / \text{mol}$  ?

Options:

- A.  $-84.5\text{kJ} / \text{mol}$
- B.  $-63.45\text{kJ} / \text{mol}$
- C.  $-21.25\text{kJ} / \text{mol}$
- D.  $-42.5\text{kJ} / \text{mol}$

Answer: D

Solution:

Solution:

$$\Delta_f H (\text{NH}_3) = \text{Bond energy of reactant} - \text{Bond energy of product}$$

$$\begin{aligned}
 &= \left( \frac{1}{2} \times \text{BE of N} \equiv \text{N bond} + \frac{3}{2} \text{BE of H} - \text{H bond} \right) - (3 \text{ BE of N} - \text{H bond}) \\
 &= \left( \frac{1}{2} \times 941 + \frac{3}{2} \times 436 \right) - (3 \times 389) \\
 &= 470.5 + 654 - 1167 = -42.5 \text{ kJ / mol}
 \end{aligned}$$

---

## Question 13

The enthalpy change that accompanies a reaction in which 1 mole of its standard state is formed from its elements in their standard states

**Options:**

- A. bond enthalpy of reaction
- B. standard enthalpy of formation
- C. standard enthalpy of reaction.
- D. standard enthalpy of combustion

**Answer: B**

**Solution:**

**Solution:**

Standard enthalpy of formation is the change in enthalpy that accompanies the formation of one mole of a compound from its elements, with all substances in their standard states, it is also called as 'standard heat of formation'.

---

## Question 14

What is the SI unit of conductivity?

**Options:**

- A.  $\Omega^{-1}$
- B.  $\Omega^{-1} \text{cm}^2 \text{mol}^{-1}$
- C.  $\text{Sm}^2 \text{mol}^{-1}$
- D.  $\text{Sm}^{-1}$

**Answer: D**

**Solution:**

**Solution:**

$$\text{Conductivity } (\sigma) = \frac{1}{\text{Resistivity } (\rho)}$$

In SI unit,  $\sigma = \frac{1}{\text{ohmm}} = \text{Sm}^{-1}$ .

---

## Question 15

What is rate constant of a first order reaction, if 0.08 mole of reactant reduces to 0.02 mole in 23.03 minute?

Options:

- A.  $1.6021\text{min}^{-1}$
- B.  $0.2303\text{min}^{-1}$
- C.  $0.4031\text{min}^{-1}$
- D.  $0.06020\text{min}^{-1}$

Answer: D

Solution:

Solution:

For first order reaction,

$$t = \frac{2.303}{k} \log \frac{a}{a-x}$$

where, t = time, k = rate constant

a = initial concentration

a - x = remaining concentration

$$\begin{aligned} \Rightarrow k &= \frac{2.303}{23.03} \log \frac{0.08}{0.02} = \frac{1}{10} \log 4 \\ &= \frac{0.6020}{10} = 0.06020\text{min}^{-1} \end{aligned}$$

---

## Question 16

Which of the following statement is not true for a reaction having rate law  $r = k[\text{H}_2][\text{I}_2]$  ?

Options:

- A. Overall order of reaction is 2 .
- B. The reaction is first order in  $\text{H}_2$ .
- C. The reaction is first order in  $\text{I}_2$
- D. Overall order of reaction is 1

Answer: D

## Solution:

### Solution:

Among the given statements, (d) is not correct regarding the rate  $= k[\text{H}_2][\text{I}_2]$  because overall order of the reaction is 2 not 1.

---

## Question 17

At room temperature, polonium crystallises in a primitive cubic unit cell. If  $a = 3.36\text{\AA}$ .

Calculate the theoretical density of polonium. [It's atomic weight is  $209\text{g/mol}$ .]

### Options:

- A.  $9.15\text{g/cm}^3$
- B.  $10.33\text{g/cm}^3$
- C.  $6.22\text{g/cm}^3$
- D.  $9.74\text{g/cm}^3$

**Answer: A**

### Solution:

#### Solution:

Given number of atoms per unit cell,  $Z = 1$

Molecular weight,  $M = 209\text{g/mol}$

Avogadro number,  $N_A = 6.022 \times 10^{23}$

$V = a^3 = (3.36 \times 10^{-8})^3\text{cm}^3$  [ $\because Z = 1$ ]

We know that,

$$d = \frac{ZM}{N_A V} = \frac{1 \times 209}{6.022 \times 10^{23} \times (3.36 \times 10^{-8})^3}$$
$$= 9.15\text{g/cm}^3$$

---

## Question 18

The vapour pressure of 100g of water reduces from 17.53mm to 17.22mm when 17.10g of substance X is dissolved in it. Substance X can be

### Options:

- A. methanol
- B. glucose

C. carbon dioxide

D. cannot predict

**Answer: B**

**Solution:**

**Solution:**

Given  $p^\circ = 17.53$ ,  $p_s = 17.22$  and  $W = 17.10$

$$\frac{p^\circ - p_s}{p^\circ} = \frac{n}{n + N} = \frac{\frac{w}{m}}{\frac{w}{m} + \frac{W}{M}}$$

$$\therefore \frac{w}{m} < \frac{W}{M}$$

$$\therefore \frac{p^\circ - p_s}{p^\circ} = \frac{w/m}{W/M} = \frac{w}{m} \times \frac{M}{W}$$

$$\frac{17.53 - 17.22}{17.53} = \frac{17.10}{m} \times \frac{18}{100}$$

$$\Rightarrow m = \frac{17.10 \times 18 \times 17.53}{0.31 \times 100} = 174.05$$

174 is nearest to the molecular weight of glucose ( $C_6H_{12}O_6$ ), thus the substance X can be glucose.

## Question 19

The process by which sites of adsorbent are made free so, that more adsorbent can occupy them is called

**Options:**

A. sorption

B. desorption

C. unbalanced distribution

D. dissociation

**Answer: B**

**Solution:**

**Solution:**

Desorption is the process of removing an adsorbed substance from the surface of adsorbent, so that more adsorbate can occupy surface of adsorbent.

## Question 20

Starch is an example of which of the following type of colloid?

**Options:**

- A. Macromolecular colloid
- B. Associated colloid
- C. Molecular colloid
- D. Electrolytic solution

**Answer: A****Solution:****Solution:**

Starch is an example of macromolecular colloid. In this type of colloid, the particles are themselves large molecules which on dissolution form size in the colloidal range.

## Question 21

### Hybridisation of $[\text{Ni}(\text{CN})_4]^{2-}$ is

**Options:**

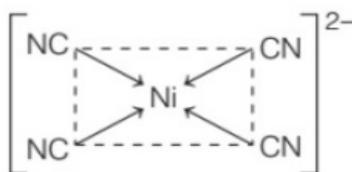

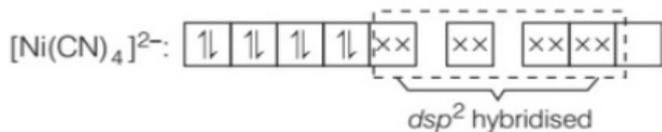

- A.  $d sp^2$
- B.  $sp^3 d^2$
- C.  $d^2 sp^3$
- D.  $sp^3$

**Answer: A****Solution:****Solution:**

Hybridisation of  $[\text{Ni}(\text{CN})_4]^{2-}$  is  $d sp^2$ .

$\text{Ni} = 1s^2, 2s^2, 2p^6, 3s^2 3p^6 3d^8 4s^2$

$\text{Ni}^{2+} = 1s^2, 2s^2, 2p^6, 3s^2 3p^6 3d^8, 4s^0 4p^0$

## Question 22

The IUPAC name of the coordination compound  $[\text{Co}(\text{H}_2\text{O})_2(\text{NH}_3)_4]\text{Cl}_3$  is

**Options:**

- A. tetraamminediaquacobalt (III) chloride
- B. cobalt (III) tetraamminediaquachloride
- C. diaquatetraammine cobalt (III) chloride
- D. tetraammine diaquacobalt (II) chloride

**Answer: A**

**Solution:**

**Solution:**

The IUPAC name of the coordination compound  $[\text{Co}(\text{H}_2\text{O})_2(\text{NH}_3)_4]\text{Cl}_3$  is tetraamminediaquacobalt (III) chloride.

---

## Question 23

The 3d -block elements that exhibits maximum number of oxidation states is

**Options:**

- A. Sc
- B. Ti
- C. Mn
- D. Zn

**Answer: C**

**Solution:**

**Solution:**

Mn exhibits the maximum number of oxidation states.  $\text{Mn}(Z = 25) = [\text{Ar}]3d^54s^2$ . It shows +2, +3, +4, +5, +6 and +7 oxidation states.

---

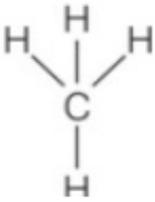

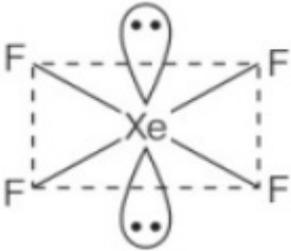

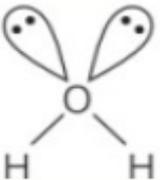

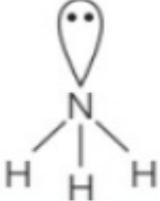

## Question 24

Which one of the following does not have  $sp^3$  hybridisation?

**Options:**

- A.  $\text{CH}_4$
- B.  $\text{XeF}_4$
- C.  $\text{H}_2\text{O}$
- D.  $\text{NH}_3$

**Answer: B****Solution:****Solution:**

Molecular formula	Geometry	Bond and hybridisation
$\text{CH}_4$		4σ bond $sp^3$ hybridisation
$\text{XeF}_4$		4σ bond + 2 lone pairs $sp^3d^2$ hybridisation
$\text{H}_2\text{O}$		2σ bond + 2 lone pairs $sp^3$ hybridisation
$\text{NH}_3$		3σ bond + 1 lone pair $sp^3$ hybridisation

## Question 25

Identify the molecule having dipole moment.

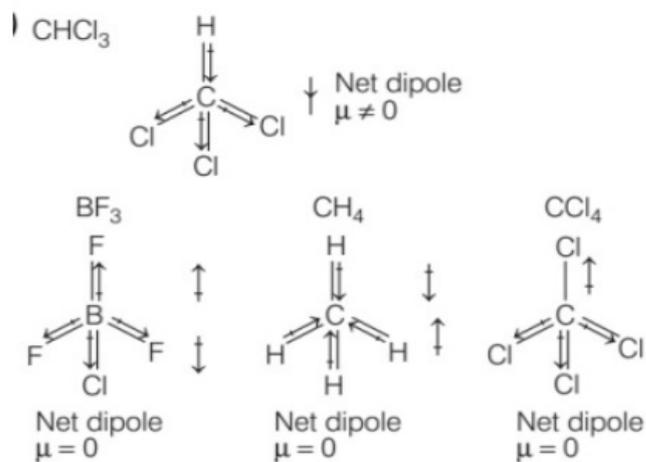

Options:

- A.  $\text{BF}_3$
- B.  $\text{CH}_4$
- C.  $\text{CHCl}_3$
- D.  $\text{CCl}_4$

Answer: C

Solution:

Solution:

Among the given compound  $\text{CHCl}_3$  is having dipole moment.

## Question 26

The major product obtained in the following reaction is  
Chlorobenzene + Chlorine  $\xrightarrow[\text{FeCl}_3]{\text{Anhydrous}}$  product (Major)

Options:

- A. 1,2 -dichlorobenzene
- B. 1, 3, 5-trichlorobenzene
- C. 1 , 4-dichlorobenzene
- D. 1 , 3-dichlorobenzene

Answer: C

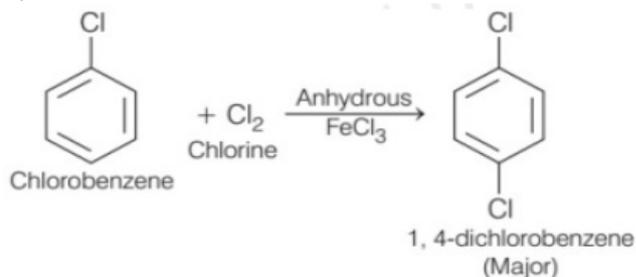

©

## Solution:

### Solution:

1,4 -dichlorobenzene

## Question 27

Which among the following compounds is not a colourless gas?

### Options:

A.  $\text{ClF}_3$

B.  $\text{ClF}$

C.  $\text{IF}_7$

D.  $\text{IF}_3$

**Answer: D**

### Solution:

#### Solution:

$\text{IF}_3$  is a yellow powder whereas  $\text{ClF}_3$ ,  $\text{ClF}$  and  $\text{IF}_7$  is a colourless gas.

## Question 28

${}_6^{14}\text{C}$  and  ${}_8^{16}\text{O}$  are the examples of

### Options:

A. isotopes

B. isobars

C. isoelectronic species

D. isotones

**Answer: D**

**Solution:**

**Solution:**

${}^6_{14}\text{C}$  and  ${}^8_{16}\text{O}$  have same number of neutrons, i.e. 8. Therefore, they are the examples of isotones.

---

## Question 29

**Which of the following series of transition of hydrogen spectrum falls in visible region?**

**Options:**

- A. Lyman series
- B. Balmer series
- C. Paschen series
- D. Brackett series

**Answer: B**

**Solution:**

**Solution:**

Balmer series of transitions in the spectrum of hydrogen atom fall in visible region. Lyman series falls in ultraviolet region, while Paschen and Brackett series fall in infrared region.

---

## Question 30

**Among the following order, which one is correct order of reactivity of group 16 elements?**

**Options:**

- A.  $\text{O} > \text{S} > \text{Se} > \text{Te} > \text{Po}$
- B.  $\text{O} > \text{Se} > \text{Te} > \text{S} > \text{Po}$
- C.  $\text{Po} > \text{Te} > \text{Se} > \text{S} > \text{O}$
- D.  $\text{S} > \text{O} > \text{Se} > \text{Te} > \text{Po}$

**Answer: A**

**Solution:**

**Solution:**

Oxygen is the most reactive among the other elements of group 16. As we move down the group, the reactivity decreases because there is an increase in the atomic radius down the group and hence, the effective nuclear charge decreases which leads to decrease in chemical reactivity. So, the reactivity order will be  $O > S > Se > Te > Po$ .

---

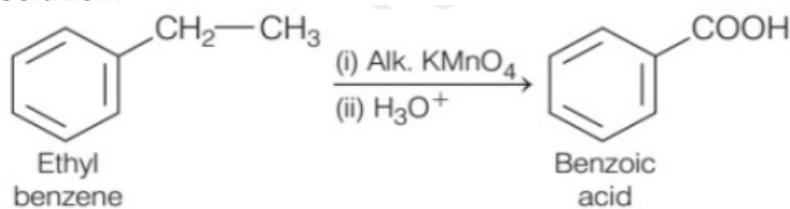

## Question 31

Identify the product formed in following reaction.

**Options:**

- A.  $\text{C}_6\text{H}_5\text{OH}$
- B.  $\text{C}_6\text{H}_5\text{COOH}$
- C.  $\text{C}_6\text{H}_5\text{CH}_2\text{COOH}$
- D.  $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{COOH}$

**Answer: B**

**Solution:****Solution:**

## Question 32

Identify electron withdrawing group from following when attached with  $\pi$ -bond.

**Options:**

- A. - COOH
- B. - OR
- C. - Cl
- D. - OH

**Answer: A**

## Solution:

### Solution:

An electron withdrawing group (EWG) is a group that reduces electron density in a molecule through the carbon atom it is bonded to. Here -COOH is one such example of electron withdrawing group.

## Question 33

Which of the following is incorrectly matched.

### Options:

A. Decreasing order of  $pK_b$  values :

B. Decreasing order of basic strength :

C. Increasing order of basic strength : p-nitroaniline < aniline < p-toluidine

D. Increasing order of solubility in water :  $C_6H_5NH_2 < (C_2H_5)_2NH < C_2H_5NH_2$

Answer: A

### Solution:

#### Solution:

$C_6H_5NH_2$  and  $C_6H_5NHCH_3$  are less basic than  $C_2H_5NH_2$  and  $(C_2H_5)_2NH$  it is due to the delocalisation of lone pair of electrons of N-atom over the benzene ring.

Next,  $C_6H_5NHCH_3$  is little more basic than  $C_6H_5NH_2$  it is due to the +effect of the  $CH_3$  group. Among  $C_2H_5NH_2$  and  $(C_2H_5)_2NH$ ,  $(C_2H_5)_2NH$  is more basic than  $C_2H_5NH_2$  due to greater +I-effect of two  $C_2H_5$  group.

By combining above facts, the relative basic strength of given amines decreases as :

As a stronger base has a lower  $pK_b$  value, therefore,  $pK_b$  values decreases in the reverse order.

## Question 34

Consider the following reactions.

Identify the compound formed C in the above reaction.

### Options:

A. Nitrobenzene

B. Aniline

C. Chloro benzene

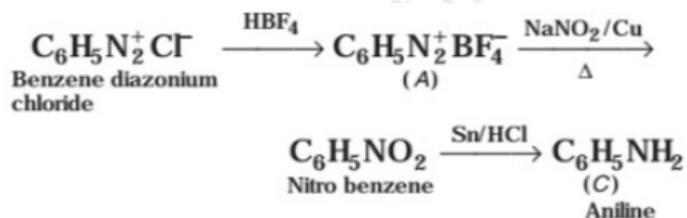

D. Phenol

**Answer: B**

**Solution:**

**Solution:**

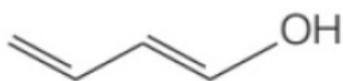

## Question 35

The bond line structure of crotonyl alcohol is

**Options:**

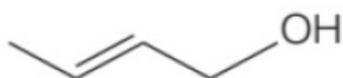

A.

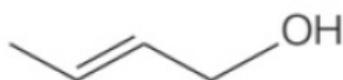

B.

C.

D.

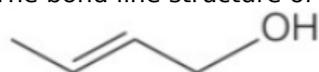

**Answer: C**

**Solution:**

**Solution:**

The bond line structure of crotonyl alcohol is

## Question 36

**Which among the following compounds has highest melting point?**

©

**Options:**

- A. Phenol
- B. p-cresol
- C. p-nitrophenol
- D. O-nitrophenol

**Answer: C**

**Solution:**

**Solution:**

p-nitrophenol has highest melting point due to the presence of intermolecular hydrogen bonding, which is not present in all other given compounds.

---

## Question 37

**Which of the following alkenes on oxidation by  $\text{KMnO}_4$  in dil.  $\text{H}_2\text{SO}_4$  forms adipic acid?**

©

**Options:**

- A. Hex-2-ene
- B. Hex-1-ene
- C. Cyclohexene
- D. Hex-3-ene

**Answer: C**

**Solution:**

**Solution:**

Cyclohexene on oxidation with  $\text{KMnO}_4$  in presence of dil.  $\text{H}_2\text{SO}_4$  will form adipic acid, in which oxidative cleavage takes place. The double bond is broken to which oxygen atoms are going to be added forming a carboxylic acid group at each. Thus, the cyclic structure is broken forming adipic acid.

---

## Question 38

**Which of the following species is amphoteric in nature?**

©

**Options:**

- A. HCl
- B. H<sub>2</sub>O
- C. CH<sub>3</sub>COOH
- D. NaOH

**Answer: B****Solution:****Solution:**

Water is amphoteric in nature i.e. it can act as an acid as well as a base. It acts as an acid with NH<sub>3</sub> and a base with H<sub>2</sub>S.

The auto protolysis (self ionisation) of water takes place as follows

acid                  base

---

## Question 39

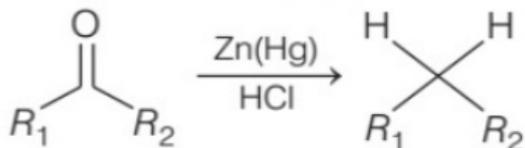

**Identify the reaction in which carbonyl group of aldehydes and ketones is reduced to methylene group on treatment with zinc-amalgam and conc. HCl.**

**Options:**

- A. Wolf-Kishner reduction
- B. Clemmensen reduction
- C. Stephen reduction
- D. Etard reaction

**Answer: B****Solution:****Solution:**

The reduction of carbonyl groups (in aldehydes and ketones) to methylene groups with zinc amalgam and hydrochloric acid is known as the Clemmensen reduction reaction.

---

## Question 40

Which of the following is an example of green chemistry?

Options:

- A. Recycled carpet
- B. A product made on Earth's day
- C. A sublimation reaction
- D. Bio-plastics or bio-diesel

Answer: D

Solution:

Solution:

Bio-plastics or bio-diesel is a product of green chemistry so, other options (a, b, c) are incorrect.

---

## Question 41

Which of the following alkyl halide is treated with sodium metal to obtain 2, 2, 3, 3-tetramethyl butane?

Options:

- A. sec-butyl bromide
- B. n-propyl bromide
- C. n-butyl bromide
- D. tert-butyl bromide

Answer: D

Solution:

Solution:

In the Wurtz reaction, alkyl halides react with sodium in dry ether to give hydrocarbon contain double the number of carbon atoms present in the halide.

---

## Question 42

Consider the following sequence of reactions

Identify D.

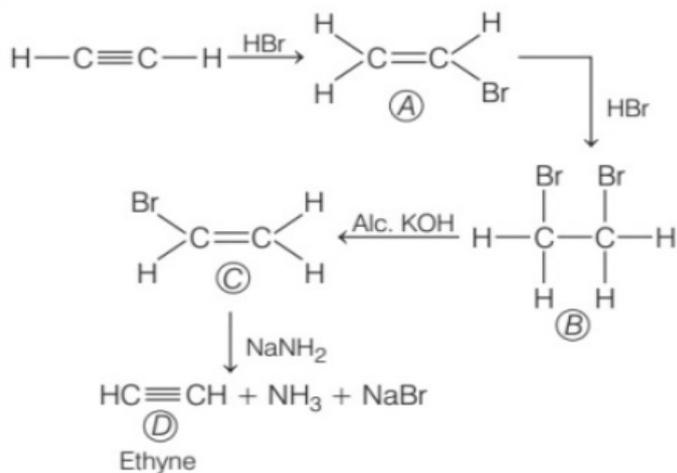

**Options:**

- A. Ethanol
- B. Ethane
- C. Ethyne
- D. Ethanal

**Answer: C**

**Solution:**

**Solution:**

## Question 43

Identify the polymer used in making floor tiles.

**Options:**

- A. PVC
- B. LDPE
- C. HDPE
- D. PETE

**Answer: A**

**Solution:**

**Solution:**

Polyvinyl chloride or PVC is used in making floor tiles. Flexible PVC is made flexible and strong to prepare floor tiles. So, the correct option is (a).

## Question 44

Which of the following is a thermosetting polymer?

Options:

- A. Polythene
- B. Bakelite
- C. Polystyrene
- D. Polyvinyls

Answer: B

Solution:

**Solution:**

Bakelite is thermosetting polymer as it contains cross links, or heavily branched polymer chains. It gets hardened on heating and cannot be softened again.

---

## Question 45

A sample of air turns lime water milky and also turns acidified potassium dichromate green in aqueous solution has low pH . This is due to the presence of pollutants.

Options:

- A. CO<sub>2</sub>
- B. SO<sub>2</sub>
- C. Both (a) and (b)
- D. None of these

Answer: B

Solution:

**Solution:**

SO<sub>2</sub> turns lime water milky.

SO<sub>2</sub> in aqueous solution gives H<sub>2</sub>SO<sub>3</sub>.

CO<sub>2</sub> also turns lime water milky.

CO<sub>2</sub> in aqueous solution gives H<sub>2</sub>CO<sub>3</sub>.

H<sub>2</sub>SO<sub>3</sub> is stronger acid than H<sub>2</sub>CO<sub>3</sub>. Thus, ionisation of H<sub>2</sub>SO<sub>3</sub> is larger than H<sub>2</sub>CO<sub>3</sub>. Thus, pH of H<sub>2</sub>SO<sub>3</sub> is lower than that of H<sub>2</sub>CO<sub>3</sub>.

## Question 46

Solubility product of AgBr is  $4.9 \times 10^{-13}$ . What is its solubility?

Options:

- A.  $2.4 \times 10^{-7} \text{ mol d m}^{-3}$
- B.  $7.0 \times 10^{-7} \text{ mol d m}^{-3}$
- C.  $4.9 \times 10^{-7} \text{ mol d m}^{-3}$
- D.  $3.2 \times 10^{-7} \text{ mol d m}^{-3}$

Answer: C

Solution:

Solution:

The equilibrium reaction of AgBr is

$$\begin{aligned} \text{Molar solubility (S) of AgBr} &= \sqrt{4.9 \times 10^{-13}} \\ &= 7.0 \times 10^{-7} \text{ mol d m}^{-3} \end{aligned}$$

## Question 47

Consider the following reaction

Here, 'A' and 'B' are respectively

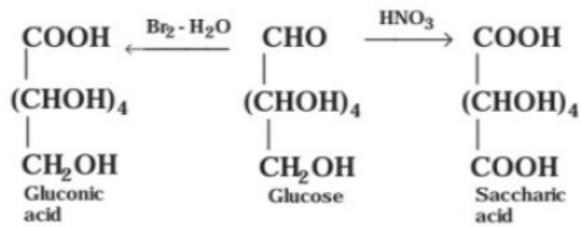

Options:

- A. glucose oxime and saccharic acid
- B. gluconic acid and saccharic acid
- C. saccharic acid and sorbitol
- D. gluconic acid and sorbitol

Answer: B

Solution:

Solution:

## Question 48

Which of the following has maximum solubility?

Options:

- A.  $\text{BeF}_2$
- B.  $\text{MgF}_2$
- C.  $\text{CaF}_2$
- D.  $\text{SrF}_2$

Answer: A

Solution:

**Solution:**

The solubility of fluorides of alkaline earth metals decreases down the group due to increase in hydration enthalpy. Thus, the order of solubility of the given compounds is  $\text{BeF}_2 > \text{MgF}_2 > \text{SrF}_2$ . Hence,  $\text{BeF}_2$  has maximum solubility.

## Question 49

Which of the following explanation is correct about the given below reaction?

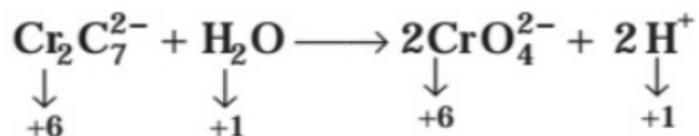

Options:

- A. Cr is reduced
- B. Cr is oxidised
- C. Oxidation number of Cr has neither decreased nor increased
- D. Hydrogen is reduced

Answer: C

## Solution:

### Solution:

The oxidation number of Cr in  $\text{Cr}_2\text{O}_7^{2-}$  and  $\text{CrO}_4^{2-}$  is same, i.e. 6. Thus, oxidation of Cr has neither decreased nor increased.

## Question 50

**Aldehydes are readily oxidised to yield carboxylic acids but ketones are inert to oxidation. Which is the most likely explanation regarding this difference in reactivity?**

### Options:

- A. Aldehydes have a proton attached to the carbonyl that is abstracted during oxidation. Ketones lack this proton and so, cannot oxidised.
- B. Reducing agents like  $\text{HNO}_3$  are sterically hindered by ketone's carbonyl carbon.
- C. Aldehydes and ketones are of similar hybridisation.
- D. The rate of the forward oxidation reaction is equal to the rate of the reverse reduction reaction in ketones.

**Answer: A**

### Solution:

#### Solution:

Abstraction of H-atom, attached to carbonyl group in an aldehyde, is much easier than the abstraction from bulkier alkyl group attached to carbonyl group in a ketone.

## Question 51

**If an alkane contain n number of carbon atoms, the number of oxygen molecules required for combustion of alkane are**

### Options:

- A.  $\frac{3n + 1}{2}$
- B.  $\frac{2n + 1}{2}$

C.  $2n + 1$

D.  $n$

**Answer: A**

**Solution:**

**Solution:**

The chemical reaction of complete combustion of alkane is as follows :

where  $n$  = number of carbon atoms.

---

## Question 52

Which among the following is branched polymer?

**Options:**

A. Bakelite

B. HDP

C. PVC

D. LDP

**Answer: D**

**Solution:**

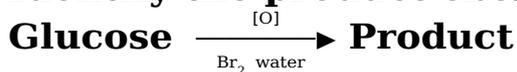

**Solution:**

LDP i.e. low density polythene has highly branched structure. It is mainly used for manufacturing containers, wash bottles, plastic bags etc.

---

## Question 53

Identify the product obtained in the following conversion.

**Options:**

A. n-hexane

B. Gluconic acid

C. Saccharic acid

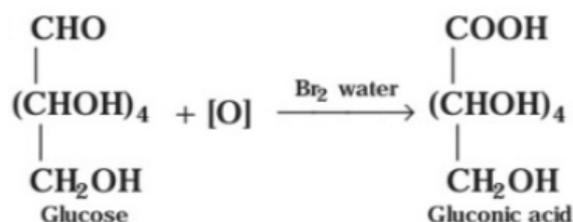

D. Glucose cyanohydrine

**Answer: B**

**Solution:**

**Solution:**

## Question 54

Arrange the following free radicals in order of decreasing stability. Methyl (I), Vinyl (II), Allyl (III), Benzyl (IV) Codes

**Options:**

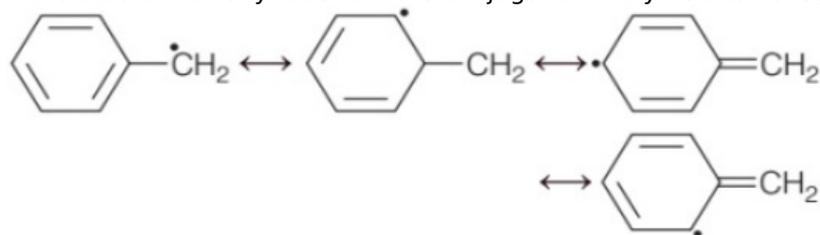

- A. I > II > III > IV
- B. III > II > I > IV
- C. II > I > IV > III
- D. IV > III > I > II

**Answer: D**

**Solution:**

**Solution:**

Among the alkyl free radicals, tertiary alkyl free radicals are most stable and methyl free radical is least stable. Benzyl and allyl free radicals are resonance stabilised and are more stable than alkyl free radicals. Benzyl free radical is more stable than allyl due to more conjugation. Vinyl radical is least stable as the odd electron is present on  $sp^3$ C-atom.

$\therefore$  Benzyl > Allyl > Methyl > Vinyl

## Question 55

The decreasing order of the rate of nitration of benzene (I),  $\text{C}_6\text{D}_6$  (II), nitrobenzene (III), chlorobenzene (IV) is

**Options:**

©

- A. I > II > III > IV
- B. I > I > IV > II
- C. I = I > IV > III
- D. I = II > III > IV

**Answer: C**

**Solution:**

**Solution:**

Rate of nitration is faster when substituent activates the ring (+I-effect or +R-effect, ortho/para directing) and rate is slower when substituent deactivates the ring (-I-effect or -R-effect, meta directing group).

- Halogen deactivates ring but orientation is ortho para directing group.

- Rate of  $C_6H_6 = C_6D_6$ , as no effect is observed when H is replaced by D. Hence, order is

I = II > IV > III

## Question 56

The chemical test that distinguish between benzoic acid and phenol is

**Options:**

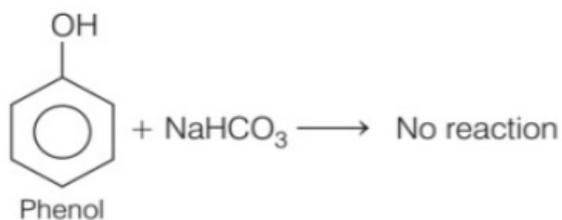

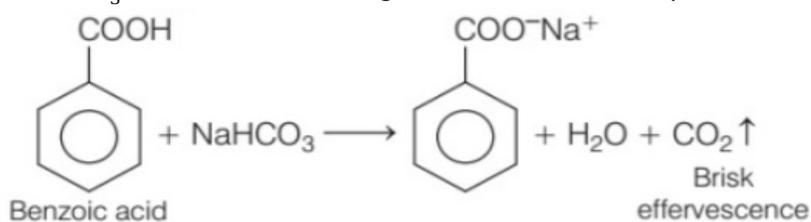

- A.  $NaHCO_3$  test
- B. Tollen's reagent
- C. Biuret test
- D. None of these

**Answer: A**

**Solution:**

**Solution:**

$NaHCO_3$  test is used to distinguish benzoic acid and phenol.

## Question 57

## The order of reactivity of hydrogen halides with ether is as follows

©

### Options:

- A.  $\text{H Br} > \text{H I} > \text{H Cl}$
- B.  $\text{H Cl} > \text{H Br} > \text{H I}$
- C.  $\text{H I} > \text{H Br} > \text{H Cl}$
- D.  $\text{H Cl} > \text{H I} > \text{H Br}$

**Answer: C**

### Solution:

#### Solution:

The correct order of hydrogen halides is  $\text{HI} > \text{H Br} > \text{H Cl}$ . The cleavage of ethers usually takes place with conc. HI or HBr at high temperature.

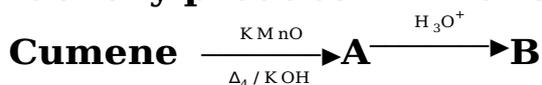

Greater the nucleophilicity of halide ion, more is the reactivity of hydrogen halide.

---

## Question 58

Identify product B in following reaction.

©

### Options:

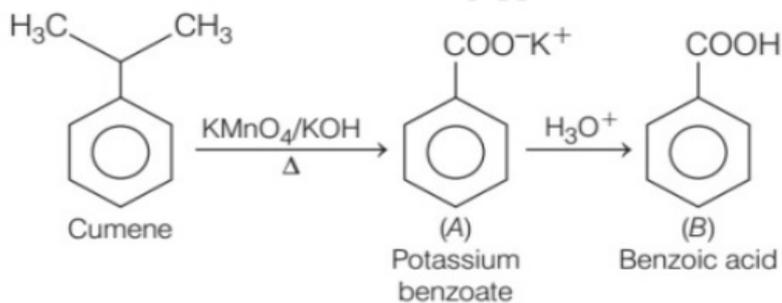

- A. Phenol
- B. Benzophenone
- C. Benzaldehyde
- D. Benzoic acid

**Answer: D**

### Solution:

#### Solution:

## Question 59

The most effective pair of reagents for the preparation of tert-butyl ether is

Options:

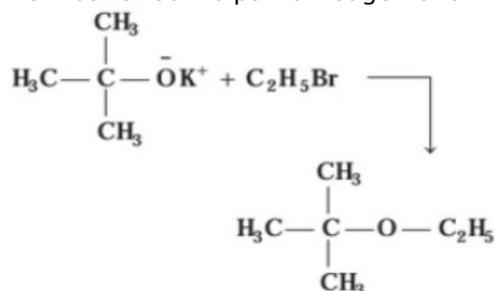

- A. tert-butyl alcohol and ethyl bromide
- B. sodium ethoxide and tert-butyl bromide
- C. potassium tert-butoxide and ethanol
- D. potassium tert-butoxide and ethyl bromide

Answer: D

Solution:

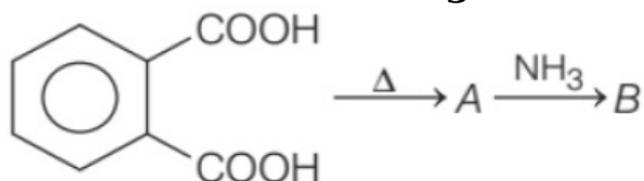

Solution:

The most effective pair of reagents for the preparation of tert-butyl ether is potassium tert-butoxide and ethyl bromide.

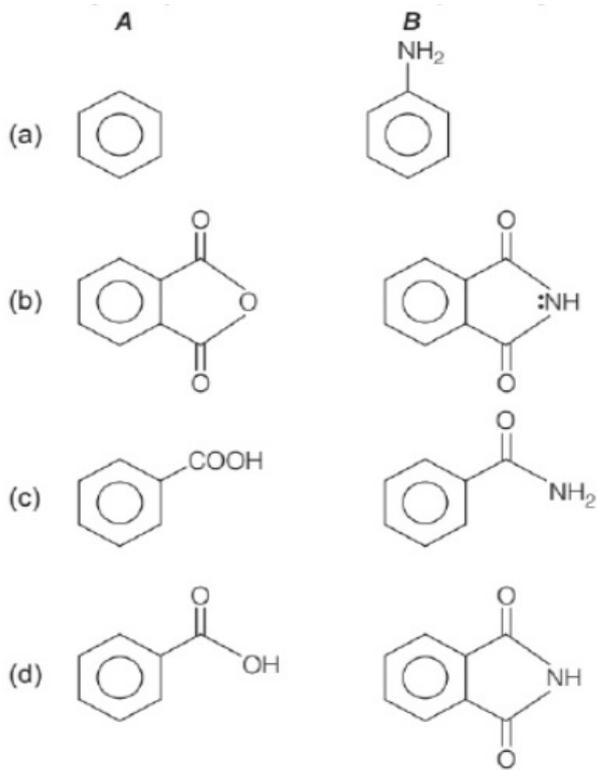

## Question 60

Consider the following reaction

Identify the products A and B respectively.

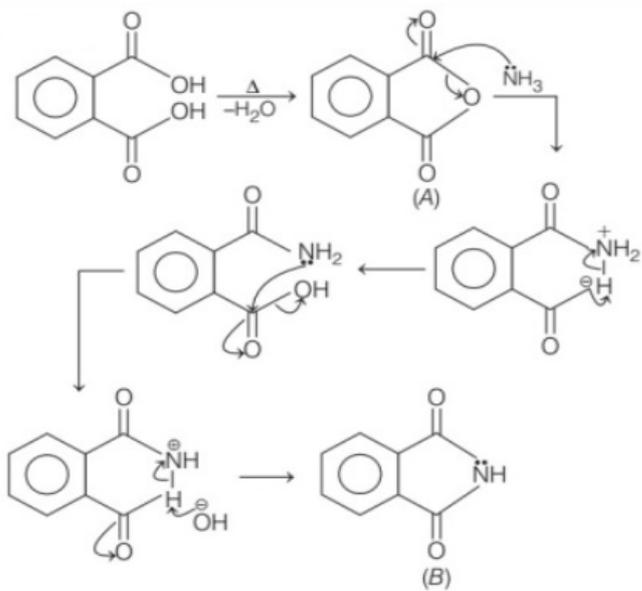

**Options:**

- A. (a)
- B. (b)
- C. (c)
- D. (d)

**Answer: B**

**Solution:**

**Solution:**

## Question 61

The major product obtained in the following reaction is

Options:

- A. 4-iodo-3-methylhexane
- B. 4-iodo-4-methylhexane
- C. 3-iodo-3-methylhexane
- D. 3-iodo-4-methylhexane

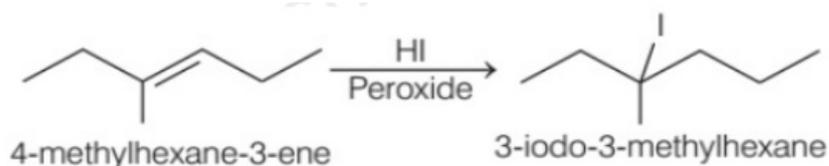

Answer: C

Solution:

Solution:

3-iodo-3-methylhexane

Here, a molecule HI is added to C = C double bond. The addition follows anti-Markownikoff's rule.

## Question 62

Which of the following is likely to undergo racemisation during alkaline hydrolysis?

Options:

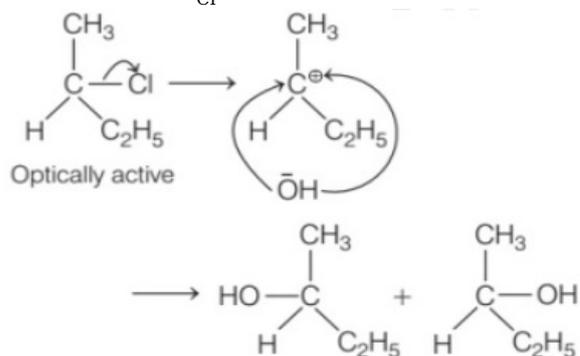

- A.  $(\text{CH}_3)_3\text{C} - \text{CH}_2 - \text{Cl}$
- B.  $\text{H}_3\text{C} - \underset{\text{Cl}}{\text{CH}} - \text{CH}_3$
- C.  $\text{H}_3\text{C} - \text{CH}_2 - \underset{\text{Cl}}{\text{CH}} - \text{CH}_3$
- D.  $\text{H}_3\text{C} - \text{CH}_2 - \underset{\text{Cl}}{\text{CH}} - \text{CH}_2 - \text{CH}_3$

Answer: C

Solution:

Solution:

Among the given compounds,  $\text{H}_3\text{C}-\text{CH}_2-\underset{\text{Cl}}{\text{CH}}-\text{CH}_3$  will undergo racemisation during alkaline hydrolysis. The reaction involved is as follows:

## Question 63

The 'green' chemical used in household cleaners to remove stains and also a favourite dressing on salads is

**Options:**

- A. vinegar
- B. citric acid
- C. hydrochloric acid
- D. water

**Answer: A**

**Solution:**

**Solution:**

Vinegar (acetic acid) is used as household cleaner to remove stains and is also a favourite dressing on salads.

## Question 64

The two half-cell reactions of an electrochemical cell is given as

The value of EMF will be

**Options:**

- A.  $-0.3125\text{V}$
- B.  $0.3125\text{V}$

C. 1.114V

D. -1.114V

**Answer: B**

**Solution:**

**Solution:**

Species with more negative  $E^\circ$  (standard reduction potential) generally acts as reducing agent, while with less negative value,  $E^\circ$  act as oxidising agent. Thus, the overall reaction is

The value of EMF will be,

$$\begin{aligned}\Delta E^\circ &= E_{\text{oxidation}}^\circ - E_{\text{reduction}}^\circ \\ &= -0.3995 - (-0.7120) \\ &= +0.3125\text{V}\end{aligned}$$

---

## Question 65

**Ethers when dissolved in cold concentrated sulphuric acid forms**

**Options:**

A. oxonium salts

B. alkanolic acids

C. alkanols

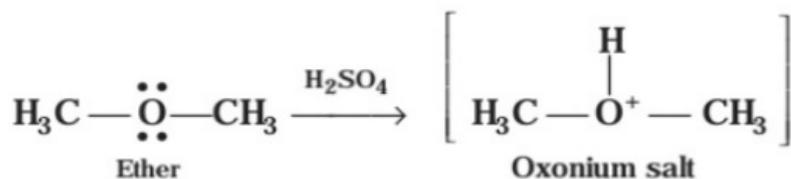

D. alkyl hydrogen sulphate

**Answer: A**

**Solution:**

**Solution:**

Ethers react with cold concentrated sulphuric acid to form oxonium salts. In ethers due to the presence of lone pairs of electrons on oxygen atoms, it behaves as a Lewis base and reacts with a strong acid to form protonated oxonium salt.

---

## Question 66

**The value of Rydberg constant in joule is**

**Options:**

A. 0.082

©

B.  $2.18 \times 10^{-18}$

C.  $2.0 \times 10^{-19}$

D. 8.314

**Answer: B**

**Solution:**

**Solution:**

The value of Rydberg constant is  $2.18 \times 10^{-18} \text{J}$ .

---

## Question 67

**What is the number of lone pair of electrons in  $\text{IF}_7$  ?**

**Options:**

A. 1

B. 2

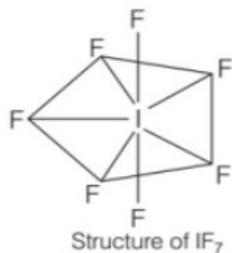

C. 3

D. 0

**Answer: D**

**Solution:**

**Solution:**

Number of lone pair of electron in  $\text{IF}_7$  is 0 .

---

## Question 68

**The  $\text{H} - \text{N} - \text{H}$  bond angle in ammonia molecule is**

**Options:**

A.  $107^\circ$

- B.  $111^\circ$
- C.  $104^\circ$
- D.  $109^\circ$

**Answer: A**

**Solution:**

**Solution:**

The  $\text{H} - \text{N} - \text{H}$  bond angle in ammonia molecule is  $107^\circ$ . Since, the repulsion between lone pair- lone pair and lone pair-bond pair is more than that between bond pair-bond pair. The repulsion in  $\text{H}_2\text{O}$  is much greater than that in  $\text{NH}_3$  which results in contraction of bond angle from  $109^\circ 28'$  to  $104.5^\circ$  in water while in  $\text{NH}_3$  contraction i.e. less is from  $109^\circ 28'$  to  $107^\circ$ .

## Question 69

**Identify compound having square pyramidal shape from following**

**Options:**

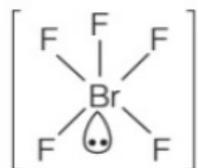

- A.  $\text{ClF}_5$
- B.  $\text{BrF}_5$
- C.  $\text{ICl}$
- D.  $\text{BrF}_3$

**Answer: B**

**Solution:**

**Solution:**

According to VSEPR theory, the shape of  $\text{BrF}_5$  is square pyramidal and its electron geometry is octahedral because bromine being the central atom has five bonds connected with surrounding fluorine atoms. Each  $\text{F} - \text{Br} - \text{F}$  bond making an angle of  $90^\circ$  in the same plane.

Square pyramidal structure of  $\text{BrF}_5$

## Question 70

**The IUPAC name of complex ion  $[\text{Cr}(\text{NH}_3)_4\text{Cl}_2]^+$  is**

©

**Options:**

- A. tetraaminedichloridochromium (III) ion
- B. dichloridotetraaminechromium (III) ion
- C. dichloridotetraaminechromate (II) ion
- D. tetraaminedichloridochromate (III) ion

**Answer: A****Solution:****Solution:**

The IUPAC name of the complex ion  $[\text{Cr}(\text{NH}_3)_4\text{Cl}_2]^+$  is tetraaminedichloridochromium (III) ion.

## Question 71

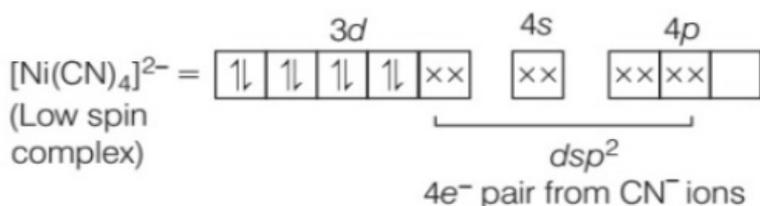

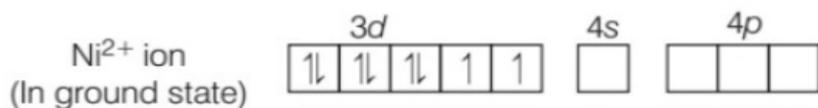

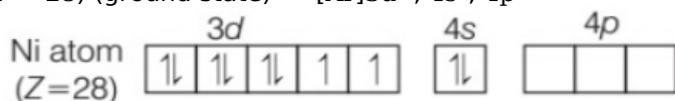

**Which of the following statement is incorrect?****Options:**

- A.  $[\text{NiCl}_4]^{2-}$  is paramagnetic.
- B.  $[\text{Ni}(\text{CO})_4]$  is diamagnetic.
- C.  $[\text{Cr}(\text{NH}_3)_6]^{3+}$  is paramagnetic.
- D.  $[\text{Ni}(\text{CN})_4]^{2-}$  is paramagnetic.

**Answer: D****Solution:****Solution:**

$[\text{Ni}(\text{CN})_4]^{2-}$  is diamagnetic not paramagnetic.

Ni atom ( $Z = 28$ ) (ground state) =  $[\text{Ar}]3d^8, 4s^2, 4p^0$

$\text{CN}^-$  is a strong field ligand, due to which pairing of electron takes place.

## Question 72

Which of the following statement is incorrect?

Options:

- A.  $[\text{NiCl}_4]^{2-}$  is paramagnetic.
- B.  $[\text{Ni}(\text{CO})_4]$  is diamagnetic.
- C.  $[\text{Cr}(\text{NH}_3)_6]^{3+}$  is paramagnetic.
- D.  $[\text{Ni}(\text{CN})_4]^{2-}$  is paramagnetic.

Answer: D

Solution:

Solution:

In lanthanide series as atomic number increases, atomic radius decreases. Therefore, Pr having lowest atomic number among the given element is having largest atomic radius.

---

## Question 73

Which element from following has largest atomic radius?

Options:

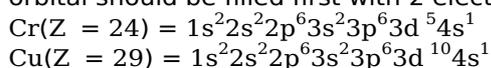

- A. Pm
- B. Eu
- C. Gd
- D. Pr

Answer: A

Solution:

Solution:

The 3d -orbitals of Cr and Cu have half-filled and completely filled electronic configuration respectively which are the most stable electronic configurations. Thus, these both elements do not follow Aufbau principle according to which 4s orbital should be filled first with 2 electrons as it have lower energy than 3d -orbital. So, their electronic configuration are

## Question 74

**Identify positively charged sol from following.**

©

**Options:**

- A. Sols of starch
- B. Congo red sol
- C. Methylene blue sol
- D. Gelatin sol

**Answer: C**

**Solution:**

**Solution:**

Sols of starch, congo red sol and gelatin sol are the examples of negatively charged sol, while methylene blue sol is positively charged sol.

---

## Question 75

**Which one of the following laws will represent the pairing of electrons in a subshell after each orbital is filled with one electron?**

©

**Options:**

- A. Pauli's exclusion principle
- B. Hund's rule
- C. Heisenberg's uncertainty principle
- D. Hess's law

**Answer: B**

**Solution:**

**Solution:**

Hund's rule represent the pairing of electrons in a subshell after each orbital is filled with one electron. Thus, this rule states that "during filling of electrons in a subshell, pairing of electrons cannot take place until there is no empty orbital available". This rule is also called Hund's rule of maximum multiplicity.

---

## Question 76

**What is the energy of an electron in stationary state corresponding to  $n = 2$  ?**

©

**Options:**

- A.  $-3.45 \times 10^{-18}\text{J}$   
 B.  $-0.545 \times 10^{-18}\text{J}$   
 C.  $0.545 \times 10^{-18}\text{J}$   
 D.  $3.45 \times 10^{-18}\text{J}$

**Answer: B****Solution:****Solution:**

Energy of an electron is given by

$$E_n = \frac{-13.6}{n^2} \text{eV}$$

For  $n = 2$ 

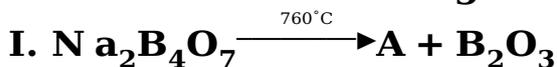

$$E = \frac{-13.6}{2 \times 2} \text{eV} = \frac{-13.6}{4} \text{eV}$$

$$[1 \text{eV} = 1.602 \times 10^{-19} \text{J}]$$

$$= -3.4 \times 1.602 \times 10^{-19} \text{J}$$

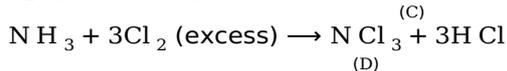

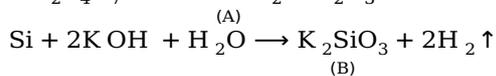

$$= -5.45 \times 10^{-19} \text{J}$$

$$\text{or } = -0.545 \times 10^{-18} \text{J}.$$

**Question 77****Consider the following reactions.****Identify the missing products (A, B, C and D) of the given reactions.****Options:**

- A. (A)  $\rightarrow \text{N a}_2\text{O}$  (B)  $\rightarrow \text{K SiO}_3$  (C)  $\rightarrow \text{N}_2\text{O}_4$  (D)  $\rightarrow \text{N Cl}_3$   
 B. (A)  $\rightarrow \text{N aBO}_2$  (B)  $\rightarrow \text{K}_2\text{SiO}_3$  (C)  $\rightarrow \text{N}_2\text{O}_5$  (D)  $\rightarrow \text{N Cl}_3$   
 C. (A)  $\rightarrow \text{N aBO}_2$  (B)  $\rightarrow \text{K}_2\text{SiO}_3$  (C)  $\rightarrow \text{N}_2\text{O}_4$  (D)  $\rightarrow \overset{\oplus}{\text{N}}\text{Cl}_4$   
 D. (A)  $\rightarrow \text{N a}_2\text{O}$  (B)  $\rightarrow \text{K}_2\text{SiO}_3$  (C)  $\rightarrow \text{N}_2\text{O}_5$  (D)  $\rightarrow \text{N Cl}_3$

**Answer: B****Solution:****Solution:**

---

## Question 78

A buffer solution is prepared in which the concentration of  $\text{NH}_3$  is **0.30M** and the concentration of  $\text{NH}_4^+$  is **0.20M**. If the equilibrium constant,  $K_b$  for  $\text{NH}_3$  equals  $1.8 \times 10^{-5}$ , what is the pH of the solution?

**Options:**

- A. 8.73
- B. 9.08
- C. 9.44
- D. 11.72

**Answer: C**

**Solution:**

**Solution:**

Given,  $K_b = 1.8 \times 10^{-5}$

$$\text{p}K_b = -\log K_b$$

$$= -\log 1.8 \times 10^{-5} = 4.74$$

$$\text{pOH} = \text{p}K_b + \log \frac{[\text{salt}]}{[\text{base}]}$$

$$= 4.74 + \log \frac{0.20}{0.30}$$

$$= 4.74 - 0.176 = 4.56$$

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} = 14 - 4.56 = 9.44$$

---

## Question 79

A synthetic polymer which is an ester is

**Options:**

- A. dacron
- B. teflon
- C. PMMA
- D. PVC

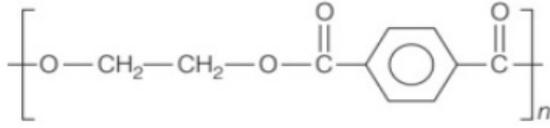

**Answer: A**

**Solution:**

**Solution:**

Among the given polymers, only dacron is the ester. It's structure is as follows :

## Question 80

**Identify the correct decreasing order of precipitation power of flocculating ion added, from following.**

**Options:**

- A.  $\text{Na}^+ > \text{Ba}^{2+} > \text{Al}^{3+}$
- B.  $\text{Al}^{3+} > \text{Ba}^{2+} > \text{Na}^+$
- C.  $\text{Al}^{3+} > \text{Na}^+ > \text{Ba}^{2+}$
- D.  $\text{Ba}^{2+} > \text{Al}^{3+} > \text{Na}^+$

**Answer: B**

**Solution:**

**Solution:**

The flocculation power of cation decreases with decrease in the valence of cation. So, the correct order is  $\text{Al}^{3+} > \text{Ba}^{2+} > \text{Na}^+$

## Question 81

**When electrons are trapped into the crystal in anion vacancy, the defect is known as**

**Options:**

- A. Schottky defect
- B. Frenkel defect
- C. stoichiometric defect
- D. F-centres

**Answer: D**

**Solution:**

**Solution:**

Due to missing of a negative ion from its lattice site, leaving a hole which is occupied by an electron. The electron, thus trapped in anion vacancy is called F-centres.

---

## Question 82

**Gas equation,  $pV = nRT$  is obeyed by a gas in**

**Options:**

- A. adiabatic process
- B. isothermal process
- C. Both (a) and (b)
- D. None of these

**Answer: C**

**Solution:**

**Solution:**

Ideal gas equation,

$$pV = nRT$$

is obeyed by an ideal gas in both adiabatic and isothermal processes.

---

## Question 83

**What will be the formula of an oxide of iodine (atomic mass = 127 ) which contains 25.4g of iodine and 8g of oxygen?**

**Options:**

- A.  $I_2O$
- B.  $I_2O_3$
- C.  $I_2O_5$
- D.  $I_2O_7$

**Answer: C**

**Solution:**

**Solution:**

$\therefore 25.4 \text{ g of } I_2 \text{ combines with } 8 \text{ g of oxygen.}$

$\therefore 254 \text{ g of } I_2 \text{ will combine with } 80 \text{ g of oxygen.}$

Element	Mass%	Atomic mass	Moles of element	Molar ratio	Simplest whole number ratio
I	25.4	127	$\frac{25.4}{127} = 0.2$	$\frac{0.2}{0.2} = 1$	2
O	8	16	$\frac{8}{16} = 0.5$	$\frac{0.5}{0.2} = 2.5$	5

$\therefore$  Formula of oxide of iodine will be  $I_2O_5$ .

## Question 84

**When 0.5g of sulphur is burnt to form  $SO_2$  and 4.6kJ of heat liberated. Calculate enthalpy of formation of  $SO_2(g)$ .**

**(Atomic mass: S = 32, O = 16 )**

**Options:**

A.  $-294.4 \text{ kJ mol}^{-1}$

B.  $-172.4 \text{ kJ mol}^{-1}$

C.  $-81.2 \text{ kJ mol}^{-1}$

D.  $-258.6 \text{ kJ mol}^{-1}$

**Answer: A**

**Solution:****Solution:**

0.5g of sulphur on burning produce 1g of  $SO_2$ .

$\therefore 32 \text{ g of sulphur on burning will produce } 64 \text{ g of } SO_2.$

$$\therefore \Delta H_f = (-4.6 \text{ kJ}) \times 64$$

$$= -294.4 \text{ kJ mol}^{-1}$$

## Question 85

**What is the coordination number of atoms in bcc crystal lattice?**

**Options:**

A. 2

B. 8

C. 6

D. 4

**Answer: B**

**Solution:**

**Solution:**

The body centered cubic lattice has a coordination number of 8 and contains 2 atoms per unit cell.

---

## Question 86

**Which of the following scientific notation of some figures is not correct?**

**Options:**

A.  $2080 = 2.08 \times 10^3$

B.  $0.0034 = 3.4 \times 10^3$

C.  $5000 = 5.0 \times 10^3$

D.  $8008 = 8.008 \times 10^3$

**Answer: B**

**Solution:**

**Solution:**

The correct scientific notation of 0.0034 will be  $3.4 \times 10^{-3}$ . Thus,  $0.0034 = 3.4 \times 10^3$  is incorrect.

---

## Question 87

**What is the difference between  $\Delta H$  and  $\Delta U$  at 298K for the following reaction?**

$$\Delta H = -1410.0\text{kJ}$$

**Options:**

A.  $-14.8\text{kJ}$

B.  $-2.45\text{kJ}$

C.  $-4.95\text{kJ}$

D.  $-7.30\text{kJ}$

**Answer: C**

**Solution:**

**Solution:**

In the given reaction,

$$\Delta H = -1410.0\text{kJ}$$

For ideal gas,  $\Delta H = \Delta U + RT(\Delta n_g)$

where,  $R = 8.314\text{J / mol K}$

$$T = 298\text{K}$$

$\Delta n_g =$  number of gaseous products - number of gaseous reactants

$$= 2 - 4 = -2$$

$$\therefore -1410 = \Delta U + [8.314 \times 298(-2)]$$

$$\Delta U = -1405.045\text{kJ}$$

$$\sim \text{eq } -1405.05\text{kJ}$$

$$\text{Now, } \Delta H - \Delta U = -1410 - (-1405.05) = -4.95\text{kJ}$$

---

## Question 88

What is the relation between  $\frac{d[\text{H}_2]}{dt}$  and  $\frac{d[\text{NH}_3]}{dt}$ ?

**Options:**

A.  $\frac{1}{2} \frac{d[\text{NH}_3]}{dt} = \frac{d[\text{H}_2]}{dt}$

B.  $\frac{d[\text{NH}_3]}{dt} = -\frac{2}{3} \frac{d[\text{H}_2]}{dt}$

C.  $\frac{2}{3} \frac{d[\text{NH}_3]}{dt} = \frac{d[\text{H}_2]}{dt}$

D.  $\frac{d[\text{NH}_3]}{dt} = \frac{d[\text{H}_2]}{dt}$

**Answer: B**

**Solution:**

**Solution:**

Rate expression can be written as,

$$\frac{-d[\text{N}_2]}{dt} = \frac{-1}{3} \frac{d[\text{H}_2]}{dt} = \frac{1}{2} \frac{d[\text{NH}_3]}{dt}$$

$$-\frac{1}{3} \frac{d[\text{H}_2]}{dt} = \frac{1}{2} \frac{d[\text{NH}_3]}{dt}$$

$$\therefore \frac{d[\text{NH}_3]}{dt} = -\frac{2}{3} \frac{d[\text{H}_2]}{dt}$$

---

## Question 89

**The half-life of first order reaction is 1.7hr. What is its rate constant?**

**Options:**

- A.  $0.245\text{hr}^{-1}$
- B.  $1.07\text{hr}^{-1}$
- C.  $0.407\text{hr}^{-1}$
- D.  $3.45\text{hr}^{-1}$

**Answer: C**

**Solution:**

**Solution:**

For first order reaction.

$$k = \frac{0.693}{t_{1/2}} = \frac{0.693}{1.7}\text{hr}^{-1}$$

$$k = 0.407\text{hr}^{-1}$$

---

## Question 90

**Galvanic cell is a device in which**

**Options:**

- A. chemical energy is converted into electrical energy
- B. electrical energy is converted into chemical energy
- C. chemical energy is seen in the form of heat
- D. thermal energy from an outside source is used to derive the cell reaction

**Answer: A**

**Solution:**

**Solution:**

Galvanic cell is an electrochemical cell that converts the chemical energy of a spontaneous reaction into electrical energy.

---

## Question 91

**The solubility product ( $K_{sp}$ ) of solid barium sulphate at 298K is  $1.1 \times 10^{-10}$ . The molar solubility, S of  $[\text{Ba}^{2+}]$  and  $[\text{SO}_4^{2-}]$  is**

**Options:**

- A.  $1.05 \times 10^{-7} \text{ mol L}^{-1}$   
 B.  $1.05 \times 10^{-10} \text{ mol L}^{-1}$   
 C.  $1.05 \times 10^{-6} \text{ mol L}^{-1}$   
 D.  $1.05 \times 10^{-5} \text{ mol L}^{-1}$

**Answer: D****Solution:****Solution:**

$$K_{\text{sp}} = S \times S = S^2$$

$$1.1 \times 10^{-10} = S^2$$

$$S = 1.05 \times 10^{-5} \text{ mol L}^{-1}$$

**Question 92**

**If two molecules of A and B have mass 100kg and 64kg and rate of diffusion of A is  $12 \times 10^{-3}$  then, what will be rate of diffusion of B ?**

**Options:**

- A.  $15 \times 10^{-3}$   
 B.  $64 \times 10^{-3}$   
 C.  $5 \times 10^{-3}$   
 D.  $46 \times 10^{-3}$

**Answer: A****Solution:****Solution:**

According to Graham's law,  $\frac{r_A}{r_B} = \sqrt{\frac{M_B}{M_A}}$

Here,  $M_A = \left(\frac{100}{2}\right) \text{ kg/molecule}$ ,

$M_B = \left(\frac{64}{2}\right) \text{ kg/molecule}$

$r_A = 12 \times 10^{-3}$  and  $r_B = ?$

$$\frac{12 \times 10^{-3}}{r_B} = \sqrt{\frac{64/2}{100/2}} = \sqrt{\frac{64}{100}} = \frac{8}{10}$$

$$r_B = \frac{12 \times 10^{-3} \times 10}{8} = 15 \times 10^{-3}$$

## Question 93

**Buna-N synthetic rubber is obtained by the copolymerisation of**

**Options:**

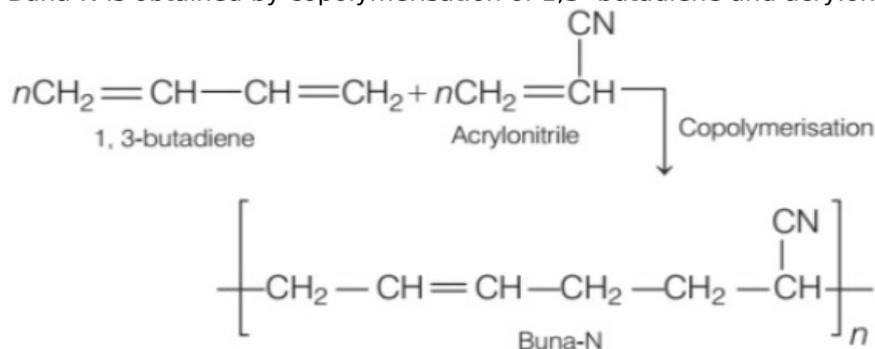

- A.  $\text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$  and  $\text{H}_5\text{C}_6 - \text{CH} = \text{CH}_2$
- B.  $\text{CH}_2 = \text{CH} - \text{CN}$  and  $\text{H}_2\text{C} = \text{CH} - \text{CH} = \text{CH}_2$
- C.  $\text{H}_2\text{C} = \text{CH} - \text{CN}$  and  $\text{CH}_2 = \text{CH} - \text{C}(\text{CH}_3) = \text{CH}$
- D.  $\text{H}_2\text{C} = \text{CH} - (\text{CCl}) = \text{CH}_2$  and  $\text{H}_2\text{C} = \text{CH} - \text{CH} = \text{CH}_2$

**Answer: B**

**Solution:**

**Solution:**

Buna-N is obtained by copolymerisation of 1,3-butadiene and acrylonitrile in the presence of a peroxide catalyst.

## Question 94

**The oxidation number of oxygen in oxygen difluoride ( $\text{OF}_2$ ) and dioxygen difluoride ( $\text{O}_2\text{F}_2$ ) respectively is**

**Options:**

- A. +1 and +2
- B. +2 and +1
- C. +1 and +1
- D. +2 and +2

**Answer: B**

©

## Solution:

### Solution:

In oxygen difluoride ( $\text{OF}_2$ ) and dioxygen difluoride ( $\text{O}_2\text{F}_2$ ), fluorine gains electron with negative charge as F is more electronegative than O. Thus, O will have positive charge.

$\therefore$  Oxidation number of O in  $\text{OF}_2 = +2$

$\therefore$  Oxidation number of O in  $\text{O}_2\text{F}_2 = +1$

---

## Question 95

The correct order of radii of  $\text{F}^-$ ,  $\text{F}^-$ , O and  $\text{O}^{2-}$  is

### Options:

A.  $\text{O}^{2-} > \text{F}^- > \text{F} > \text{O}$

B.  $\text{F}^- > \text{O}^{2-} > \text{F} > \text{O}$

C.  $\text{O}^{2-} > \text{O} > \text{F}^- > \text{F}$

D.  $\text{O}^{2-} > \text{F}^- > \text{O} > \text{F}$

**Answer: D**

### Solution:

#### Solution:

Radii of the given species vary in the order.

$\text{O}^{2-} > \text{F}^- > \text{O} > \text{F}$

The size of the anion is larger than their parent atom. Also, the more the nuclear charge, the lesser is the size.

---

## Question 96

Which of the following can reduce?  $\text{RCOOH} \rightarrow \text{RCH}_2\text{OH}$

### Options:

A.  $\text{NaBH}_4$

B.  $\text{Na} / \text{C}_2\text{H}_5\text{OH}$

C.  $\text{BH}_3 / \text{THF} / \text{H}_3\text{O}^+$

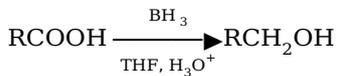

D.  $\text{H}_2$  /catalyst

**Answer: C**

### Solution:

**Solution:**

The reduction of carboxylic acids to alcohols is carried out by  $\text{LiAlH}_4$  and boranes ( $\text{BH}_3$  or  $\text{B}_2\text{H}_6$ ) in THF.

---

## Question 97

Which of the following trend is correct with respect to the reactivity of alkalimetal oxides with water?

**Options:**

- A.  $\text{Li}_2\text{O} > \text{Na}_2\text{O} > \text{K}_2\text{O} > \text{Rb}_2\text{O} > \text{Cs}_2\text{O}$
- B.  $\text{Cs}_2\text{O} > \text{Rb}_2\text{O} > \text{K}_2\text{O} > \text{Na}_2\text{O} > \text{Li}_2\text{O}$
- C.  $\text{Li}_2\text{O} > \text{Na}_2\text{O} > \text{K}_2\text{O} < \text{Rb}_2\text{O} < \text{Cs}_2\text{O}$
- D.  $\text{Na}_2\text{O} > \text{K}_2\text{O} < \text{Li}_2\text{O} < \text{Rb}_2\text{O} > \text{Cs}_2\text{O}$

**Answer: B**

**Solution:****Solution:**

Down the group, reactivity of alkali metal oxides with water increases and thus, the reaction of  $\text{Rb}_2\text{O}$  with water and  $\text{Cs}_2\text{O}$  with water are explosive. Hence, the correct reactivity order is

---

## Question 98

Which of the following is an extensive property?

**Options:**

- A. Viscosity
- B. Heat capacity
- C. Density
- D. Surface tension

**Answer: B**

**Solution:****Solution:**

Heat capacity is an extensive property. It is a property that changes when the size of the system changes, whereas viscosity, density and surface tension are intensive properties.

---

## Question 99

Which of the following polymer is used in the manufacture of insulators?

**Options:**

- A. Polyacrylonitrile
- B. Teflon
- C. Bakelite
- D. Nomex

**Answer: B**

**Solution:**

**Solution:**

Teflon is used in the manufacture of insulators, gaskets etc. It is also known as polytetrafluoro ethylene having monomer unit of tetrafluoro ethylene.

---

## Question 100

According to Faraday's first law,

**Options:**

- A.  $W = \frac{96500 \times E}{I \times t}$
- B.  $W = \frac{I \times t \times E}{96500}$
- C.  $E = \frac{I \times W}{t \times 96500}$
- D.  $E = \frac{I \times t \times 96500}{W}$

**Answer: B**

**Solution:**

**Solution:**

According to Faraday's first law,  
 $W = ZIt$  and

$$Z = \frac{E}{96500}$$

$$W = \frac{I \times t \times E}{96500}$$

where, I = current, t = time

E = equivalent weight

W = weight deposited.
